The real truth of the matter is rather this. There is in the spiritual world, both outwardly and inwardly regarded, a Nature of vulgar type, which testifies to its meanness outwardly for the simple reason that its inward content is mean, that is to say, when all that it can realize externally in its activities are the aims of envy, jealousy, and avarice in every detail of sensuous life. Such a poverty-stricken Nature can no doubt form part of the subject-matter of art, and has been treated as such. When this is the case, however, as we have already explained, it is not the subject-matter, but wholly the artistic handling of it, which creates an interest of any permanent character; and the artist will look in vain for sympathy in his subject, or rather the mere material of his subject from the true connoisseur. A particularly pertinent illustration of this type of art is the so-called *genre* painting, which has not shown itself above accepting subjects of this

character, the artistic treatment of which has been carried by the Dutch school to the extreme limit of perfection. It may, however, be as well to ask ourselves, first, what the precise contribution of the Dutch has been to this *genre*-painting, what, in short, is the nature of content their dainty pictures express, pictures which at least have asserted an extraordinary power of attraction and obviously cannot be shelved right away beneath the common stigma of vulgarity. We shall not improbably find, on closer examination, that the subject-matter of these pictures is not so contemptible as it is often taken to be[289].

The Dutch have selected the subject-matter of their artistic production out of their own substance, out of the actual presence of their daily life. To have once for all realized that presence even in art is no matter of reproach to them. To estimate the character of their artistic interest we must view them in close connection with the actual panorama of their own times. This is a problem of history. The Dutchman has in great measure himself created the ground wherein he lives and finds a home, and has been forced continuously to preserve and defend that home against the invasion of the sea. The citizens of the towns no less than the rural population have together, through courage, endurance, and bravery, repulsed the power of Spain in the hands of Philip II, son of Charles V, the sovereign of a world-wide empire, and in fighting their battle for civic freedom, they were fighting that of religious liberty. This staunch sense of citizenship, this passionate love of enterprise in the narrow limits of their fatherland, no less than abroad on the high seas, this careful and at the same time clean and dainty mode of life, together with the geniality and invincible self-respect which distinguishes them, all this is as much the fruit of their own actions as it is the general content of their artistic production. Such a content as this is no common material, though obviously it is not of the kind we must suppose we can approach with the supercilious superiority of critics for

whom the exalted taste of courts and fine society is everything. From a sterling national self-consciousness of this sort Rembrandt painted his famous "Night-Watch" now in Amsterdam, Van Dyck so many of his portraits, Wouvermans so many of his battle-pieces; nor should even those reflections of rustic drinking-bouts, jovialities, and other scenes of merriment be wholly excluded from the category. And in illustration of its excellence we would point, by way of contrast, to a work in this year's exhibition, which, though not downright bad *genre*-painting, is much inferior to the handling by old Dutch masters of similar subject-matter, coming nowhere near to their freedom and joy of life. In this picture a housewife is seen entering an alehouse to give her husband a good scolding. Here we have just a scene of cantankerous and waspish human-kind and nothing more. These Dutchmen painted their folk very differently; whether we find them among their cups, at weddings or dances, feasting or drinking, nay, even when the matter proceeds to ribaldry and blows, liveliness and lustiness is the prevailing temper. Young maids and women laugh with the rest, and a feeling of free and abandoned merriment carries all before it. This intimate delight in all enjoyment justifiably human, which will even absorb itself wholly in animal life and crop up at times as mere satiety and grossness; this freshly awakened sense of freedom and life, fully grasped and embodied in composition and colour, is what constitutes the higher spiritual import[290] of these Dutch pictures.

On much the same grounds the beggar boys of Murillo, in the central gallery of the Munich collection, are excellent. Superficially regarded, the subject here, too, is of a vulgar character. The mother is scolding one of the youngsters, as he quickly munches a piece of bread; two others hard by, ragged and poor, are eating melons and grapes[291]. But in this very poverty of half-nakedness what gleams forth from the entire composition as the soul of that beggar life is its complete carelessness and spontaneity. No dancing

dervish himself could give it us more frankly in its impression of entire health and jubilant vitality. This freedom from all external care, this inward liberty reflecting itself in that which is visible, is precisely that which the notion of the Ideal demands. There is in Paris a certain portrait of a boy by Raphael; the head leans propped at leisure on one arm, and gazes with such ecstasy of careless contentment into the open landscape that we are loth to turn away from a picture expressive of such health and exuberant animation. We receive a delight of very much the same nature from these lads of Murillo. It is obvious enough that neither their objects nor their interests aim high, but this is no result of stupidity; there they chaffer on God's earth with, we may almost say, the bliss and contentment of the Olympian gods themselves. They, too, have their business; but though we hear little about it they are a genuine sample of humanity, neither morose nor discontented with their lot. Feeling this ground-root in them of all sterling performance we can readily imagine that in favourable conditions youth such as this might be capable of most things. A composition of this kind is entirely on a different level from the one above mentioned of the scolding housewife, or two others we might also contrast with it, of a certain peasant mending his whip and a postillion sleeping on a straw pallet[292]. Such paintings of *genre* should unquestionably be of small size; and, indeed, in their total impression on the sense, they must be made to appear of comparative insignificance, that we may not feel the character of their subject-matter and its presentment has received undue prominence. It would be intolerable to have such subjects painted life size as though the fulness of the reality were sufficiently attractive to claim our attention.

Such are the principles which should regulate our artistic treatment of and sympathy with that which it is usual to stigmatize as mean or vulgar in ordinary life.

There is, no doubt, plenty of material for art to appropriate of higher grade than the representation of animal spirits and downright citizenship in all their essentially insignificant detail. Man has clearly more serious interests and objects than these, interests which have unfolded as his own spirit has widened and deepened, and in harmony with which it is his truest interest to remain. An art will take highest rank which sets before itself the task of giving adequate representation to this more vital, or at least more profound, content. And here at once we are confronted with the old question, what is the source which will supply us with the forms most fitting to such creations of mind. On the one side theorists maintain the opinion that, inasmuch as the artist creates these lofty ideas, which he desires to clothe in artistic form, he must, also supply their artistic forms, create, for example, from his imagination the ideal figures of Greek gods, Christ, his apostles, saints, and so on. In strenuous opposition to this view Herr von Rumohr has entered the lists. This writer is of opinion that art is on a false track in supposing that the artist discovers the forms of his production in himself rather than in Nature, and it is under this conviction that he has reviewed the masterpieces both of Italian and Dutch painters. On this head he finds it a matter of censure ("Italian Investigations," i, p. 105) "that the theory of art, during the sixty years which have elapsed, should be at the pains to prove that it is an object, or rather the main object, of art to improve upon creation as it is particularised, and by doing so to substitute forms which have no particular relation to anything, which would ape Nature's creation by going several points beyond her, and release mortal man from all responsibility for the fact that Nature has not known how to make her appearance more beautiful." And consistently with such a point of view he further advises the artist "to have nothing to do with the gigantic task of attempting to ennoble or elucidate the natural form, or attempt any such exalted function of the human Spirit under what name soever it may be

written down in works upon art" (*ibid.* p. 63). He is, in short, wholly convinced that, however exalted and spiritual[293] the subject to be treated may be, completely adequate forms are to be found in Nature as immediately perceived, and consequently maintains (p. 83), "that the exposition of Art, even in the case of subject-matter as highly *spiritual* as it is possible to conceive, is never indebted to a symbolism capriciously created by man[294], but depends wholly for its consistency upon what is presented as significant by Nature in organic form." No doubt in advancing this Herr von Rumohr has particularly under review the ideal types of antique art as they are expounded by Winckelmann. It is for all that the abiding service of Winckelmann to have pointed out and set forth in harmonious relation these very types, although he may doubtless have, committed errors of judgment with regard to particular masterpieces while carrying through the same. As a possible example of such an oversight Herr von Rumohr thinks he has made out (p. 115) that the increase of length in the lower half of the body, which Winckelmann has characterized as an ideal feature of the antique, is really borrowed from Roman statuary. And naturally enough, as an opponent of the Ideal, improves the occasion by insisting that the artist should unreservedly take Nature into his confidence in the study of form. Here, and here alone, he will find the presence of true beauty. To quote this writer once more it is affirmed (p. 144), "that the beauty of most importance depends on a symbolic of forms rooted in Nature rather than human caprice, a beauty through which these forms are nourished into their characteristic and symbolic relations, in the vision of which we necessarily have brought back to our memory definite images and conceptions, and are made more definitely conscious of previously dormant feeling.[295]" I And so finally it appears that in this writer's view (p. 105) "a mysterious trait of our spiritual life, what many would perhaps call Idea, seems to bind together the artist and the appearances of Nature, in which

latter he is constantly and continuously learning to recognize the true character of his own artistic purpose[296], and to find himself in a position through them to give expression to it."

There can be no question, of course, that ideal art has no business at all with "a symbolism capriciously created;" and, if it really is the case that these ideal types of the ancients have been composed only to reduce the veritable forms of Nature to false and empty abstraction, we may freely admit that Herr von Rumohr is justified in his most trenchant opposition.

For our own part we would emphasize the points of fundamental importance to be grasped in this antithesis between the ideal of art and Nature as follows:

The forms which are borrowed from immediate Nature to determine an ideal content must be assumed to be thus taken symbolically in the usual sense of the term, namely, that they are not thus immediately significant in themselves, but only as the external embodiment of that which is inward and spiritual, the content, in fact, they express. It is only Spirit, even in the reality which they possess outside the limits of art, which constitutes their ideality in its contrast with that they entirely owe to Nature simply as such, and which is unable to reveal to us what is essentially mind. It is the object of art, on its more noble plane, to give external shape to the inward content of Spirit. This content we discover in the conscious life of men realized in the world. As such it possesses — we include with it our conscious human experience generally — an external semblance directly presented in and through which it finds expression. So much may readily be conceded. At the same time from a philosophical point of view it is simply futile to inquire whether we ought to look to the direct facts of Nature alone for objects and physiognomical traits of beauty and expression to serve as entirely adequate materials for art's representation, shall we say, of the majesty, repose, and power of a Jupiter or of a Juno, Venus, Peter, Christ,

Madonna, or any other divinity, or saint. Arguments may be supported on either side, and the question can only remain finally undecided, being wholly empirical. For the only sufficient way of deciding the matter would be to contrast what is borrowed with the realities it purports to represent, and this, in the assumed case of the Greek gods, might be matter of some difficulty; and, to take the present day, one man will see traits of beauty in their perfection where another a thousand times more acute will see nothing. But over and above such considerations we must observe that the mere beauty of form will never give us that we have named the Ideal, inasmuch as the individuality of the content is a constituent part of it, and therein form is necessarily included. A human face, for example, may be both regular and beautiful in its outlines and yet remain cold and devoid of all expression. The ideal figures of the Greek gods are, on the contrary, true individualizations; the universality of their ideal conception does not exclude the characteristic determination which belongs to each of them. And the vitality of the Ideal consists just in this, that this determinate and fundamental spiritual significance, which it is the function of art to exhibit, should wholly transfuse by appropriate artistic treatment all the particular aspects of the external embodiment, such as composition, pose, motion, physiognomy, and configuration of limbs, so that nothing empty or insignificant should be left, but the entire work should reflect that ideal significance. All that we have learned from Greek sculpture in recent times of a quality which, in fact, emanates from the school of Pheidias, is characterized by nothing so much as this penetrative vitality. The Ideal is preserved in all its severity without any lapse in the direction of mere grace, softness, elegance, and exuberance, yet retains the form in close relation to the ideal significance which should be embodied throughout the whole. This supreme vitality is the distinguishing mark of the great artist.

We may call a typical significance of this kind, in contrast to the particularity of the external world, essentially abstract. This is pre-eminently the case in sculpture and painting, arts which illuminate but a momentary state, without proceeding to such a varied development of exposition as we find, for example, in that where Homer is able to depict the character of Achilles as mild and courteous no less than severe and terrible, to say nothing of all his other characteristics. No doubt it is possible to find such a significance expressed in purely immediate reality. There are, for instance, few countenances which cannot reflect the moods of piety, devotion, and cheerfulness; but such faces also express countless other moods which either are quite inappropriate to that ideal significance, or are only indirectly related to it. For this reason it is by virtue of its particular realization that a portrait acquaints us of the fact that it is a portrait. In many old German and Flemish pictures we find the patron of the picture included in the composition with his entire family of sons and daughters. All are necessarily painted as though taken in an act of devotion, and this spirit illuminates every countenance; but at the same time we have quite as clearly set before us in the men stalwart warriors, men of vigorous action, disciplined on the strenuous field of life and commerce, and in the women dames of an equally doughty life-experience. If we compare with such faces — and we may restrict our comparison wholly to these very pictures, which are famous for their close approach to Nature in their delineation of physiognomy — those of the Virgin Mary, and the saints and apostles who surround her, we shall find in these latter one preponderating expression; and all the physical lineaments, whether we look at build of bone, structure, or muscle, traits of that express motion or repose, are concentrated upon this one artistic effect. That which is felt to be appropriate to the one class and not to the other exactly differentiates the distinction between the genuine Ideal and mere portraiture.

Some may imagine it possible for the artist to compose the ideal content of genuine types by a process of sifting and selection from the facts of immediate Nature, or quite possibly from the various physiognomies and compositions which collections of engravings from the copper-plate or the wood may furnish. But a process such as this of mere collection and sifting is not the end of the matter. An artist must maintain the creative impulse alert throughout. He must himself, in the strength of his own imagination, already impregnated with the knowledge of appropriate form and made vital with profound experience and emotion, give such an embodiment to the significance, which is the inspiring motive of the work, as will make it appear throughout as metal cast at one time and is one state of fusion.

B. THE DETERMINACY OF THE IDEAL

To comprehend the Ideal in its intrinsic significance, that is to say, according to its fundamental notion, was a comparatively easy task. But the beauty of art, in so far as it is the Idea, is not to be restricted to the purely universal standpoint of its notional concept; even as so comprehended it must necessarily include within it determination and particularity, and is compelled to take definite embodiment as external reality. The question consequently arises in what way is the Ideal able still to assert itself in this process of objectification in the medium of external things and their finitude, and despite all that is antagonistic to ideality; and as a corollary to this we have to inquire how finite and determinate existence is enabled to attach to itself the ideality of the beauty of all art.

We propose to regulate this inquiry with the following division of our subject matter.

First, the determination of the Ideal in its simplest terms.

Secondly, the determination of it, in so far as it proceeds by virtue of its particularity to a condition of *discordant parts* within itself and to their

resolution, a condition we may generally, define as *action*[297].

Thirdly, the determination of the Ideal from the point of view of it as an *external object.*

I. THE IDEAL DEFINITION AS SUCH

1. We have already observed that it is the function of art to make the Divine the focus or centre of its entire exposition. It is, however, only possible for thought in its pure medium, that is to say, apart from all the sensuous material of the figurative imagination, to comprehend the Divine in its essential significance of *unity* and *universality.* To attempt to do otherwise, by imagining a picture of God more readily grasped by the perception of the senses, is, as we know, forbidden both Jews and Mahommedans. This cuts away the ground of the figurative arts, which absolutely require form as their medium in all its concreteness of actual life; and we have only lyrical poetry left us to celebrate in its exaltation the praise of His power and glory.

2. Considered, however, from the reverse point of view, we must equally assert that however much unity and universality are predicable of the Divine, He is in His essential substance determined, and, so far as He withdraws Himself from the pure quality, of such predicates in their abstraction, is thereby an object for the figurative sense and external perception. If the Divine is consequently apprehended and figuratively embodied for us through the forms of the imagination, we are at once confronted with a possible variety in such determination; and it is at this point that the actual realm of ideal art finds its commencement. For, in the *first* place, the one Divine substance disunites and breaks itself up into a multiplicity of self-subsistent gods, such as we find presented by the polytheistic system of Grecian art; and even in the religious consciousness of Christianity God is, in opposition to His purely spiritual unity, immediately revealed on Earth and in the world-process as man. And,

secondly, the Divine, regarded generally in its determinate appearance and reality, is both present and realized in emotional feeling, will, and the education[298] of mankind. For this reason and in this sphere men who are filled with the Spirit of God, saints, martyrs, and, in short, all who share in the religious life, are equally the appropriate subject of ideal art. With this principle of the individuality of the Divine and its determinate existence realized necessarily in the world-process, we are face to face with — and this is the *third* point to be considered — the particularity of human existence. For the entire world of human emotion, with all that stirs it most profoundly — and what a power is implied in that open sea of feeling and passion, everything of deepest interest to the human heart — this entire content is nothing less than its exposition and expression. If it is true, then, that the Divine in its purest essence of reason is only the object of the thinking consciousness, it is equally true that Spirit, which takes to itself an actively bodily presence, so far, that is to say, and only so far as we find it reverberate in the heart of humanity, all this lies within the sphere of art. Once admit this, and we must admit the content of particular interests and actions, specific characters, and momentary situations, in short, the entire process of development in the external order; and it becomes of first importance to indicate under a general principle in what the relation between the Ideal and this positive determination consists.

3. In conformity with what we have already advanced it is clear that here, too, the Ideal will be most purely manifested in the representation — whether it be of gods, Christ, apostles, saints, or any other type of devout persons — which brings most clearly before us the qualities of beatified repose and satisfaction, a peace undisturbed with that which is earthly, and subject to the storms of life's manifolded complexities, struggles, and contradictions. We are therefore not surprised to find that both the arts of sculpture and painting have been peculiarly fitted to incorporate under ideal

form not merely the ancient gods, but Christ as saviour of the world, and individual apostles and saints. That which is the most essential truth in actual life is concentrated to a focus on itself in the determinate embodiment of art, rather than continually forced from its serenity through dependence upon finite conditions. This essential concentration is not destitute of particularity, but the divergent separation, which is a feature of the external and finite state, is purified to one simple definition, so that it appears as though all traces of external influence and the relation thus created were overcome. This deedless and infinite self-repose, this "taking a rest," as we find it, for example, in certain statues of Hercules, is just what constitutes the significance of the Ideal. If the gods are represented in contact with the process of Nature, they must still carry with them their immortal and unapproachable majesty. Jupiter, Juno, Apollo, Mars, and their like are, it is true, definite personalities, but they are at the same time unyielding potentates and powers, which preserve within them their self-subsistent liberty, even when they are actively related to the world. And for this reason it is not merely that a specific particularity must characterize the determinacy of the Ideal, but spiritual freedom must be manifested thereby as totality, and in this state of repose suggest the potency of unfettered freedom of action. If we turn now from the gods to the less exalted plane of temporal existence and human life, we shall find the Ideal active in its representation of the substantial content of such humanity, and its dominant repression of wholly subjective particularity. By this we mean that all that is entirely isolate in feeling and action is wrested from the element of contingency, and particularity is represented in its concreteness, that is to say in its wider bond of relation with what most truly and intimately belongs to its life. When, for instance, we speak of the nobility, excellence, or perfection in particular men, we assert in so many words that the substantial core of what is spiritual, ethical, and divine has announced itself

as prevailing in the individual, and man has submerged his active life, his volitions, his interests, and passions wholly in this substantive basis, that he may thereby give full satisfaction to the most authentic necessities of his soul.

At the same time, however much in the case of the Ideal the determination of Spirit and its external presence appears to be absorbed in the simple self-relation, the principle of *development* is likewise directly associated with the particularity unfolded[299] in determinate existence, and along with this in that relation to environment which necessitates both the opposition and conflict of clashing forces. This fact necessitates a closer examination of the determination of the Ideal regarded in this very aspect of differentiation and process, an aspect which we may in a general way define as *action*.

II. THE ACTION

The gracious innocence of beatific enjoyment, the inactive repose, the majesty of power in self-reliant tranquillity, as also the concentrated compactness generally of that which is most substantial in a given content — all these are essentially ideal modes of determination. That which is inward, however, and spiritual is in an equal degree active movement and development. One-sidedness and division are inseparable from development. Spirit that is wholly itself and a totality will, expanding into all particularity, step forth out of its repose, in despite of all satisfaction therein, and involve itself in the contradictions of the broken and confused medley of earthly existence, and is by so doing unable in this divided world to withdraw itself from the ill-fortune and ill-health that clings to finite existence.

Even the immortal gods of Polytheism do not dwell in eternal peace, but take sides in mighty conflicts wherein contending passions and interests are roused, being subject themselves to Destiny; nay, more, even the God of

Christians is, not delivered from a passage of humiliation endured through suffering and shame of death, is not spared the bitterness of soul, which perforce cried aloud: "My God, my God, why hast thou forsaken me." And the mother of Christ experienced an agony of the same poignant character, and human life in every direction is a life of struggle, battle, and pain. For greatness and force of character is evolved in the greatness and force of contending elements, out of which Spirit concentrates itself again and again upon its unity. The intensity and depth of subjectivity is only the more emphasized, the more unbroken and unexampled the resistance of circumstances to its unity grows, and the more irreconcilable the contradictions appear under which it has to preserve its own self-centred equilibrium. In this development and through this alone the might of the Idea and the Ideal is preserved, for power consists precisely in this self-preservation through a process of self-negation.

Inasmuch as it is the fact, then, that the particularity of the Ideal passes into a relation with the external world through such development, and by so doing is made partaker in a world, which, so far from manifesting the ideally free association of the notion and its external reality, presents an existence which is just that which it ought not to be, in apprehending the true nature of this relation we have to consider how far the determinations which affect the Ideal either in themselves contain immediately the principle of Ideality, or are to a more or less degree susceptible of it.

In this connection we would direct attention to three fundamental points of view.

In the *first* place we have the *actual condition* of the *world generally*, which is assumed as involved in individual action and its specific character. *Secondly*, we have the *particularity* of condition, the determination of which introduces difference and tension within the substantive unity, which is the motive-spring of the action, in other words the *situation.*

Thirdly, we have to consider the situation from the side of subjectivity, and furthermore the reaction by virtue of which the conflict and resolution of the element of difference is expressly asserted, in other words, the *action* in its strict sense.

1. The universal World-condition

The ideal subjectivity is as such essentially a personal relation, a relation, that is to say, of self to every aspect of motion or activity, in which the self has to assert or perfect its own substance. And to effect this a world environment is necessary as the universal ground of its realization. When in reference to this we speak of *condition* we understand by this the universally prevailing mode, under which, within the sphere of spiritual reality, that which is the *substantive* and essentially coalescing fabric of the same is present. In this sense we refer to a *condition* of education, the sciences, the religious sense, or even of finance, administration of justice, family life, and similar examples. All these objects of reference are, however, merely aspects of one and the same spiritual content, which is thus in and through them rendered explicit and real. In further considering the general condition of the world as the universal mode of the reality of Spirit it will be necessary to pursue our examination from the point of view of the *Will.* It is through the exercise of volition that Spirit generally unites itself to-determinate existence; and the substantial *nexi* which are immediately present in reality betray themselves in the specific modes in which the determinations of Will, ethical and legal conceptions, and, indeed, all that belongs to that which we are accustomed, in a general way, to define as justice, actively asserts itself.

The question consequently arises how such a universal condition must be characterized in order that it may appear adequate to the individuality of the Ideal.

(*a*) Pursuant to the foregoing considerations we may, to begin with, emphasize the following points:

(*α*) The Ideal is essential unity; not a purely formal and external unity, but the immanent unity of the content in itself. This substantive repose on its own resources we have already characterized as the self-sufficiency, rest, and beatitude of the Ideal. We will, in direct relation to the plane of discussion we have now reached, develop this characteristic of *self-subsistency*[300], making it a primary demand of our argument that what we have termed the general condition of the world appear in such a self-subsistent form as will enable it to accept the embodiment of the Ideal.

(*αα*) Now self-subsistency is an equivocal expression to start with. In ordinary parlance that which is essentially substantial is called simply self-subsistent by virtue of the element of causation being implied within this substantiality; we are wont to use it in this sense when describing the intrinsically divine and absolute. But as retained in this universality of substance merely as such it is not declared as itself subjective, and consequently meets with its irresolvable contradiction in the particularity of concrete individuality. In this bare antithesis all true self-subsistency disappears.

(*ββ*) On the other hand, it is not uncommon to find such subsistency ascribed to purely formal individuality, consisting solely in its self-reliance upon the fixed determinacy of its subjective characteristics. This subjectivity, however, in so far as the actual content of life drops away from it, so that the forces and substances which lie without it acquire in themselves an independent stability, and as such confront the subject and the inward life as a content wholly unrelated, lapses through this, too, into unequivocable contradiction with the actual substantiality of determinate existence, and forfeits all claim to self-subsistency and freedom of content. True self-subsistence consists alone in the unity and interpenetration of both

individuality and universality with each other. The universal acquires through the individual a concrete existence; the subjectivity of the particular thing discovers for the first time in the universal the unassailable basis and the most genuine form of its realized totality.

(*γγ*) Consequently in making this demand of the universal world-condition we must ask for a form of self-subsistency in the same sense, namely, that the substantially universal in such a condition must contain within itself as the vehicle of its self-subsistence the form of subjectivity. The most obvious presentment of this identity is that of thought. For if thought is, in one aspect of it, subjective, in another it possesses universality as the product of its inherent activity, and encloses both universality and subjectivity in unfettered unity. The universal of thought is, however, not that of art, whose object is the beautiful. And, indeed, apart from this distinction, particular individuality as confronted by thought in its natural envisagement, or form, no less than in its active effects and complete realization, stands in no necessary correspondence with the universality of thought. There is, for example, a clear distinction between the subject apprehended in its concrete content of the actual world and that which is simply the thinking subject, or at least it is open to such a distinction. The same kind of cleavage affects the form of the universal itself. In other words the moment the universal begins to assert itself in distinction from its otherwise related reality by that act it has in *objective* existence separated itself from all the varied play of its phenomenal particularity, and, in opposition to the same, has already established an independent position assured and powerful.

In the Ideal, however, it is precisely the particular individuality which ought to persist in inseparable co-ordination with the substantive reality, and to the full extent that freedom and the self-subsistency of the subjective principle may attach to the Ideal the world-environment of conditions and

relations should possess no essential objectivity independent of the individual in the subjective aspect above referred to or already presupposed. For the ideal individual is a self-enclosed totality, which already includes the objective principle, and it must not be permitted to have independent motion and development apart from the individuality of the subject; otherwise the subject falls back into a purely subordinate position in contrast to a world whose independence is already assured. Consequently the universal must indeed be actual in the individual as that which is in a unique sense its own, but not so as the property of the individual, as a *thinker*, but as that of his *character* and *temperament.* To put the same truth in another way, what is required for this unity of the universal and individual in art as opposed to the mediation and differentiation of thought, is the form of *immediacy*; and the self-subsistency which we claim here is the form of immediate self-subsistency. With that, however, the element of *contingency* is associated. That is to say, so long as the universal and effective[301] constituents of spiritual life, such as the self-subsistency of individuals exhibits, are only presented to us in the immediate guise of subjective feeling, temperament, and disposition of character, and debarred any other category of existence, such are thereby already given over to the contingency of volition and its realization. All we have left us, then, is what is peculiar to each individual viewed as such and his sensuous experience. Such a possession of what is nothing more than personal idiosyncracy is unable to assert for itself any further potency or necessity; it appears simply as inclusion of content, fixed achievement and at the same time arbitrary commitment of the wholly self-dependent subject to the influence of feeling, disposition, energy, general ability, cunning, and talents, instead of carrying out its realization over and over again according to a principle of universal import and acknowledged stability.

This type of contingency, then, is the characteristic quality of the condition which we required for the ground upon which all the varied wealth of the Ideal is to appear.

(*β*) In order to make more clear the actual character of the reality which is most adapted to artistic treatment we will contrast it with that aspect of existence which is not so adapted.

(*αα*) We find this pre-eminently where the ethical notion, that is, justice and rational freedom, have already won for themselves and maintain a fixed position in the social *order* regulated by *law*, so that, even in the external world, it appears as a positive and necessary power, which is quite independent of the individuality and subjectivity of specific temperament and characters. This is the case in the life of the *State*, where that life is manifested in a form adequate to the true notion of citizenship. For obviously it is not every chance association of human beings, any more than every patriarchal community, that will fulfil the requisites of State-life. In the true State laws, customs, and rights, in so far as they constitute the determinations of freedom applicable to all, are of paramount force even in this *universal* and abstract relation, and are not conditioned in their applicability by the chance requirements of any individual's idiosyncracy. As the consciousness of society has issued for itself commands and laws in a mode of statement of general application, in the same way these are externally valid as such universal fiat, which proceeds in the path of order thereby indicated, armed with powers of restraint and compulsion against any individual who may attempt to assert his caprice in an injurious opposition to such regulations.

(*ββ*) Such a condition at once assumes a dividing line between the universal ordinances of the regulative understanding and the immediate life, connoting by this latter term the unity in which all that is substantive and

essential in morals and the conduct of justice only finds a form for its existence in the experience of *individuals*, their ethical feeling and opinion, that is to say, and thereby alone is exercised. In the civilized State right and justice, even religion and science, or, at any rate, provident interest in religious and scientific education, are subject to *public* control, which directs and co-ordinates the same.

(*γγ*) The position, then, that isolated individuals occupy in the State is one which contracts them within a fixed and organized order, and subordinates them thereto; and they stand in this relation for the reason that the character and disposition of each is not the only embodiment of ethical forces; but, if the State to which they belong is a genuine example, they are on the contrary compelled to regulate all the external detail of their actions, opinions, and feelings with a due regard to what is legally permissible, and to bring the same into line with it. This dependence upon the objective rationality of the State in its power of self-assertion above all subjective caprice may either be regarded as a mere subjection, inasmuch as laws and institutions possess, as the paramount power, a constraining force, or we may see in it merely the free recognition and acceptance of the reason that underlies such a necessity of fact, an acknowledgment through which the individual finds himself again in that objective order.

But even in the latter case isolated individuals continue to remain as merely incidental facts, and apart from the organic reality of the State possess no real substantiality in themselves. For substantiality, in the sense we here use the term, is by no means only the *particular* property of this or that individual, but a fully *explicit* reality[302], minted, as it were, in all aspects of it, and down to the merest detail in a mode universally applicable and *necessary.* All that mere individuals can effect with *volition* and *accomplishment* even in actions right, moral, and legal in themselves in the interest of and attendant upon the progress of the whole, remains and must

always remain, in contrast with that whole, insignificant and a mere example. Their actions are always only an entirely partial realization of a single case; and, moreover, the realization of the same has no universal significance in the sense that the particular example of it is thereby of objective validity as law, or, as such law, makes its appearance. And for the same reason, to put the matter the other way, it is wholly unimportant whether the validity of right and justice is acknowledged by private individuals judging as individuals. The validity is a vital fact of State life which holds whether it be acknowledged or no. No doubt it is a matter of interest to the general public that every one should fall in with the order established and desire it; but the wishes of isolated individuals have no influence upon that interest in the sense that it is only by virtue of the assent of this or that person that right and a moral order is preserved. Such require no such isolated example of assent; and a breach of either is followed by punishment.

The subordinate position of private persons in the civilized State is finally emphasized in the fact that, whatever share any one may have in the general civic life, it is of a definite and in every case restricted character. In the real State work must have some relation to the general good[303], just as the active enterprise of the bourgeoisie in the commercial business is subdivided in the most varied way, so that the entire life of the State shall not appear as the concrete achievement of any *single* person, or in general can be entrusted to the arbitrary wishes, enterprise, courage, resources, and discretion of such, but on account of the fact that it comprises activities and trades of countless complexity, and must be carried out by associations of business men at least as varied. The punishment of a criminal is no longer an affair of personal heroism or the virtue of any *one* individual, but is throughout the entire process, in the investigation and discovery of the felonious act, in the pronouncement of judicial sentence and its execution,

contributed to by different persons; nay, every important phase of such a process is in the same way subject to some kind of division of labour. To see that the laws are properly administered, then, is not within the special province of any *one* man, but results from an organized effort of great variety and the rules which direct it. Add to this every man who assists in such a process is bound to follow certain general principles which are laid down for his guidance, and all that is carried out under their direction is further subject to the criticism and control of yet higher officials.

(*γ*) In all such civic relations, then, we find that in a truly regulated State the public authority is not impressed with the imprimatur of any single person, but it is the general Will which prevails here in its universality, a condition under which the particular life of the individual has the appearance of vanishing or, at least, of becoming of a quite subsidiary importance. In a condition of things such as this the self-subsistency we were seeking for is out of the question. And for this reason we required for the free embodiment of individuality conditions which are precisely the reverse of this, in which the validity of the ethical principle derives its support from individuals, and only from individuals, men who make for themselves a great place in the arena of life through the activity of exceptional volitional power and the inherent greatness and effectiveness of their character. With such right is simply that which they choose to accept as such; and if that which is essentially moral is compromised by their action, there is no all-constraining public might which brings them to judgment and exacts punishment, but only the right of that inner voice of necessity, which accentuates itself as vital in particular character and through external circumstance and condition and only thus is actually existent. This is what differentiates *punishment* from *revenge.* The punishment exacted by law asserts the validity of the generally applicable and carefully defined right against the violation of that right, and makes use

of the public power according to a definite process as its instrument, in other words, it employs a tribunal and a judge, an instrument to which personality is attached as something accidental. Even revenge may in a similar way find a justification; but such as it has is based entirely on the *subjective conscience* of those who deal with the criminal act, and, in pursuance of their own *private* convictions, avenge themselves on the unrighteous act and its perpetrator. The revenge of Orestes is, for example, justifiable; but he exacted it under the direction of the law which his own virtue prescribed, not as the execution of a judgment and a right. In the condition, then, that we claim as the most suitable for artistic treatment, that which is moral and just must be throughout personal, in the sense that its source is exclusively in the individual life, and it only is actual in such dependence. Moreover, to proceed with our contrasted conditions, in regulated States the external environment of man is made secure, and properly is protected, and he is only permitted to retain in absolute independence for himself his private views and opinions. But in that condition where the essential features of a State are not found the protection of life and property depends on the isolated energy and courage of each individual by himself, who is compelled to look after his own security and that of everything which belongs to him. Such a condition we are accustomed to identify with the *heroic age.* It is not, of course, our province here either to discuss or decide which of these two contrasted conditions of life is the worthier; suffice it to say that, so far as the Ideal of art is concerned, it is imperatively necessary that this hard and fixed line between the universal as an independent existence and individuality should be removed, however much this distinction may be necessary in other directions for the realization of human existence. The reason of this is that Art and its Ideal is just that universal, in so far as it may be presented to the

perception of the senses, and by such presentment is permitted to enter into the variety and living forms of the world of objects.

(*αα*) What we were looking for, therefore, is supplied us by the heroic age, for it is here that virtue, *ἀρετὴ* in the full sense of that Greek word, creates the root-basis of actions. In this connection it would appear that we must distinguish between *ἀρετὴ* and *virtus* as understood by the Roman themselves. The Romans had already their State, Fatherland, and legal institutions, and as contrasted with the State, as the controlling object of all, they had surrendered personality. To be simply a citizen of Rome, to have one object for the imagination and for every other personal energy to centre itself upon, namely, the fatherland and its sovereign majesty, therein lies the earnestness and grit of Roman virtue. Heroes, on the contrary, are individuals who undertake and accomplish a complete enterprise in consistent reliance upon their personal resources and initiative, and with whom it is consequently a purely arbitrary act of their own when they execute anything in accordance with the moral principle. This immediate unity, however, of what we may call the substantive import and individuality of inclination, impulse, and will is the characteristic of Greek virtue. According to this view personality is a law to itself without any further subjection to a law, judgment, and tribunal of independent subsistence. The Greek heroes make their appearance in an epoch anterior to legal enactment, or they are themselves the founders of States, so that right and social order, law and ethical custom, emanate from them, and persist as their own creation in an indefeasible relation to them. In this way Hercules was regarded so highly by the ancients themselves, and represents an Ideal of original and heroic virtue. His free and self-reliant virtue, with which he championed the right and battled against the monstrosities of men and Nature is not a prevailing characteristic of the age, but belongs to him as an exclusive and unique possession. And we may add he was not strictly

a moral hero, as his reception of the fifty daughters of Thespius in one night[304] clearly shows us; neither would it appear from the tale about the Augaean stables is he pre-eminent for gentility. He is rather the general type of self-reliant strength and resource in its championship of right and justice, to exemplify which he elected summarily and from a free choice to undergo countless toils and labours. It is true that some of his deeds were carried out at the instigation of Eurystheus, but this submission is, after all, rather a formal association than a real one, no connection at least of legal validity or inevitable necessity through which the strength of his self-reliant personality was diverted from its independent course.

The Homeric heroes are of a similar type. No doubt they have their clan chieftain; but the associating bond is no fixed relation already determined by law, which enforces their submission; of their own free will it is that they follow Agamemnon, who is no monarch in the modern sense of the term. Consequently every hero volunteers his own advice, the enraged Achilles acts independently for himself in his separation, and, speaking generally, each and all come and go, act, or take their leisure as they please. In much the same independent position, that is to say, united in no fixed organization, to which they are as individuals entirely subordinate, we find the heroes of Arabian poetry portrayed, and even the Shah-Rameh of Ferdusi furnishes us with similar examples. In latter-day Christendom the age of feudalism and knighthood supplies a fertile field for the free growth of heroic enterprise and the type of individuality which belongs to it. Of such are the heroes of the round table, no less than the heroic circle of which Charles the Great is the focus. Charles is, much like Agamemnon, surrounded with independent chieftains of heroic mould, a union which as such is powerless[305]. He is consequently always compelled to take counsel with them, however much each of them may be influenced by private passions; he may bluster like a very Olympian Jupiter, and none the less

find himself and his undertakings suddenly left in the lurch while his confederates are off on some adventures of their own. The Cid is perhaps the most complete example of the type. He, too, is the ally of a confederacy, the dependent of a king, and is bound to render duty as vassal; but in opposition to this obligation he is pre-eminently influenced by the principle of honour, the purely personal consideration of his own glory, nobility, and reputation[306]. And so in this case also the king can only determine a fixed line of action and make war after consulting and obtaining the consent of his vassals. If this is not given they do not fight, and, moreover, a mere majority of votes is not sufficient to compel them. Every man is independent of his neighbour, and exercises his will and steers his own course as such. We find in the accounts given us of Saracen heroes an equally brilliant picture of self-reliant and still more inflexible personality. Even the Reinecke Fuchs fable is a fresh example of this state of things. Here, it is true, the lion is master and king, but the wolf and the bear sit in council. Even Reinecke and the rest do just what they like; and when there is a general outcry, the sly fellow either gets out of the mess with his story-telling, or manages to make some particular interest of king and queen work to his own advantage, and in his own cunning way talks over his sovereign somehow.

(*ββ*) Moreover, in much the same way that each individual example of this heroic type of *personality* persists in immediate unity with all that he may will, act, and accomplish, a similar unity is further maintained in all the consequences which flow from such initiative. When we ourselves, on the contrary, act or estimate a particular action, we assume that only full responsibility can attach where the individual under consideration is in complete possession of the true nature of his action and its attendant circumstances. If the content of those surrounding conditions is otherwise than that which is present to the agent's consciousness in such a case a man

nowadays will not take upon himself the burden of all that is implied in his action. He will thrust on one side that part of it which he would not have done had he known completely or not misconceived the circumstances, and he only accepts that which was fully under his cognisance and carried out with deliberate intention in conformity thereto. The heroic character makes no such distinction. He adheres simply to all the consequences and makes good his personal responsibility for the whole. Œdipus on his way to consult the oracle meets a certain man, quarrels with him and strikes him. In those days such an act was not a crime at all. He only returned a blow after being vigorously attacked. But the stranger was his father. Œdipus further marries a royal lady. His wife is his mother. Without knowing it he commits an act of shame. On learning the truth he acknowledges such enormities to their full extent, inflicts a punishment on himself as murderer of his father and a man of incest, and this although he was entirely ignorant of the true nature of these acts, or had any intention of doing them. The self-reliant stubbornness and entirety of the heroic character refuses to parcel out responsibility and knows nothing of such distinctions as personal intention and the objective act and its consequences. In the evolution and ramification of an action as we moderns regard it these opposed points of view constantly recur, and guilt is thrown into the background as far as possible. No doubt our view of the matter is more in accordance with *ethical principle*, in so far as the condition of a personal knowledge of the particular circumstances, or the consciousness of an object good in itself, in short, generally the intent of an act, is what materially assists us in our judgment. But in the heroic age, where we find the individual essentially indivisible and the objective act proceeding from himself as entirely his own, each person claims absolutely all that he may do, and refuses to surrender one jot or tittle of responsibility therefor.

To an extent equally minute the heroic figure is separated from the ethical whole, to which he belongs, and his self-consciousness is bound up wholly in substantial unity with that whole. According to the views in vogue now we draw a line of distinction as private individuals between objects which are wholly personal and those which affect the community. The individual acts in all that he does from his own private personality as distinct from others, and views even his actions rather as relative to this than as part of all that is farmed out by the organic whole to which he belongs. We consequently make a distinction between individuals and their families. Such is unknown in the heroic age. The guilt of ancestors adheres to their descendants, and an entire family will suffer for the original defaulter. Men inherit the fatality of guilt and transgression. A condemnation such as this appears to us unjust as an irrational subjection to a blind fate. With us the achievements of ancestors reflect no more honour on children and descendants than the punishments and crimes of such contaminate those that follow after them, and least of all is their private character thus affected; nay, modern opinion is already close to the view that the confiscation of family property is a punishment which violates the profounder conception of liberty. But in the ancient and more plastic totality the individual is not so isolated, but rather a member of his family and race. For this reason the character, action, and fortunes of the family continue to be the private affair of each member of it; and so far from denying the actions of his parents, each man voluntarily accepts them as his own; they live in him, and he is just that which his fathers were, suffered, or transgressed. This appears to us a hardship, but that which we replace it with, this standing alone on our own possessions[307], and the more subjective self-stability thus acquired is also from another point of view only the abstract self-sufficiency of each. The individuality of heroic times is none the less of a more ideal type, because it does not declare itself as satisfied

with the mere form of freedom and infinity, but remains in unalterable and immediate unity with all that is most substantial in the relations of spirit which it of itself endows with living actuality. In such an individuality the substantial is immediately individual, and the individual thereby himself essentially substantive.

(*γγ*) From considerations such as these we conclude that the ideal figures of art must be sought for in the age of mythos, that is to say, speaking generally, in past times, where we shall find the soil most congenial to their growth. If such material is taken from the age we live in, whose most native form, as we actually find it, is tightly shut off from the imagination, it matters not how we regard it, then the modifications which the poet can hardly avoid making in it will not readily escape the appearance of a purely artificial and intentional composition. The Past entirely belongs to memory, and memory perfects the infolding veil of character, events, and actions in the vesture of universality, through which the particular external or contingent detail is unable to penetrate. Many trifling circumstances and mediating conditions, many varied and isolated phases of activity, are inseparable from the actual existence of an action or a character: in the mirror of memory all these insignificant details are obliterated. In this liberation of his work from what is accidental in the external fact the artist has a freer hand for his artistic powers of composition, when dealing with that which is individual and particular in it, if the actions, histories, and characters are borrowed from ancient times. He has, it is true, also historical memories, out of which he must mould a content conformable to the universal; but the picture of the Past possesses, as already observed, an advantage, taken simply as a picture of greater universality, while the manifold texture of mediating condition and circumstance, interwoven as it is in the entire framework of finite existence which surrounds it, offers him material ample enough to prevent his hand obliterating the individuality,

which is essential to his work of art. The more closely we consider it, the clearer will be our conclusion that a heroic age has the advantage over later and more civilized times in that the isolated character and personality generally in such an age does not as yet find what is substantive either in the sphere of ethical custom, or moral obligation opposed to itself in the necessary embodiment of legal institution, and thereby presents immediately to the poet all that the form of the Ideal requires. Shakespeare has, for example, selected much material for his tragedies from chronicles and earlier romances, framed upon a condition of life which has not as yet received the impression of a fully articulated social order, but in which the energy of individuals, as emphasized in personal resolve and achievement, is still the prevailing characteristic. His genuine historical dramas have, on the contrary, a vein of historical substance running through them in the strictest sense, and for this reason lean farther away from an ideal exposition, although here, too, both circumstances and actions are made to fall in with, or are removed to suit, the unyielding self-sufficiency and wilfulness of particular characters. No doubt this characteristic remains for the most part in their case a purely formal self-inclusion, whereas if we contrast it with the self-subsistency of heroic characters we find that here the essential *content* of all such have proposed to accomplish is bound up therewith.

It is on account of this contrast that we should find a reason for repeating the general thesis in connection with the Ideal, to the effect that the *Idyllic* is exceptionally adapted for its expression, inasmuch as where that is presented the cleavage between what is determined by legal necessity and the living person is wholly absent. To this we must reply that, however simple and original idyllic situations may be, however far removed they may be from the artificial prose-existence of society, such simplicity, if we consider the nature of its content, has, in fact, too insignificant an interest to

satisfy the most substantial and essential requirements of the Ideal. Material of this sort fails entirely to include the most weighty motives of heroic character such as Fatherland, moral and family problems, and their development; it is a kind of treatment which is apt to select as the very core of its subject such a fact as the loss of a single sheep or the falling in love of a girl. In this way the Idyllic not unfrequently becomes merely the resource and recreation of our hearts, to which poets such as Gessner, for example, will add their dose of sickly sweetness and sentimentalism. The idyllic aspect of the days we live in have, further, this defect, that this *naïveté*, this domesticated or rural atmosphere in the emotional aspect of love or the enjoyment of a good cup of coffee in the open and things of that sort are not likely to awake much interest, when we find in them nothing but the country parson flavour — find them cut off, that is to say, from all wider relations with the outside world, and not a trace of the profounder web of purposes with which that world is interwoven. It is precisely here that we have reason to admire the genius of Goethe, when he concentrated his poetic talent on material of this kind in his poem of "Hermann and Dorothea." It is true that he selects from the life of the Present a particular theme of very limited extension, but at the same time he unfolds before us as the background and atmosphere of the picture in which his characters are portrayed the great interests of the revolution and his own native country, and, in short, associates with a subject-matter necessarily narrow in its range facts of world-history of the widest and most potent significance.

Generally speaking, we shall find that the ills of life and its evil, war, battles, and revenge, are not excluded from the subject-matter of the Ideal, but are frequently the very source and substance of the heroic age and its myths, whose form grows all the wilder and sterner in proportion to the remoteness of such a period from a fully developed society of law and moral order. In the chivalrous adventures of knight-errantry we find the

heroes of such tales themselves often enough sharing the savage and dissolute characteristics of the times, and in much the same way the martyrdom of the heroes of the Church presupposes a condition of ferocious cruelty around them. At bottom, however, the Christian ideal, which is based on the depth and inwardness of man's spiritual nature, stands in a relation of entire indifference to the external world.

We have demonstrated that the condition of particular centuries is more applicable to the Ideal; in the same way Art selects pre-eminently a particular class of society for the form under which the Ideal shall appear, the order, that is to say, of *princes*. And the selection is made not because art is necessarily aristocratic, or has any predilection for gentility[308], but simply on account of the perfection in which free will and its products may be exemplified imaginatively through the highly placed class. We have in the chorus of ancient tragedy the characteristics and universal background of general maxims, modes of imaginative thought, and emotion, before which the definite movements of the action proceed. In contrast to this appear the more clearly defined individualities of the personages immediately concerned in the action, men and women of authority, and belonging for the most part to royal families. On the other hand, the main impression forced upon us, when seeing representatives of a lower class carrying on pursuits which are of a narrower range, is one of subjection; and, indeed, in an artificial[309] state of society the freedom of action of such a class is fettered in every direction, and is necessarily involved with all its passions and interests in all the medley and despotic forces of external circumstance. It is, in fact, held closely behind the invincible power of the social order, which it is unable to come out of, and is an alien from the authority of the dominant order, even when that is asserted in accordance with just principle. In this limitation of outlook through the hard conditions of life all real independence is wrecked. For this reason both the

circumstances and characters which we find in such a sphere of life are more appropriate to the treatment of comedy, everybody being permitted in comedy to rate themselves as they please, and to lay claims to a self-sufficiency in all that they will and think, which is none the less immediately negatived by the spiritual no less than the external dependence of their lives. As a rule, such a false and second-hand self-subsistency must inevitably fall to pieces when confronted with the actual conditions of life and the distorted view which is formed of them. The force of circumstances is presented to the lower orders of society on a totally different level from that in which it acts upon rulers and princes. In Schiller's "Braut von Messina" Don Caesar is able to exclaim, and justly: "there stands no higher judge than myself!" And when he has to be punished he must himself give judgment and execute it. He is, in fact, subject to no external necessity of right and law, and even when punishment is the question is wholly dependent on himself. The characters in the Shakespearean drama do not entirely belong to the princely order and only partially are taken from mythical sources, but they are placed in the era of civil wars, in which the ties of social order and legislative enactment are either weakened or shattered, and they secure from such a condition the exceptional independence and self-sufficiency we are looking for.

(*b*) If we transfer our attention now from the characteristic conditions of society we have hitherto mainly considered to the actual state of the world around us and its carefully articulated scheme of ethical, judicial, and political institutions, we shall not fail to observe that the material we have here offered us for figures of truly ideal type is of a very restricted character. The province here in which an entirely open field is presented for the display of independent purpose in its fullest individuality is limited both in its range and the measure of opportunity. The qualities that make a man thorough in his relations to his own family and his business, the ideals, in

short, of honest citizens and excellent wives, in so far as will and activity are concentrated on the field in which it is still possible for a man to exercise his free personality, to carry out, in short, all that he has a mind to do, this is the prevailing feature of our modern society. Such ideals inevitably lack the depth of a fuller content, and the most significant feature of them is that of the attitude of the individual mind to their realization; for we find here the content is already presented by existing social institutions, and consequently the essential interest we take in it depends on the particular way in which that content is realized and appears in the *personal life*, its moral and inward significance. For this reason it is not possible, as in the case of former times, to create ideals from the positions of judgeship and kingship. If a man carries out his judicial functions nowadays in accordance with duty and the requirements of his office, he merely is acting within the bounds already marked out for him by legislative enactments in the social order as the sphere of his responsibilities. All that may characterize his tenure of office beyond this, as proceeding from personal qualities, such as suavity of demeanour or acuteness of judgment, is not the main point or the substantial content, but rather an aspect of it which it is possible to dispense with as something accidental. In the same way the monarchs of our own day are no longer, as was the case with the heroes of mythical times, in themselves the embodying and culminating unity of society itself, but rather a more or less unsubstantial *centrum* around which all legal and social institutions, however moulded in the course of time, group themselves in independent relations. All the most important functions of the executive have nowadays been separated from the royal prerogative. Kings do not lay down the law, control finance; the preservation of social order is not one of their most characteristic functions. Peace and war are determined through the particular circumstances of international politics, which it is not within their power exclusively either to direct or control;

and, if it happens that any important decision with regard to either depends in the last resort on their judgment, such a decision is not generally so much in the nature of its substance the result of any personal preference, as it is the formal seal of monarchical authority on what is already determined on public grounds, the mere imposition of that which is strictly official rather than personal in its character. In the same way, a general or field-marshal of our times has unquestionably great authority; objects and interests of profound importance are under his control and his circumspection; his courage, his determination, and his intelligence are involved in the weightiest decisions; nevertheless, whatever may be definitely traced to the essentially personal characteristics of the man has little opportunity for display in such a result. For, in the first place, the objects upon which his decisions turn are not of his own selection, and arise out of circumstances which lie beyond the sphere of his influence rather than are spontaneously fixed by himself; secondly, the means adopted to carry out such objects are not the sole result of his initiative. On the contrary, they are supplied him from sources which are not immediately under his authority or personal influence, but stand rather quite apart from the sphere of his individual powers as a general.

To sum up, then, though it is true that under the present condition of the civilized world a man may act independently for himself in many directions, the fact remains that in whatever direction he may turn he is still only a member of a fixed order of society and appears as such limited in his range rather than the vital representative and individual embodiment of society itself. He acts necessarily under such a condition of restriction, and our interest in such a personality, no less than in the content of his aims and activity, is entirely devoid of completeness. In the end we are invariably driven to concentrate our attention on the purely personal interest, how far, that is to say, he attained success, what was the nature of the obstacles and

complications which, in either, through untoward chance or necessity, confronted or distracted his progress. And if it is, moreover, true that our modern personality is of infinite significance when we estimate the character thus manifested as a spiritual product, in its actions, sufferings, moral opinions, and conduct that is to say, it is also true that the moral content which is realized in such an individual is of a restricted character, rather than, as is the case in the heroic times, the realization of universal right, custom, and legality. The individual is no longer the exclusive vehicle and actual embodiment of these powers as in the previous times.

(*c*) Our interest, however, in and need to have presented us such a completely realized individuality and living self-dependence will always persist, however strongly we may recognize the worth and reasonable nature of the more developed condition of an organized and trained civic society. It is this necessity which makes us regard with astonishment the youthful spirit of Schiller and Goethe when they sought to discover that lost self-sufficiency in the prevailing conditions of modern times. How do we find in particular this attempt is made by Schiller in his earliest works? Simply by a rebellion directed against the whole organic framework of civil society. Karl Moor, suffering injury from the existing order at the hands of those who abuse the power entrusted them, has the courage to break the bonds which bind him to law and order altogether, cuts himself adrift and creates for himself a heroic situation, in which he appears as the champion of right, and the self-constituted avenger of wrong, injustice, and oppression. None the less, how insignificant and isolated must a private revenge of this kind appear, if we estimate it from the practical point of view, according to the probability of its success; and, in fact, in one aspect of it, it already contains the germ of wrong which can only lead to the criminal act on which it will fall to pieces. No doubt, as personal to Karl Moor himself, this is a misfortune, a fatality, however, which, despite the

tragical element in it, can only engraft on mere boys the blight of such a "robber-ideal." In much the same way the characters depicted in "Kabale und Liebe" suffer wrong under prevailing conditions of life, absorbed in the trivial facts and passions wholly personal to themselves. It is not until we come to the dramas of "Fiesco" and "Don Carlos" that we find characters of nobler significance and more substantive content, heroes, for example, resolved to liberate their country, or assert the liberty of religious conviction. With a nobility still more striking Wallenstein places himself at the head of his army that the crisis in the political situation may come to a focus. He is fully cognisant of the nature of the political forces upon which his only means of control, his army, is dependent; consequently he hesitates for long whether to follow his private inclination or his duty. He has barely arrived at a decision when he finds the instrument on which he most depended slip from his grasp; his means of action is gone. For that which in the last instance unites the leading officers and generals is no gratitude for anything that may be due to him on the ground of past services rendered; his fame as a general has nothing to do with it, but rather the duty they owe to the universally recognized seat of government, the oath they have sworn to the head of the State, the emperor of the Austrian monarchy. He finds himself consequently in the end isolated, and is not so much fought with and overcome by an external foe as he is stripped of all means of executing his purpose. He is deserted by his army and from that moment is a lost man. The "Götz"[310] of Goethe starts from a dramatic situation of an analogous though somewhat inverse type. The times of Götz and Franz von Sickingen belong to the interesting epoch in which knight-errantry and the self-reliant individuality of the class of nobility is being superseded by the new creation of an external and legally constituted social order. To have selected precisely this critical time where we find the heroic characteristics of the Middle Ages and the legalized fabric of modern society meet and collide for

the subject of his first artistic production shows much penetration on the part of Goethe. For Götz and Sickingen are still heroes in the genuine sense, who are resolved to exercise their influence over circumstances, whether immediately affecting them or of wider range, out of the resources of their own personalities, their courage, and their private sense of right. The new order of things involves Götz in acts of illegality and brings about the catastrophe of his life. It is only in the Middle Ages that knight-errantry and the relations of feudalism will supply a field entirely open to this type of self-reliant manhood. When we find, moreover, the legalized order co-ordinated more completely in its prosaic form, the predominant authority in fact, the adventurous self-dependence of knighthood is left outside it as an unrelated excrescence; and if an attempt is made to assert it as though it were still a valid means of attacking wrong, and assisting the oppressed, it becomes simply an object of ridicule, such as Cervantes illustrates for us in his "Don Quixote."

In this allusion to the opposition which exists between two differently constituted *régimes* of society and the collision which results from action in defiance of their particular character we have already indicated what we have above defined generally as the closer determination and differentiation of the universal state of the world, that is to say, the *situation* as generally expressed.

2. The Situation

The ideal world-condition which it is the function of art to present in contrast to prosaic reality we may conclude from our previous discussion to be merely a general background of society of a specific kind; it is merely the *possible* condition necessary for the particular presentation, not the presentation itself. What we have hitherto directed attention to is, in fact, the general background upon which the living figures of art may appear. It is undoubtedly fructified with individuality and is supported by its self-

subsistency; but as a *general* condition it is not yet the active movement of particular individuals in the very form of life, just as we may say that the temple which Art erects is not as yet the representation of the personal godhead, but only encloses the germ of the same. For this reason we must in the first instance regard this world-condition as a kind of medium in repose, a harmony, so to speak, of forces which are operative in it, and to this extent it possesses a substantial consistency of uniform worth, which, however, must not be accepted as identical with what has been called "the age of innocence." For it is a condition in the fulness and sovereignty of whose ethical atmosphere the terrors of division only are slumbering because, in our contemplation of it, we have before us, for the first time, the aspect of its substantial unity, and consequently are only presented with individuality in its most universal terms, a mode of viewing it which makes it fade away as though without definition or any essential disturbance of its unity, instead of giving to it the full value of definite characteristics. But such characterization is essential to individuality. And if the Ideal is to appear as *definite form* it is necessary for it to escape from such pure universality, or in other words for it to give the universal a particular expression, and by so doing impart to it both existence and appearance. Art consequently has in this connection not only to translate into its medium a *universal* world-condition, but must proceed beyond this quite indefinite conception to the composition of pictures of *definite* character and action.

Regarded from the aspect under which it affects *individual* character this general condition is the environment of circumstance which, according to its specifically detached form, tends to excite both collisions and development, forcing thereby the individuals thus affected to express their *nature* and exhibit such expression in a definite form. From the point of view of the world-condition this self-revelation of particular individuals appears as the passing of its universality into the distinct embodiments of

living individuality, an aggregate over which *universal forces* still assert the *mastery.*[311] For the eternal powers operative in the world-process constitute the substantive content of the Ideal as specifically defined in what it essentially is. The mode of existence, however, which is realized through the bare form of external condition is unworthy of this content. For in the first place such a condition is associated with habit, and the habitual is no adequate determination of those profounder interests which are active in *self-conscious mind.* Furthermore, as we have observed, it was the *contingency* and *caprice* of individuality, by virtue of whose spontaneous activity these very interests are permitted to appear in life; but this unessential contingency and caprice is again quite as little adequate to the substantive universality, which constitutes the notion of essential actuality. On these grounds respectively we are therefore compelled to seek an art-envisagement more worthy and better defined for the concrete content[312] of the Ideal.

This new configuration the universal powers can only retain in its *determinate existence* in virtue of the fact that they are manifested in their essential modes of difference and movement, or, to put the matter more specifically, through their assertion of the contradictions which they relatively unfold. Two aspects of the process of individualization into which the universal thus passes must be here emphasized. In the first place, there is the *substance* as an embracing sphere of universal forces through the differentiation indicated, which is broken from its substantive unity into its component parts; secondly, there are the *individuals*, which spring forth as the active completion of these forces and give to them a specific objectification.

Now what we have characterized as the difference and opposition in which the world-condition, hitherto harmonious with the individuals conditioned by it, is involved, if we consider it from the point of view of

universal condition, is the manifestation of the *essential content* which it carries in itself. On the other hand we observe that the substantive universal in that condition is articulated through particular units in such a way that this very universal procures for itself determinate existence, albeit it is thus immersed in the appearance of chance, disunion, and division, an appearance, which, however, is rendered nugatory by the fact that it is the universal which thus appears.

The separation of these forces and their objectification[313] in individuals can, however, further take place under definite conditions and circumstances, under which and as a constituent aspect of which the entire objective appearance receives a determinate form, or as the stimulative impulse of this very realization. By themselves such circumstances are without interest[314], and it is only through their relation to mankind that they receive such a significance, through whose self-consciousness the content of these spiritual forces is carried actively into objective appearance. The external circumstances are consequently only to be regarded of significance in so far as they supply an essential relation to Spirit, in so far, that is to say, as they are comprehended by those individual units and afford them a stimulus to actualize their inward *spiritual* needs, the aims, ideas, the determinate substance, in short, of all that requires an individual embodiment. Regarded as a stimulating influence of this kind particular circumstances and conditions create what we have called the *situation*, which is specifically presupposed in the actual self-expansion and activity of all that still lies undeveloped in the universal world-condition; it is for this reason we have considered the previous determination of the notion of the situation as necessary to any inquiry into the true constituents of *action.*

The situation expressed in general terms is in one aspect of it the circumstance *particularized* to the point of *definite character*, and under this characterization it is, to put it another way, the stimulating impulse to a

particular expression of content, which it is the function of artistic presentation to transmute into a specific form of existence. Looked at from this latter point of view especially the situation offers a wide field for contemplation, inasmuch as it has ever been one of the most essential objects of art to discover situations of real interest, that is to say, of such a kind as will present to us the profound and weighty interest, the truest content of spiritual life. The requirements of the several arts in this respect no doubt differ. Sculpture, for example, is pre-eminently limited in its reference to the inwardly detailed variety of situations. Painting and music are already operative in a freer and more comprehensive medium. Finally, we are least able among them all to exhaust the possibilities of poetry in this respect.

Since we have not yet arrived at that portion of our subject where we deal directly with the specific arts, it will be sufficient here to draw attention to a few of the most general aspects of that inquiry, which we may subdivide in the following manner.

First, we would observe that the situation still retains the form of *universality* and thereby of *indeterminacy*, so long as it is undeveloped and without definite characterization; we have, consequently, at first present before us a situation which is without situation. For the form of indeterminacy is itself only *one* form as opposed to its contradiction of determinacy, and is shown to be, by virtue of this very contrast, a one-sided aspect which as such possesses a determinate relation.

Secondly, however, the situation passes in separation away from this universality, and becomes certainly determinate to that extent, but at first with a determinacy which produces no destructive consequences, that is to say, it is one which offers no stimulus to *active opposition* and its necessary resolution.

Thirdly, we find the element of *disunion* in all its vigour creating by the definition of its opposed characteristics the essence of the situation, which thereby is carried into a *collision*, which again proceeds to reactions, and, as such, forms the point of departure to the conception of artistic action properly so called.

We may, in fact, characterize the situation generally as the *intermediate plane* between the universal world-condition still in a state of equilibrium, and the concrete action unfolded in all its tendency to movement and reaction, a position which gives to it the characteristics of both extremes, and enables us to pass over from the one to the other.

(a) The Absence of Situation[315]

We passed from the notion of the universal world-condition in presenting to ourselves the form of it as essentially individual self-subsistency. Self-subsistency, however, regarded simply in its essential form, presents to us in the first instance merely the secure repose upon its own resources in its bare tranquillity. The form as thus defined is carried into no relation with another, but remains at one with itself in inclusion with its unity both, within and without. This presents us with the situation which is without situation, an illustration of which we may take those ancient types of temple-building dating from the earliest days of art, whose character of profound immutable seriousness, of tranquil, nay even of austere and grandiose, dignity has been the object of imitation even in more recent times proceeding on lines of a similar type. The Egyptian and most ancient Greek sculptures will further illustrate for us the same kind of indeterminate situation. In the plastic art of Christianity, especially if we consider particular examples of early bust-sculpture, we shall find both God the Father and Christ are presented in a similar spirit. Indeed, such a mode of delineation is peculiarly adapted to present us with the secure substantiality of the Divine, whether such be apprehended as a definite and particular

Godhead, or is grasped as essentially absolute personality; and this is so in virtue of the very defect of such a representation, that it gives us portraits of persons of middle-age which are without any trace of definite situations, in which the character of the individual as such can reveal itself, and only the attempt is made to express the entirety of determinate character in its quality of stability[316].

(b) The Situation defined in its Harmlessness[317]

The second point to emphasize is, inasmuch as the situation generally is reached in the *definition* of form, the passage from this tranquillity and blessed repose, or from the unbroken severity and force of self-consistency, forms which subsist in unfeatured equilibrium, that is to say, immutable both within and without, have to be set in motion and surrender their undressed simplicity. This bare progression to a more specific manifestation in some particular mode of expression is what we may describe certainly as definite situation, but a situation which has not yet asserted conflicting elements in itself, and is fully ripe for collision.

This first step in the process of individualized expression is consequently of a kind that carries with it no further result; it is set in no antagonistic opposition to something else, in a relation which evokes both collision and reaction; it is already in its character of unconstrainedness finished and complete in itself. With such a type of situation we may associate those which are mainly to be regarded as a kind of play, in so far as all that proceeds or is carried out in them indicates no real seriousness of purpose. For all earnestness in any kind of activity is generally the result of oppositions and contradictions, which drive on their way to the final removal or victory of one side or the other. For this reason situations of this kind cannot themselves be identified with actions, nor are they the stimulative impulse of actions; they are indeed, in a certain aspect, of determinate character, but they are either circumstances of the most trivial

significance, or a form of action which is without an essentially serious object, which either is the result of conflicts, or is able to carry the action yet further into conflicts.

(α) The first thing to arrest us in this process is the passage generally from the repose of the unfeatured situation to a condition of emotion and expression: this is asserted partly as purely mechanical motion, in part also as the first impulse and satisfaction of any internal want. The Egyptians, for example, represented the gods in their sculpture with closely locked limbs. The Greeks, on the contrary, released both arms and legs, and endowed the bodily form with all that is appropriate to the advance and general variety of movement. Permanent repose, a seated attitude, a tranquil gaze, are all of them simple conditions under which the Greeks apprehended their gods; they are modes which unquestionably gave to the self-subsistent figure of Godhead a certain characterization, but one nevertheless which is not carried forward into other relations and oppositions, but rather remains enclosed within itself, and permanently significant as such. Situations of this simple kind attach in a particular way to sculpture, and the ancients, above all others, were inexhaustible in discovering fit subjects for such a condition of unconstrained freedom. In this respect they showed an extraordinary insight; for it is precisely through contrast with the insignificance of the particular situation that the majesty and self-subsistency of the ideal types of the Greek Pantheon were made to appear so striking. It was, in fact, through the harmlessness and insignificance of what appeared to be done or left undone that the blessed peaceful tranquillity and immutability of the immortal gods was brought most clearly to consciousness. The situation merely indicates the particular character of either god or hero in quite a general way, such as brings them into no relation with other gods, or at least into no relation suggestive of hostility or division.

(*β*) It is a further step in the direction of more defined situation, when we find in such any particular purpose already represented in it, an activity which stands in definite relation to something external, and the self-subsistent figure itself expressed as within the sphere of such purpose or activity. Even objectification such as these, however, which have no real disturbing influence upon the tranquillity and cheerful blessedness of the figures represented, are rather to be regarded as particular modes of presentation incidental to this very quality of cheerful contentment. The invention of the Greeks was here, too, exceptionally thoughtful and fruitful. It is essential to the unconstrainedness of such situations that the activity here presented should merely indicate an action in its initial stage in such a way that no further developments or oppositions are likely to proceed from it, but that all that appears necessary to complete it should be found enclosed in the action depicted.

As an illustration of this the situation of the Belvedere Apollo is seized at the moment when he moves forward in wrathful majesty after slaying the Python with his arrow. A situation of this kind has not the grandiose simplicity of the earlier Greek sculpture, which asserts for our intelligence the repose and open clarity of the gods by means of expressed actions of less significance. Take the case of Aphrodite peacefully gazing at herself while emerging from her bath in full possession of her charms; or of fauns and satyrs at play, play that is wholly absorbed in itself; or of that famous satyr who dandled the young Bacchus in his arms, while he looks down upon him with infinite tenderness and grace; to say nothing of the endless variety of unconstrained activities in which Eros is depicted. Such are a few examples of this type of situation. If the action is of more concrete character we are confronted with a more involved situation, which, at least for the artistic presentment of the Greek gods as self-substantive powers, is less appropriate. In a case of this kind the pure universality of the individual god

is less able to transpierce the accumulated detail of the particular action which he expresses. The Mercury of Pigalli, which is a present of Louis XV to the exposition of statuary in Sanssouci, is fastening on his winged sandals. This is a perfectly harmonious action. The Mercury of Thorwaldsen, on the contrary, is depicted under a situation which is almost too complicated for sculpture. He listens attentively to the flute of Marsyas. At the same time he is craftily spying him to see how he may slay him while his hand grasps maliciously for the dagger he has concealed. In opposition to this, if we may add one more illustration from a more modern work of art, is that representation by Rudolf Schadow, of a maiden binding her sandals in much the same simple manner as we find in the case of Mercury. In this example the naïveté of the situation does not contain the interest we experience when it is a god who exhibits such unconstrained action. When it is only a maiden who fastens her sandals or spins, there is little else to engage our attention but the simple action, which is by itself of little significance or importance.

(*γ*) We shall find further, if we follow up the above train of thought, that the more closely defined situation can be treated more generally, as merely a more or less definite stimulus presenting the *opportunity* for further development of expressed action of wider range related to the primary subject with varying degrees of affinity. Many lyrical poems have what we may call an occasional situation of this kind. A particular mood or a certain atmosphere of emotion is a situation which can be arrested poetically for consciousness, and, furthermore, in particular relation to external circumstances, festivals, or public victories, is able to carry us forward to this or that artistic expression, either of more comprehensive or restricted range, and in every kind of embodiment of feeling and idea. Pindar's odes of victory are supreme examples of this type of occasional poetry. Goethe, too, has selected as the subject-matter of his muse many lyrical situations of

a similar character; and, in fact, if we look closely into the matter, we shall hardly be wrong in calling his “Werther” a poem of occasion. It is through the medium of “Werther” that Goethe has elaborated the convulsions and anguish of his own heart, incorporated, in short, the facts of his own experience in a work of art. This, after all, is true of every lyrical poet; he gives poetical expression to that which nearly affects him, and thereby throws the windows of his heart open to the fresh air. That which has hitherto been sealed up within is released in the external object, from which our humanity has freed itself, just as we are the lighter for the rain of tears, in which the sorrow is wept away. So Goethe, as in fact he has told us himself, by his composition of Werther, liberated himself from the mastery and pressure of his heart troubles. At the same time we must point out that this last-mentioned situation is not really appropriate to the type with which we are now dealing; it obviously presents the profoundest contradiction in itself which calls for resolution. No doubt in the kind of lyrical situation we have identified with “the occasional” we may have declared a circumstance objectively determined, in other words, an activity in close relation to the external world; but, on the other hand, we find the poetic temperament equally able to withdraw itself within the atmosphere it creates wholly free from its external environment, and to make that inward world which is the combined product of circumstance and emotion its true point of departure.

(c) The Collision

All the situations to which we have hitherto directed attention are, as already observed, neither true actions in themselves nor indeed the stimulative source of such action. Their determination was to a greater or less degree the purely occasional circumstance or condition, or an action in itself of no significance, in which a substantive content was expressed in such a way that its specific character appeared as a mere harmless play, in which nothing of a truly serious nature was implied. The full seriousness

and weighty import of a situation can only begin when we find in it the element of disruption, where the determination itself exposes an essential aspect of difference, and by its opposition to something else becomes the source of a collision.

The *collision* arises, as we are now considering it, in an act of *violation*, which is unable to retain its character as such, but is compelled to find a new principle of unity; it is a change in the previously existent condition of harmony, a change which is still in process. The collision is, however, not an *action*, and is to be taken simply as stimulus to action to all that characterizes the situation. And this is true, although the contradiction in which the collision is enclosed may be the result of previous action. As an example of this we may cite the trilogies of the ancients, which carry forward the main theme by presenting at the close of one drama the collision which forms the stimulative impulse of the next, which, in its return, renders necessary the resolution which is carried out by the third. And, moreover, for this very reason that the collision always requires some resolution attendant on this conflict of opposing elements, the more a situation is full of it the more it is peculiarly adapted to the subject-matter of dramatic art, it being the especial claim of that art to present beauty in its completest and profoundest development. Sculpture, on the contrary, is not wholly suited to give embodiment to any action, through which the great spiritual forces are manifested either in their division or reconciliation, and indeed the art of painting, despite its more extended spatial significance, is only able to objectify a single moment of action.

These situations of tragic significance introduce a peculiar difficulty in dealing with them which is inherent in their very conception. For inasmuch as they obviously arise from violations of the world-condition they offer to our consideration circumstances which are unable to continue as they are, which render necessary something of a remedial nature to reclothe them.

But the beauty of the Ideal consists precisely in its undisturbed unity, repose, and consummation with itself. The collision, on the other hand, disturbs this harmony of what is truly real and ethical, and drives this unity of the Ideal into discord and opposition. Through the representation of such disruption the Ideal itself suffers violation. The function of art will undoubtedly consist partly in preventing the entire destruction of free beauty in this difference, and partly in only carrying this breach of unity and the conflict it occasions to a point in which harmony may again be recovered as the result of such a conflict and its resolution, and in this way become manifest for the first time in its essential perfection. It is, however, impossible to determine on a general principle the precise limit to which such discordance may be carried inasmuch as the several arts in this respect preserve their independent character. The medium of the subjective idea can support a far intenser disruption than that of the plastic arts[318]. In other words, poetry is quite within its right when it breaks up the unity of the world of the imagination even to the point of the extremest form of desperation, and in its delineation of external objects to that of absolute ugliness. In the case of the plastic arts, on the contrary, in painting, that is to say, and even more so in sculpture, the external form remains in unalterable fixity; it can neither be removed nor lightly passed over in such a way that it again disappears. Under such conditions it would be a serious defect to represent once and for all an ugliness, which could not possibly be transmuted. Consequently all that would be quite compatible in dramatic poetry, which is able to represent a momentary appearance that again vanishes, is not within the province of the plastic arts.

In discussing the more obvious types of collision we can only in this portion of our inquiry indicate the most general points of view. We would particularly draw attention to three fundamental aspects under which they may be co-ordinated.

First, there are those collisions which proceed from purely *natural*, that is to say, physical conditions, in so far as these are characterized with qualities which are negative or evil and consequently discordant.

Secondly, we have collisions which are of a *spiritual* nature, but which depend on *natural* conditions, conditions which may in themselves have a positive[319] character yet for the spirit contain within themselves the seeds of difference and contradiction.

Thirdly, there are divisions which are caused entirely by disruption in the Spirit alone; to these alone we are justified in attaching the peculiar interest of contradiction which is bound up with genuine *human activity*.

(α) Now with reference to the first type of conflicting forces — for the reason that here it is only external Nature, through the maladies and other evils and infirmities which are incidental to her creating, conditions which destroy the pre-existent harmony of life, replacing such with a state of antagonism — such can at most merely serve as a stimulus for something outside them. Regarded wholly by themselves such collisions are of no interest; they are the subject-matter of art simply for the sake of the disruption which may follow as a *consequence* of some natural misfortune. The "Alcestis" of Euripides, we may add, too, that of Gluck, the subject of whose opera is practically the same, are examples of this; in both the sickness of Admetus is necessarily presupposed. That sickness merely by itself could not fitly supply a subject for artistic treatment. It only becomes, even in the handling of Euripides, associated with it by virtue of the individual characters, who, on account of such misfortune, are compelled to face a further collision. It is the word of the oracle that Admetus must die unless another will pass to the underworld for his sake. Alcestis, out of love for her husband, devotes herself to such a sacrifice, resolves to die, in order to restrain Death from touching her beloved, the father of her children, the king. In the Philoctetes of Sophocles a physical malady is also the cause of

the collision. Here the Greeks during their voyage to Troy place the man who is suffering from a wounded foot, caused by the serpent's bite in Chrysas, on the island of Lemnos. In this case, too, the physical mishap is merely the extreme meeting point and incentive of a further collision. For, according to the prophecy, Troy can only fall when the arrows of Hercules are in the hands of the storming army. Philoctetes refuses to give them up because he has been compelled for nine years to suffer the martyrdom of his banishment. This refusal, no less than the fact of his unrighteous desertion from which it springs, could have been followed by every variety of result other than that which took place; the real interest accordingly does not centre in the malady and its physical necessity, but in the opposition which arises from the refusal of Philoctetes to surrender the arrows. The case of the plague in the Greek camp before Troy is very similar; although this is already represented entirely as the consequence of former transgression, as a punishment, in short, a mode of statement more adapted to epic than dramatic poetry, nevertheless it is closely associated with evils incidental to natural misfortune such as storm, shipwreck, and drought. As a rule, however, art will not represent such mischance as mere accident, but rather as an obstruction and misfortune whose necessity simply consists in assuming precisely this particular form rather than another.

(*β*) But, to turn now to our second type of the collision, inasmuch as the external powers of Nature are not that which is most essential to the interests and contradictions of human life, in cases where they are found closely associated with such spiritual relations, they will present themselves merely as the ground from which the collision breaks forth in its true character. This is the point of view from which we must regard all situations, where we trace the original source of conflict in the facts of natural *birth.* We will shortly distinguish between three particular cases of this.

(*αα*) In the first place we have the right that is bound up with natural condition, that which constitutes relationship and inheritance for example, which for the very reason that it stands in close connection with Nature carries with it a number of relations that are bound up with her, and this though the right, the fact is one and only one. The most important example of this is the right of succession to the throne. It is important to observe that this right must not as yet, in relation to the collisions which spring from it, be absolutely fixed by rule, otherwise the resultant conflict will be of quite another character. If, that is to say, the right of succession is not as yet entirely controlled by legislation and the social order which it implies, no wrong will necessarily attach to any one of the alternatives, namely, whether it be an older or younger brother, or any other relative of the royal household who obtains the sovereignty. But inasmuch as sovereignty is a qualitative rather than a quantitative possession, which cannot like gold and other material goods be divided up according to a just principle, dispute and contention is inevitably the result of such a form of succession. When Œdipus, for example, leaves the throne of Thebes without a ruler, he leaves his two sons confronting each other with a right and claim of equal strength. The brothers arrange to occupy the throne alternately from year to year. Eteocles, however, breaks the compact and Polynices brings an army against Thebes to enforce his right. The antagonism of brothers has always been in the history of art a fruitful source of collision; it commences indeed with the story of Cain who slew his brother Abel. In the tale of Shah-Rameh, the earliest example we have of a Persian book of heroic legend, it is a contention of throne succession which is the source of the most varied conflicts. In this Feridu divided the Earth among his three brothers. Selm receives as his portion Rum and Chawer; Turan and Osin are given to Thur, and Fredysh becomes lord of the Earth from Iran. All three, however, claim the land which belongs to his brothers, and endless quarrels and wars are

the result. In the Middle Ages we find just the same countless examples of family and dynastic broils. Such dissensions, however, appear in themselves to be due to accidental circumstance. It is not necessary that brothers should be at enmity; particular circumstances and more important causes must be attached, such as the in itself tragic birth of the sons of Œdipus, or, as we find in "the Bride of Messina," the author is at pains to shift the quarrel of the brothers on to still more fateful circumstances. In Shakespeare's "Macbeth" a similar collision is the foundation of the tragic dénouement. Duncan is king and Macbeth, as his nearest and oldest relation, is consequently heir to the throne with a right precedent even to Duncan's sons. The primary incentive of Macbeth's crime is the wrong which the king has done him in naming his own son as heir to the throne. This justification of Macbeth, which is supported by the chronicles of the time, Shakespeare has entirely passed over, because, it was solely his object to bring into startling relief the repulsive aspect of Macbeth's ambitious passion, in order thereby to make his work agreeable to King James, who would be naturally interested in finding the crime of Macbeth depicted without extenuating circumstances. As a consequence we can find no sufficient reason why, under Shakespeare's handling of the subject, Macbeth fails to murder the sons of Duncan no less than their father, lets them escape in fact; nor can we understand why they are wholly overlooked by the nobles. However, the entire collision upon which, the drama of Macbeth turns carries us beyond the particular type which we are now mainly considering.

(*ββ*) In the *second* of our examples in the type of collision[320] we are now discussing we find the reverse situation to that just discussed, and it consists in this that difference of birth, which carries within itself a *wrongs* is moreover, through ethical *custom* or *law*, held within the chains of an insuperable *barrier*, so that it receives at the same time the appearance of an

innate wrong, and consequently is the cause of collisions. Slavery, serfdom, differences of caste, the position of Jews in many states and, with certain qualifications, even the contrast between an aristocratical and citizen class are all of them cases for consideration under this head. The conflict here consists in this, that on the one hand humanity has rights, relations, desires, aims and requirements which belong to it essentially in virtue of its fundamental idea, which nevertheless in each one of the above mentioned examples meet with dangerous restriction and obstruction owing to the compulsive necessity of natural birth. On this type of collision we have the following remarks to offer.

The differences which obtain between classes, such as the ruled and the rulers, are, no doubt, essential to the notion of state-life, and are founded on reason, for they are caused by the inevitable articulation of the organic community, and assert themselves as such through the specific forms of occupation, disposition, modes of life, and general levels of education in all their branches. It is another matter, however, when these differences as they affect individuals are determined absolutely by the accident of birth, so that the individual man from the very start is not on account of any quality in himself, but solely through the accident of Nature, irrevocably relegated to a particular class or caste. In such a case it is obvious these differences appear as innate and are, moreover, though purely external, girt with force in its highest and most aggressive mode. We are not bound to ask ourselves how this fixity and compulsive restraint came originally into existence. For the nation may originally have been united, and the natural distinction between freeman and serf been only evolved at a later time, or the difference between castes, classes, and privileged persons may have grown out of earlier distinctions of nations and races, as many are inclined to think is the explanation of the caste distinctions of India. All this is a matter of no moment to us here. The main point simply consists in this, that vital

relations of this kind, which regulate the entire course of human existence, have their source in natural conditions. On general principles, no doubt, distinctions of class can be justified, but at the same time no individual should be wholly robbed of his right to determine as his choice may direct to which particular class he shall belong. Natural capacity, talents, adaptability, and education are the only right means to direct the way and decide in this respect. When, however, the right of choice is debarred from birth onwards and a man is made thereby dependent on Nature and its contingency, there is always the possibility of conflict within the sphere of this necessity between the states thus enforced on the individual by natural conditions and the measure of spiritual education which he may acquire and the higher demand which it may justly make. This is a pathetic and unfortunate type of collision which has its source in an essential *wrong* which the freedom of art is quite unable to respect. In the social condition of our own days distinctions of class, with a few exceptions, are not determined by birth. The ruling dynasty and the peerage are the only exceptions, and these depend on a higher conception of the State altogether. For the rest, the mere fact of birth creates no essential distinction that can ultimately determine the class to which a man may belong if he is otherwise competent to join it. For this reason, however, we must condition the demand for entire liberty of choice with the requirement that in education, knowledge, ability, and general tastes the individual is equal to the particular society with which he may desire to associate. If, on the contrary, the fact of a man's birth presents an insuperable obstacle to such claims, which he would otherwise be quite competent to satisfy by virtue of his own vigorous activity, then such a situation must appear to us not merely a misfortune, but essentially a wrong under which he is compelled to suffer injury. He is thus separated by a purely natural partition wall which is essentially unjust, that is to say, one beyond which his talents, sentiments,

and general education have already raised him, from that which he was competent to reach, and a purely natural condition whose legalized fixity has been determined wholly by caprice presumes to oppose insuperable barriers to the freedom rightly demanded by all spiritual life.

To examine more closely the nature of this type of collision we shall do well to look at it from three different points of view, each of which are of essential importance.

In the *first* place, it is necessary that the individual should, in the strength of his own spiritual resources, already really have passed beyond the natural barriers whose opposition is to give way before his aims and desires, otherwise the demand is simply an act of folly. If, for example, a domestic servant, whose education and ability is merely that of a menial, falls in love with a princess or a lady of high society, or, inversely, either of these with him, such a love affair is both absurd and devoid of all taste, and this is so even if the artistic representation of this passion display all the depth and interest of which an ardent heart is capable. In such a case it is not so much the difference of birth which creates the obstacle; this is rather to be found in the entire content of interests, education, aims of life, requirements, and mode of sentiment which distinguish in status, material resources, and social qualifications a lady in high position from a domestic servant. If love is, as in the case assumed, the one and only bond of a union, and is associated with nothing else throughout the entire sphere of all that men and women have to live through in just accordance with that which a particular status requires from their intelligence and experience, it must necessarily remain devoid of content and is simply a union of the senses. Love, to be wholly complete, is nothing less than a real harmony of the entire conscious life, in which the full nobility of sentiment can be shared and appreciated.

The *second* case we wish to examine is that in which the dependence of birth surrounds an essentially free human life and the objects it may rightly

set before itself with legalized fetters of obstruction. This collision also presents an element unadapted for artistic treatment, opposed, that is to say, to the notion of the Ideal, despite its love to make use of it and the facility with which it may attempt to do so. If distinctions of birth through positive laws and the powers which support them create a persistent wrong, as doubtless may be the case where a man is born an outcast or a Jew, he obviously, from one point of view, is entirely right in holding with all the strength of his inward life, which rebels before such a barrier, that the same is dissolvable, that he, in fact, recognizes his individuality as apart from it. To oppose such restraint appears to be wholly justifiable. But in so far as it becomes impossible through the force of existing circumstances to overcome such a barrier, which is consequently converted into an irrevocable necessity, a situation of this kind can only be regarded as a misfortune which itself is not without an element of falsity. For the rational man is inevitably forced, in so far as he is unable to subjugate the opposing necessity, to submit to the same: it is not in reason to continue to fight against the inevitable, but rather quietly to let it pass over him. He must, in fact, abandon the sense of interest in and need of that which is, by virtue of this barrier, swept from his reach, and suffer what he fails to overcome with the quiet courage of passive endurance. Where a struggle is of no avail it is the part of wisdom to be quit of it in order at the least to retire into the *formal* independence of personal liberty. By doing so the forces of wrong have no longer power over him; if, on the contrary, he battles against them he must necessarily experience his dependence in its fullest extent. At the same time it remains unquestionable that neither this abstraction of formal independence any more than that content which can lead to no result are truly beautiful when artistically considered.

There is a *third* type of collision which, while being immediately connected with that we have just considered, is equally removed from the

genuine Ideal. It is to be found affecting that class of persons who attempt to assert some privilege which the mere fact of birth concedes them and supports with the full weight of a religious title, positive enactments, and the prevailing conditions of society. In such a case, it is true, we have an independent position in harmonious relation with what is externally realized in positive institutions, but when considered as the mere consistency of that which is in itself unjust and irrational it is quite as much as in our former example a purely formal independence, and the notion of the Ideal disappears. We may, no doubt, very possibly persuade ourselves that the Ideal is retained because we have here an appearance as though the personal life is in full union with the universal and its legalized constitution, remaining consistently in such unity; but it will be observed that here the universal does not assert its dominating power in the *particular person*, as we found the heroic Ideal demanded, but only in and through the public authority of positive laws and their administration; moreover, what the individual here asserts is assumed to be essentially wrong, and he loses in consequence the substantive significance which we have seen to be also essential to the Ideal. An affair in which the ideal subject of art is concerned must itself be at bottom true and justifiable. To this type belong the legalized lordship exercised over slaves or serfs, the right to rob a foreigner of his liberty, or to sacrifice the same to the gods. No doubt it is quite possible that such a right may be sustained by individuals with unquestioning belief that they are justified in so doing, as in India, for example, the higher castes make use of their privileges, or as Thoas ordered the sacrifice of Orestes, or in Russia the lords are wont to flout their serfs. In fact, those who are in authority are very likely to execute such rights as legalized rights on account of the interest they may have in preserving them. But in a case of this kind their right will be merely the unrighteous right of the barbarian, and they must themselves appear to us in the category

of barbarians, at least, who resolve to carry out and perfect what is essentially injustice. The legalized form, under which the individual shelters himself, is, for the time to which it belongs, and its spirit and the educational standard adapted to it, no doubt to be respected and justified. But if we reflect upon it rationally and apart from that, it is wholly positive[321], containing no intrinsic claims or authority. Moreover, if the individual makes use of his privileges for purely personal objects, under the mastery of particular passions and the aims of mere selfishness, in addition to our barbarian we get a bad character to boot.

Poets have frequently sought to arouse our pity, and it may be our fear as well, through the presentation of conflicts of this kind, following the rule of Aristotle, who lays it down that fear and compassion are objects of tragedy. Strictly speaking we experience neither fear nor reverence when confronted with rights which only exist among barbarians and are the misfortune of uncivilized times. Any compassion which such situations are likely to arouse is almost immediately converted into a spirit of indignant hostility. The only true artistic *dénouement* of such a conflict is one where we find such illegitimate rights are not carried into execution, as, for example, neither Iphigenia nor Orestes are respectively sacrificed in Aulis and Tauris.

(*γγ*) The *third* and last class of that type of collision which is based on purely natural condition is that which is duetto personal passion caused by natural peculiarities of temperament and character. The jealousy of Othello is a supreme example of this. Ambition, avarice, nay, even love itself in certain aspects, will furnish other illustrations. Collision of this kind is only properly referred to such passions in so far as individuals, seized and dominated exclusively by the power of such emotions, are thereby forced into antagonism with the truly ethical constitution and inherently justifiable course of human existence, and consequently are plunged into a still more serious conflict.

This carries our inquiry into the consideration of that third subdivision of our original classification of general types of collision, the type of which is based exclusively upon the conflict of spiritual forces, in so far as such opposition is the result of human activity.

(*γ*) We have already observed when dealing with purely natural collisions that they only form the starting-point as it were for further states of contradiction. And the same is more or less true of the second type of conflict already adverted to. All these, in artistic compositions of really profound significance, are unable to remain in such forms of opposition as we have hitherto discussed. Such disturbances and conflicting elements merely substantiate the opportune moment, out of which the true and essential forces of spiritual life will clash together in opposition and contend for the mastery. That which is spiritual can only be set in activity by virtue of spirit. Consequently the oppositions of Spirit can only win reality in actual human deed, can only thus manifest themselves in their true character.

The position we have arrived at, then, is this. We have on one hand a difficulty, an obstacle, a violation effected through something human life has carried out in action. We have on the other a violation of interests and forces intrinsically just and right. By treating these two forms of determination in close juxtaposition we, for the first time, are able to gauge the full depth of this last type of collision.

We may distinguish between the prominent examples which fall within the consideration of this class of cases as follows:

(*αα*) In passing from the sphere of that type of conflict which we have pointed out rests for its primary basis on what is entirely due to Nature we observe that the first class of cases which confronts us on crossing the boundary to the consideration of a new type is closely related to that we

have just left behind us. If, then, human action is assumed to be responsible for the collision, it will follow that what is carried out as natural through human action, that is to say, in so far as humanity is not entirely *spiritual*, will consist in this that a particular action is performed *unconsciously* and without purpose, which will be found afterwards to be a positive infraction of the forces of self-respecting and civilized society. The consciousness which any man latterly acquires of the injurious nature of an action, of which he was previously unaware, will drive him who still accepts the responsibility of such an action into division and conflict. The ground of such a conflict, in fact, consists in the opposition with which the mind is confronted between that which was actually before it *when the action took place*, and the subsequent discovery of all that was really *implied* in the act itself. The cases of Œdipus and Ajax will at once suggest themselves as examples. The action of Œdipus, if viewed simply with reference to his will and knowledge, amounted merely to the fact that he killed a perfect stranger in a quarrel. The unconscious act was the reality in its full significance, that is to say, the murder of his own father. Ajax, in a fit of frenzy, slaughtered the cattle of the Greeks believing them to be the Greek chieftains. On regaining his senses and discovering what he really did he is seized with a sense of shame which drives him into collision with himself. We must, however, observe that what has been unconsciously violated by a man in the type of collision we are now examining ought to be something which he himself, when fully in a position to judge, would both honour and revere. If such a reverential attitude has its roots merely in personal idiosyncrasy or superstition, such a collision can arouse, to say the least, no really profound interest.

(*ββ*) Further, inasmuch as in the cases we are now discussing the conflict arises from a *spiritual* violation of spiritual forces through human action, the collision more generally appropriate to the type will consist in a

violation which is perpetrated with full consciousness *proceeding out of such* and the intention it implies. The point of departure here may centre again in passion, violence, folly, and other similar qualities. The Trojan war, for example, originates in the rape of Helen. Agamemnon afterwards sacrifices Iphigenia, and so violates the feelings of her mother, slaying thus the darling of her womb. Clytemnestra, in consequence, murders her spouse. Orestes avenges the murder of his father and king by assassinating his mother. In a similar way in "Hamlet" the father is sent to his grave by a stratagem, and the mother of Hamlet insults the *manes* of the dead man by a precipitate marriage with his murderer.

In the case of these collisions as in those already considered, the main point is this, that humanity is engaged in a self-imposed conflict with what is intrinsically moral, true, and worthy of reverence. If this is not so, then, for all who are really conscious of what is moral and right, such a conflict can only appear without worth or material significance, as is the case, for example, in the famous episode of the Mahâ-Bhârata, with reference to Nalas and Damayanti. King Nalas marries the princess Damayanti, who is allowed the privilege of making a free choice among her sisters. All the other suitors are genii floating in the air; Nalas stands on the Earth alone as a man, and she has the good sense to select him. The genii are consequently much enraged, and watch for the moment when they may find King Nalas tripping. For many years they can bring to his charge no offence, as he is capable of none. At last, however, they obtain power over him, for he commits a great crime; the crime is this, namely, that after making water, he treads with his foot upon the earth thus watered. According to Indian ideas this is a severe offence which cannot escape punishment. From that moment the genii have him in their power; one renders all his amatory desires abortive, another excites his brother against him, and finally poor Nalas, after forfeiting his throne and being reduced to beggary, is driven forth a

wanderer in wretchedness with Damayanti. At length he is even compelled to part with her, until, as the tale will have it, after many adventures, he is once more set on the throne of his original happiness. The real conflict upon which for the Indians of old days the whole of this story was supported was an essential desecration of a sacred thing: according to our notions the tale is absurd from beginning to end.

(*γγ*) Thirdly, it is not necessary that the disruption should be direct, or, in other words, that the action taken solely by itself should be an act of collision; the fact of collision may well appear out of relations and circumstances of opposition and antagonism which are forced upon the mind during the process of that action's execution. Juliet and Romeo are in love with one another. In the mere fact of their love there is nothing to suggest disunion. But they are aware that their families are living in mutual hate and hostility, that their parents will never consent to the marriage, and they are carried into collision by virtue of this preassumed situation of antagonistic forces.

We must content ourselves here with these very general remarks upon the relation which the determinate situation occupies in its opposition to the universal world-condition. Were we to extend our inquiry into all the divergent aspects, modifications, and nuances of the subject, attempting thereby to express an opinion upon every possible form of situation, this chapter would alone present us with sufficient matter for discussions of endless prolixity and diffuseness. The discovery of different situations implies a content of exhaustless possibilities; and in every particular example the essential question involved is how such may be adapted to the treatment of any specific art, in true subordination to the principles and character of such an art. To the fairy story much is permitted which is forbidden to a more stringent mode of artistic representation. And we may say that generally the discovery[322] of the situation is a critical point in the

process of art-production which often presents great difficulty to artists. In our own days the difficulty of obtaining a suitable subject-matter as a source for the circumstances and situations which the artist requires is a common complaint. At first sight it may appear to us more in keeping with our notion of poet if he borrow from his own resources, and invent situations himself; but such independence does little to increase his claims as a creative artist. For the situation does not directly constitute the spirituality of his work nor indeed give us its true artistic form: all that it does is to supply the external material in which as its appropriate medium a character or temperament is unfolded before us. It is only after working into this external material in which actions and characters find their starting-point that the true genius of the artist is actively displayed. The poet consequently has little or no claim to our thanks for merely having himself invented this least of all poetical aspects of his production. He is, in fact, fully entitled to draw as much and as frequently as he pleases from anything that comes to his hand, whether it be history, saga, mythos, or chronicle, nay, even from material and situations which have already been artistically treated. Just as we find in the art of painting the external matter of the situation is borrowed from legends of saints, and the process has been repeated on similar lines over and over again. To discover the real artistic significance of such artistic work we must penetrate far beyond the mere invention of particular situations. The same remarks will apply in full force to the entire wealth of the circumstances and developments artistically handled. In reference to this it is frequently claimed as a virtue of modern art in contrast with that of the ancients that we find in it an infinitely more exuberant imagination. As a matter of fact, we do find in the artistic creations of the Middle Ages and our modern world the most extraordinary variety and interfusion of situations, events, and occurrences, whether tragic or otherwise. This fulness of detail, however, does not take us far. In spite

of it all we have very few dramas or epics of the first excellence. For the main point is not the external course and interchange of a variety of events, when we find such events and histories merely complete the entire content of our work of art; rather it is the ethical and spiritual form which embodies them, and the masterful movements of temperament and character which are exposed and unveiled during the entire process of this artistic embodiment.

Glancing now at the main position we have arrived at, and from which our inquiry will proceed, we have found that circumstances, conditions, and relations, whether determined with a reference to the external world or the subjective consciousness, only create the situation by virtue of the *temperament* or passion which experiences them and derives its nutriment through them. We have further seen that the situation breaks up this determinate form in opposition, obstruction, development, and disruption, so that the *emotional* life feels itself compelled by the force of the affecting circumstances to *react with energy against* this disturbing and restraining influence, which stands in the way of its objects and passions. It is here, in truth, that the action, strictly speaking, commences, when, that is to say, the contradiction has fully asserted itself, which was already implied in the fully defined situation. Inasmuch as, however, the action which is based on this collision disturbs the unity of that which is opposed to it, it calls into being by its antagonism the opposing force of that which it confronts, and consequently the *action* is immediately associated with the *reaction.* With this analysis of the forces rendered necessary by dramatic action, we have at length arrived at the notion of the Ideal as a fully defined process. For we are here presented with two distinct spheres of interest, both of which have been rent, as it were, from the harmony they originally possessed, and confront each other in conflict. Such, by the contradiction which is involved in them, make a *resolution* of the discord necessary. This movement,

regarded as a homogeneous whole, belongs no more to the province of the mere situation and its conflicts; we are carried now into that portion of our inquiry to which we have already given the name of the genuine action.

3. The Action

In the development of the subject under consideration, the *action* immediately follows after the universal *world-condition* and the particular *situation.* In considering the action in its external relation to that portion of our inquiry we have just concluded it will be well to bear in mind the result we arrived at, that it presupposes circumstances which necessitate collisions, action, and reaction. It is impossible to determine at what point in the circumstances thus presupposed the action will *begin.* For that which in one aspect will appear as commencement will very possibly present itself in another as the result of earlier developments, and to that extent will postpone the real starting-point. And in like manner this, too, we may regard as a fact resulting from former collisions. To take an example; in the house of Agamemnon Iphigenia in Tauris expiates the guilt and misfortune of her family. The commencement here of this deliverance on the part of Iphigenia is the fact that Diana carries her to Tauris. This circumstance is, however, merely the result of earlier stages of the story, such as the sacrifice in Aulis, which is again conditioned by the injury done to Menelaus in the rape of Helen by Paris, and so on, ever backward, until we come to the famous egg of Leda. In the same way the events which are the subject-matter of the Iphigenia in Tauris presuppose the murder of Agamemnon, and all the crimes associated with the house of Tantalus. An analysis of much the same character might be applied to the Theban circle of mythos. If an action is to be represented with all the facts that condition it, poetry is the only real art that can attempt this. Such a complete exposition of historical fact has already become, as a certain proverb reminds us, rather a

wearisome business; it is, in fact, more within the province of simple prose, and, in contrast with such completeness, poetry will rather consider its true function to be that of taking its audience at once into the heart of the matter. There is a further important reason why it should not be to the interest of art to make its commencement from that point where we find the action under consideration is in the first instance externally conditioned, and it is this: such a point of departure is, after all, only related to the process regarded as natural or historical fact[323]. The association of the action with this commencement merely concerns the empirical unity of its appearance; it may, however, in itself be of no significance at all to the real content of the action. This external unity of historical sequence remains just as it was, however it may chance that one particular person is affected by the involved threads of a varying series of fact. No doubt the entirety of the facts of life, its actions and fatalities, tends to make the individual what he is; but for all that his true nature, the real core of his thoughts and capacities, is manifested in *one* great situation and action independently of them. It is the progress of these which reveals to us really what a character is made of, a character which previously to their occurrence had been known merely in a nominal way, that is the name of one more fact among the external facts of experience.

We must therefore not look for the commencement of the action in that *empirical* source of it; we must rather centre the attention upon those circumstances which have taken a hold upon the particular nature with which we are dealing, and created or satisfied its needs; we must, in fact, reveal the particular collision in whose conflict and resolution the action in question consists. Homer, for example, in the “Iliad,” makes a start at once with the particular fact on which his entire epic is founded, that is to say, with the wrath of Achilles. He tells us nothing of earlier history of the life of Achilles, but emphasizes at once the critical collision, and, moreover,

does it in a way which unfolds a background of the greatest interest to his picture.

The representation, then, of the action as a process complete in itself, in which action, reaction, and resolution are constituent elements, is, above all, the function of the poetic art; all the other arts can at most only seize upon and secure in their presentation one moment of this process. It is quite true that if we direct our attention to that aspect of the medium they employ which is richest, they may appear to have an advantage over poetry; in painting especially[324] we find a control asserted not merely over the entire external form, but also over the expression of external demeanour and the play of such relatively to other objects grouped around it. Such a means of expression, however, cannot compare as an interpreter of truth with human speech. The action itself is the clearest means of unfolding to us individual character, whether we view it relatively to the entire emotional life[325] or the objects of mind. All that a man is at the very root of his nature is first revealed to us through his acts; and action, for the reason that it is an expression of spirit, finds its ultimate expression as such most clearly and concisely in speech alone. When we speak in general terms of human action we are apt to figure to ourselves an incalculable variety of mode. For Art, however, the sphere of action suitable to artistic representation is, generally speaking, limited. Her province is wholly restricted to the type of action which is conformable to the necessary configuration of the Idea.

There are three points of essential importance necessary to grasp in connection with such action as is capable of artistic representation, and which we may emphasize as follows. The situation and the resulting conflict is that which generally stimulates it; the active movement, however, taken by itself, the element of difference, that is to say, of the Ideal in its activity, is made apparent first by virtue of the reaction. This movement may be resolved into the following component features:

First, we have the *universal*[326] *forces*, which constitute the essential content and object, for the sake of which the action takes place.

Secondly, we have the *realization*[327] of these forces in the *individuals* who act.

Thirdly, the two aspects above mentioned have to unite themselves in that which, in default of any better generic term, we will here call *character.*

(a) The Universal Forces of Action

(*a*) However much we have finally arrived in our consideration of the action at a point where the definition and differentiation of the Ideal is of the first importance, nevertheless the very notion of art renders it necessary that in the sphere of true beauty, be the aspect of it whatsoever it may, it must still have upon it the stamp of the Ideal; it cannot, that is to say, maintain itself without rationality and the justification it implies. Interests of an ideal character must inevitably be in conflict with another, so that might is opposed to might. These interests are, in fact, the eternal and universal forces of spiritual existence, the essential cravings of the human heart, the spontaneous and inevitable objects of human action, justifiable and rational in virtue of their own character, and consequently the very universal powers to which we have referred. They are indeed not the absolute Divine itself, but rather the sons of the one absolute Idea[328], and consequently dominant and valid. They are the children of the one universal truth, albeit only determinate, particular moments of the same. Through their very distinction, it is true, they can fall into contradiction or disunion, yet despite all the element of difference contained, they must possess the original essentiality within them in order to appear as the determinate Ideal. Such are the supreme motive forces of art. They are the eternal[329] religious and ethical modes of relationship, status, personal character[330], and in the world of romance, before everything else, honour and love. In the particular

grade of their significance these powers differ, but all are essentially the product of reason. At the same time it is these powers in the human heart and mind, which man, by virtue of his humanity, is bound to recognize, to give free play to, and to actualize. At the same time they ought not directly to appear as rights in positive legislation. For, to take one reason, the form of positive legislation, as we have seen, is already in partial conflict with the notion and content of the Ideal; furthermore, it is quite possible that the content of positive rights may contribute to that which is essentially unjust, albeit entirely clothed in the attributes of law. The relations we have above referred to, however, are not merely the supreme stable embodiment of the external world[331], but the essentially substantive powers, which for the very reason that they contain in themselves the actual content of human existence, continue to be the stimulating source of its activity, and ultimately all that ever carried it forward to perfection.

Of this kind are the interests and objects which contend against each other in the "Antigone" of Sophocles. Creon, the king, as ruler of the state, by a decree couched in the severest terms, forbade the right of burial to the son of Œdipus, who had proved himself an enemy of his country by bringing an army against Thebes. This proclamation was so far justifiable that it expressed care for the weal of the entire city. Antigone, however, is animated by an ethical principle of equal authority, in other words by her love for her brother, whom she finds it impossible to leave unburied, the prey of carrion birds. To leave such a duty unfulfilled would be in direct opposition to the sacred instincts of her personal relationship. She consequently violates the decree of Creon.

(β) Collisions of the type with which we are now dealing may be introduced in every possible way; the necessity of the reaction, however, must not be occasioned by means of anything out of place or at cross purposes[332] with the main action, but through that which is in itself

reasonable and justifiable. For example, in the well-known German poem of Hartmann von der Aue, "The Poor Henry," the collision is repulsive. The hero in this poem is visited by a fatality, that is to say, an incurable disease. He turns for assistance to the monks of Salermo. They state as the condition of his cure that a human being must willingly surrender his or her life, on the ground that the necessary salve can alone be forthcoming from a human heart. A poor maiden who is in love with the knight offers freely her own life and accompanies him into Italy. This is pure barbarism, and the silent love and pathetic devotion of the maiden are unable, consequently, to produce their full effect. It is true that we find the injustice of human sacrifice presented us by the ancients as the ground of the collision. The famous example is that of the story of Iphigenia, who is first offered as such a sacrifice, and afterwards is on the point of offering up her brother. But, in the first place, it is to be observed that in these examples the conflict is in close connection with other relations which are in themselves justifiable; secondly, the artistic principle is really satisfied, as we have already observed, by the fact that both Iphigenia and Orestes are finally delivered, and the power of a collision which is opposed to our notion of right is thus destroyed. And, indeed, this is also the case in the above mentioned poem of Hartmann, in so far as we may acknowledge the *dénouement* offered us in which, on Henry refusing to accept the sacrifice, God releases him from his malady, and the maiden is rewarded for her true love[333].

In apparent association with the positive powers we have enumerated must be added others set over against them, that is to say, the forces of that which is negative and bad, evil in short. That which is purely negative, however, ought not to be taken in the ideal representation of an action as the essential ground-motive for the necessary reaction. The reality of the purely negative case, it is true, corresponds to the negative and its appropriate character, but, if the implied[334] notion and object is already in itself rendered

nugatory, it is even less possible that the ugliness which is exposed in the inward life should manifest any genuine beauty upon its external reality. The sophistry of passion can, indeed, by means of the capacity, strength, and energy of a character, make the attempt to graft positive characteristics upon the negative, but we only obtain thereby the vision of a whitewashed grave. For that which is purely negative is generally flat and stale and leaves us consequently either void or drives us back, whether it be used as the motive force of an action or merely as a means to promote a reaction in another. The horrible, unfortunate, the harshness of dominion, and the obduracy of superior power may form part of the content and burden of the imagination when such characteristics are exalted and carried by the abundant greatness of a particular character or object. Evil, however, taken simply for what it is, envy, cowardice, and meanness, is merely repulsive. The devil, if we take him for what he really ought to be, is consequently a bad subject, or rather a figure for which Art has no uses at all. He is just a falsehood and nothing more, and consequently an extremely prosaic personality. In the same way it is perfectly true that the Furies of hate and many other allegorical figures of later times are potencies of a kind, but they are without affirmative subsistency and holdfastness[335], unfavourable to ideal representation, although in this respect a wide margin of difference is permissible in the several arts respectively, and in the particular mode in which they may immediately visualize such objects. Evil is, to express it in most general terms, essentially cold and devoid of content, because as such it is merely the source of negation, discord, and misfortune. All art, however, which is true to its essential notion, should reflect on us the vision of a harmony. Meanness, above all, is despicable, for it is a quality which arises from the envy and hatred of all that is noble, and does not shrink from distorting even a power that is essentially based upon the good into a means conformable to its own perverse and shameless passion. The great poets and

artists of the classical world have in consequence never presented us with the vision of absolute evil and depravity. Shakespeare, on the contrary, in his tragedy of "King Lear," unfolds before us the spectacle of wickedness in all its horrors. The old Lear divides his kingdom among his daughters, and, while doing so, is foolish enough to believe in their false and flattering speeches, and to misinterpret the silent and faithful Cordelia. There is already folly and madness in this, and it is followed by the most outrageous ingratitude and worthlessness of the elder daughters and their husbands to the point of absolute craze. As an antithesis of this the heroes of the French school of tragedy are stretched and puffed out with every sort of grandiose and sublime motive, and make a great parade of their honour and nobility, and yet despite of it all destroy the very meaning of such motives by the mere fact of what they really are and accomplish. But it is in modern times more especially that we find this unstable dissolution of everything spiritual[336], which forces its way through every dissonance, however repulsive, become quite *à la mode*; moreover, it has even given us what we may describe as the humour of the abominable thing, a kind of burlesque simulation of irony, an atmosphere in which a Theodor Hoffmann, for example, has found himself so much at home.

(*γ*) We may conclude, then, that it is the essentially positive and substantive powers in the spiritual world which supply the real content of the ideal action. These sources of energy, however, in their artistic embodiment, must not appear in their inherent universality, albeit within the reality of the action they are essential phases of the Idea. Rather they must receive the form of independent individuals. If this were not so they would remain as merely the universals of thought or abstract conceptions which do not properly fall within the province of art. Though in their origin they should be held as intact as it is possible to hold them from mere caprices of the fancy, it is equally necessary that in their development they should

acquire determinacy no less than self-consistency[337], and in this way appear as essentially particularized. Such definition as they possess ought not to be carried to the point of the particularity of external objects, nor should their concentration be carried to that of the subjective self-consciousness[338]. Otherwise the individuality of those universal powers is necessarily involved in all the developments of finite existence. In this respect we may say, then, that the determinacy of their individuality is not to be taken too seriously. The gods of the Greek Pantheon are the most conspicuous example of this manifestation and sway of the universal forces we have just discussed in their self-subsistent form. However they may be brought before us, their blessedness and cheerfulness remains unaffected. Regarded separately as particular gods no doubt they engage in conflict, but in all their battles we shall ultimately find they are not really serious in the sense that they concentrate themselves on any definite object with the entire consequential energy of their character and passion, fully prepared to stake their existence upon the result. They engage in this affair or that wherever it may take place, identify particular interests in concrete examples with their own; they are, however, equally ready to leave the matter at any point and wing their way back happily to Olympus. Such is the view we get of the gods when they engage in warfare on the pages of Homer. The determinacy of their characterization is capable of conflict, but they remain for all that the purely universal determinations which at bottom they are. A battle begins to rage; heroes advance singly one against another; then we lose sight of individuals altogether in the universal storm and crush; it is no longer the specific qualities of individuals which are now set in relief against each other — it is the universal rush of the fight, the daemon of war loosed and roaring, and now it is that the universal powers, the gods themselves, step forth on the scene of battle. From such a temporary display of the contrasts of their characterization they ever withdraw themselves into

the solitude of their self-subsistency and repose. For though the individuality of their form carries them perforce into the region of time and contingency, nevertheless inasmuch as the universal they claim as gods is that which ultimately must prevail, the individual characteristic shrinks away into the determination of external form only; they are unable in their personality to penetrate the true arcana of conscious spirit[339].

Their physical definition is, in fact, either more or less only the accommodating form of their divinity. But this self-subsistency and careless repose is precisely that which gives to them their plastic individuality, and relieves them of any anxiety and constraint[340] in relation to earthly objects and events[341]. For this reason we find in the gods of Homer no final result when actively occupied with the concrete facts of human life, although such activity is displayed for us in many and diverse directions. The material and interest of human events which happen in time is that which gives them something to do and nothing more. And in like manner we may remark other peculiar characteristics attached to the Greek gods, which we can only regard as essentially unrelated to the general notion of divinity which each god respectively connotes. Mercury is, for example, the slayer of Argus; Apollo that of the hydra; of the love affairs of Zeus we have countless tales, and, among other things, he hangs his wife on an anvil. These and many other stories like them are merely supplementary additions, which attach to the gods in their aspect of natural forces by virtue of symbol and allegory, the origin of which we propose to discuss more fully later on. In modern art we shall, it is true, find certain indications which point to a conception of definite and at the same time universal powers. These are, however, for the most part simply cold and frost-like allegories of hate, envy, hope, love, faithfulness, that is to say, generally of virtues and vices in the actual truth of which we can retain no belief. For with us moderns it is the concrete subjectivity alone, for which we, in the representations of art, feel that

profounder interest, wherein abstractions such as these do not appear in their isolation, but are made to appear merely as phases or aspects of human character, whether we regard it in its particularity or as a concrete whole. In much the same way the angels possess no essential universality and self-subsistency such as characterize Mars, Venus, and Apollo, or even Oceanus and Helios. They are, it is true, objects of imaginative conception, but their specific character is that of vassals of the one Divine and essential substance, which is not in this case broken up into self-subsistent individualities, as we find it in the Greek Pantheon. For this reason we have here no imaginative vision of many objective powers dwelling in a state of tranquillity, which may be represented as essentially Divine personalities. We find, on the contrary, the essential content of such either as subsisting in the Godhead, or realized in a mode which is both particular and subjective in wholly human characters and actions. Nevertheless it was precisely in the conception[342] of self-subsistency and individualization that the ideal representation of the gods originated.

(b) The Individuals in the Action

In the cases we have just discussed of the ideal gods it is not a difficult matter for art to secure the ideality she requires. But in approaching the concrete action, ideal representation is confronted with a real difficulty. For though it is here that the gods and, in general terms, the universal powers may be identified with a principle which stimulates and compels activity, we are not therefore on the plane of reality entitled to find in them the source of genuine individual action. Action is rather essentially the manifestation of human life. Consequently there are in this connection two distinct aspects of the problem to be considered. On the one hand we have these universal forces in their self-subsistent repose and for that reason more abstract substantiality; on the other there is the individuality of men, in which we must seek the final spring and determinating impulse to action

no less than its actual accomplishment. It is, of course, only the simple truth that these eternally dominant powers are immanent in the identical nature of mankind, constituting, in fact, the substantive core of its character; but in so far as they are comprehended in their Divine nature themselves as individuals[343], and thereby in an exclusive way, their relation to the subject of human consciousness must remain an external one. And this fact enables us to see the essential difficulty we noticed above. There is, in truth, a contradiction immediately involved in this relation between the gods and men. It is quite true that the content of the gods is that which belongs to humanity, and announces itself as his passion, resolve, and will. It is, however, equally true that the gods must not only be assumed to be and comprehended as independent from man individually considered in their actual existence, but, furthermore, as the forces at the root of all his activity and determination. And this, too, in such a way that we are forced to consider the same determinations at one time as personified in the self-subsistent and Divine personality, and at another that which appears most essentially to belong to the human heart. And it is for this reason that the free self-subsistency of the gods no less than the freedom of human individuals in their activity is seriously compromised if, to the detriment of human independence, which we have already stated to be of most essential importance to the Ideal of Art, we ascribe an exclusive power of command to the gods. And we may observe this is precisely the same kind of difficulty which confronts us in the form of the religious conceptions of Christianity. It is stated in terms that the spirit of God leads up to God. Taken strictly such a phrase can only imply that the inward life of man is regarded as a purely passive ground, upon which the spirit of God labours. In such a conception the human will disappears as a free will, and at the same time the Divine purpose which motives the "in working" above

mentioned can only appear to man as a kind of Fate, under which he fails to come by his own true personality[344].

(α) If, however, this question of mutual relation[345] is so understood that man in his action is conceived as standing in a purely external opposition to God, here posited as eternal substance, the relation of both is one of pure matter of fact[346]. God gives a command, and man is obliged to hearken. Even great poets have found themselves unable to dispense with this conception of external opposition between gods and men. In the "Philoctetes" of Sophocles, for example, we find that Philoctetes, after he has confounded the deceit of Odysseus, persists in his determination not to return to the Grecian camp until Heracles appears at length as *Deus ex machina*, and orders him to yield to the entreaty of Neoptolimus. The content of this apparition is, no doubt, sufficiently motived, and answers to our own expectation; the catastrophe itself, however, is for all that not rightly homogeneous, but rather outside the action; and in his noblest tragedies Sophocles makes no such use of this kind of representation, according to which, if we but carry it one step further, the gods are reduced to lifeless machines, and individual men simply to the instruments of a foreign caprice. In a similar way we constantly in epic poetry meet with the active intervention of the gods represented in a mode which is external to human freedom. Hermes, for example, conducts Priam to Achilles; Apollo gives Patroclus the blow between the shoulders which ends his life. We also frequently find mythological traits treated in such a way that they appear as wholly external to the actual lives of the individuals thus affected. Achilles, for example, is dipped by his mother in the Styx and thereby rendered invulnerable and invincible to the one point of his heels. If we reflect on this rationally it is obvious that all real bravery disappears, and all that is heroic in the character of Achilles is converted from a real trait of his essential manhood to a purely physical advantage. Such a mode of

representation is, however, far more permissible to the epic than it is to the dramatic type of poetry, for the good reason that in the epic that aspect of spiritual life which is directly concerned with the intention implied in the execution of objects falls into the background and a larger field is, in general, offered for the play of external characteristics. Such a criticism of the prosaic understanding as the one above, which charges a poet with the absurdity that his heroes are no heroes at all, should only be advanced with the greatest caution, for it is partly in such traits as will appear shortly, that the poetical relation between gods and men is preserved. It is another matter, and we have nothing left us but prose, when in addition the powers, which are posited as substantive individuals, are mere empty shadows, the creations of the caprice of fancy and the arbitrariness of a false originality. They are then for the most part only the adjuncts of superstition or imbecility.

(β) The truly poetic relation of ideality consists, then, in the identity of gods and men; and this must assert itself even though the universal powers are presented as independent and free from the particularity of human beings and passions. In other words, all that we attribute to the gods must at the same time establish itself as that which is essentially cognate with the spiritual life of particular men in this sense, that while the dominating powers appear as essentially personified, yet at the same time all that is thus posited in an external relation to man is none the less clearly that which is immanent in his own spirit and character. The true function of the artist is, therefore, to introduce a mediating link between the difference involved in these two aspects, to bind them, in short, by a finely conceived thread of relation which, while clearly emphasizing their springs in the spiritual life of man, shall make no less visible the universal and essential element which is therein implied and present such to the imagination in individual form. The emotional life of man must reveal itself in the gods, who, in fact, are

the self-subsistent and universal embodiments of that which is active and dominant in his own spiritual experience. Then alone are the gods at the same time gods in cognate relation with his own heart and emotions. When, for example, we are told by the ancients that Venus or Amor has put a constraint upon the heart, no doubt in the first place these divinities are apprehended as external powers; but human love is equally a stimulus and a passion, which is implanted in the heart and is part of that it independently contains.

In much the same sense is the frequent reference to the Eumenides. We have to picture in the first instance no doubt these avenging maidens as Furies, who pursue the transgressor in an external form. But this pursuit is but another aspect of the Fury which drives through the soul of the perpetrator of crime; and Sophocles in the Œdipus Colonus (I. 1434) actually refers to them in this sense of inward spiritual forces, as the Eumenides of Œdipus himself, that is to say, who signify the father's curse as the result of the stress of emotion caused by the conduct of his sons. We have, then, and equally have not reason on our side whether we identify the gods with powers external to man, or find in them that which belongs exclusively to his spiritual life. They are in fact both. In Homer, for example, the activity of gods and men is a constantly involved skein[347]. The gods appear to accomplish what is foreign to human activity, and yet for all that execute only that which is in vital co-ordination with his own emotional life. In the "Iliad," for example, when Achilles, in the stress of controversy, is about to raise his sword against Agamemnon, Athene steps forth behind him and takes hold of his head of flaxen hair, visible only to himself. Hero, who is equally anxious over Achilles and Agamemnon, sends for them from Olympus, and their admission there appears to be wholly independent of the desire of Achilles. On the other hand we have no difficulty in seeing that the sudden appearance of Athene, the wisdom which puts constraint upon the

hero’s wrath, is simply a reflection of internal conflict, that the entire description but states in imaginative form what was experienced in the heart of our hero. In fact Homer himself points this out a few verses previously (“Iliad,” I, v, 190), when he relates about the debate that took place in his heart in the following terms:

ἢ ὅγε φάσγανον ὀξὺ ἐρυσσάμενος παρὰ μηροῦ
τοὺς μὲν ἀναστήσειεν, ὃ δ’ Ἀτρέιδην ἐναρίξοι,
ἠὲ χόλον πάυσειεν ἐρητύσειέ τε θυμὸν.[348]

This inward breaking up of anger into a divided self, this constraint, for it is in opposition to the anger, and Achilles appears at first to be wholly filled with wrath, the epic poet has a perfect right to represent at the same time as an external event. In a similar case in the “Odyssey” we find Minerva acting the part of escort for Telemachus. This attendance is rather more difficult to grasp as a personal experience of the emotional life of Telemachus, although we can readily fix on certain points of contact between the external image and the emotion experienced. And this it is we may generally say which constitutes the cheerful buoyancy of the Homeric gods, and the irony implied in the honour paid to them. Their self-consistency and seriousness are characteristics which tend to dissolve like a cloud, precisely to the extent that they unfold themselves as the very powers which are native to man’s emotional life, and thereby, in their manifestation, leave humanity alone with its own possessions.

However, it is not necessary to look so far abroad for a complete example of the conversion of a purely mechanical conception of Divine activity into the atmosphere of the subjective consciousness, the sphere, that is, of freedom and ethical beauty. In his Iphigenia in Tauris Goethe has in this connection carried the process through with a beauty that we cannot sufficiently admire. In the drama of Euripides Orestes in complicity with Iphigenia carries off the statue of Diana. This is simply an act of stealing. Then Thoas comes on the scene, and orders their pursuit, and the recovery of the bust of the goddess. Finally, in very prosaic fashion, Athene appears and orders Thoas to stay his hand on the ground that she has independently commended Orestes to the charge of Poseidon, and he, in deference to her wishes, has already carried Orestes far over seas. Thoas submits to her advice and replies to it in the following terms (v, 1442, 43): "Lady Athene, whoever, on hearing the words of the gods, does not obey them is but a fool. For how could it be right and fit to contend with the mighty gods."

In this relation we can only see the bare external command of Athene on the one side, and an equally futile submission of Thoas on the other. In Goethe's treatment of the subject, on the contrary, Iphigenia becomes herself exalted to the rank of a goddess, in reliance upon the truth she feels within herself, the truth of a human heart. In this sense she turns to Thoas and exclaims:

Is it then man alone who has the right
To accomplish things none ever heard before!
Shall he alone impress upon the strength
Of hearts heroic the impossible?

That which in the drama of Euripides the command of Athene effects, the change in the attitude of Thoas, Goethe's Iphigenia endeavours to bring

about, and in fact does bring about, through the depth of the feelings and ideas with which she confronts him.

With motions strange
An enterprise audacious soars within me;
A vast reproach and ills yet graver still
Will break on me if the event miscarry;
But, see, I place it on your knees! Be true,
Be only true and worthy of your fame,
So your assistance shall declare it truth,
Truth glorified through me.

And to this reply of Thoas:

What! you believe
The Scythian wild and the barbarian
Hear the wise voice of Truth and hearts humane
When Atreus of Greece still failed to hear.

she answers with the gentlest, purest trust:

Nay, all thus hear
Beneath whatever sky their birth was laid;
All needs must hear for whom the springs of life
Flow without let and purely through the soul.

Then it is she makes the final call upon her greatness of soul, and the tenderness of her faith at its highest point of effort; her entreaty touches, then masters and wrings from him, in a way that must appeal to every heart, the permission to return to her own. This alone is necessary. She has no need of the statue of the goddess; she can depart on her journey without

deceit or betrayal of trust. And it is with the finest sense of beauty that Goethe refers here to the oracular word of the god:

Bring but to Greece again the sister who
All loth at heart in holy temple bides
On shores of Tauris, and the curse is gone.

The very human reconciliation disclosed in these words is clearly that the pure and holy Iphigenia, the sister, is in fact the divine personification and the protectress of the house.

Noble and beautiful I wot in sooth
All that the goddess counselled seemed to me,

exclaims Orestes to Thoas and Iphigenia:

Like to a holy picture
The fate unalterable which walled our town
By one mysterious word, one word Divine,
Is banished, now that city takes thee back,
Who art the true protectress of our home;
Reserve thyself in holy quietness,
A blessing to thy brother and thine own;
It seemed that all deliverance on Earth
Had passed away, and all comes back with thee.

In the spirit of these healing words of reconciliation Iphigenia has already revealed herself to Orestes by virtue of the purity and ethical beauty of her inner life. It is true that her discernment drives him half mad, who in the convulsion of his spirit has lost all faith in peace; but the pure love of

the sister does not fail to heal him from every pang with which he is tortured by the Furies of his soul:

Within thine arms
The evil clawed me with its direst clutch
For the last time, and to the very marrow
I shuddered horribly: and then it vanished,
E'en as a serpent to its lair. Anew,
And all through thee, the day's breadth I enjoy.

Here, as elsewhere throughout it, we can hardly emphasize sufficiently our admiration for the profound beauty of this poem.

The material which has the impress of Christianity upon it is more open to criticism than that which was the subject-matter of antique art. In the sacred legends, and generally speaking where the religious conceptions of Christendom prevail, no doubt we may find the appearance of Christ, the Virgin Mary and other saints the subject of universal belief; but along with them the imagination has clothed itself with fanciful aberrations in every direction, so that witches, ghosts, and every sort of spectral apparition are yet more conspicuous objects. In the face of such conceptions, so far at least as they appear foreign powers to our human nature, and man submits himself unreservedly to the charm, seduction, and influence of their illusions, artistic representation is wholly given up to every kind of folly and caprice of mere contingency. It is of unique importance that in the treatment of such material the artist take care that the freedom and independence of judgment are in no way impaired. Shakespeare has shown us how to do this in most noble fashion. The witches in Macbeth, for example, appear as external powers, who foretell for Macbeth his future destiny. What they *do* foretell, however, is precisely that which is his own most secret wish, which is reflected back on him and declared in this,

merely in appearance, external form[349]. With a still closer regard to beauty, yet profounder insight, is the ghost in Hamlet treated as the purely objective embodiment of Hamlet's own intuitions. We find Hamlet in the first instance overpowered with a vague feeling that something horrible has taken place. His father's ghost then appears and gives definite form to these awful premonitions. We naturally expect that Hamlet, after receiving the facts set forth in his father's warning, will at once proceed with energy and bring the murderer to book, a revenge which appears to have ample excuse. But he delays and delays. Critics have made this inactivity a matter of reproach to Shakespeare, blamed him, in fact, as though for this reason the play to some extent never gets properly off. But we must remember Hamlet is not a strongly practical nature, rather a finely strung one, with emotions held in persistent reserve; a nature which finds it difficult to tear itself from its internal harmony; melancholy too, prone to subtleties, hypochondriacal, with emotions deeply rooted. For this reason it is obvious that he is *prima facie* indisposed to prompt action. And this is fundamentally Goethe's conception of him when he tells us that what Shakespeare sought to represent "was the imposition of some supreme action on a soul whose growth was unadapted to its execution." He in fact interprets the entire drama relatively to this conception of Hamlet. "We have here," he maintains, "an oak tree planted in an exquisite vase, which ought really only to contain and shelter the fair flowers; the roots spread, the vase is shattered." But it should be noticed that Shakespeare, when referring to the apparition of the ghost, contributes a far profounder trait of character in explanation of this debated point. Hamlet delays, because he does not right off wholly believe in the ghost.

The spirit that I have seen
May be a devil: and the devil hath power
To assume a pleasing shape; yea and perhaps,

Out of my weakness and my melancholy,
As he is very potent with such spirits,
Abuses me to damn me: I'll have grounds
More relative than this: the play's the thing,
Wherein I'll catch the conscience of the king.

In this passage it is obvious that the apparition as such does not leave Hamlet merely devoid of all stability[350], but that he entertains a reasonable doubt, and is determined to make his conviction a certainty by his own experiments before he proceeds to act upon it.

(*γ*) As a summary description of these universal powers, which appear not merely in their external independence, but are the vital and moving forces in the human heart and all that is implied in its most intimate life, we may borrow an expression in use among the ancients, that is to say Pathos (*πάθος*.) To translate this word adequately is not easy. Passion almost always implies as its concomitant an element of meanness or baseness. We contend in ordinary parlance that a man should not surrender himself to his passions. It must therefore be understood that we use the expression pathos in a nobler and more universal sense than this without the slightest implication of anything blameworthy or egotistic. The devoted love of the sister Antigone is an excellent example of a pathos in the full significance of the Greek use of the term. Pathos in this sense is a power of the emotional life which completely justifies itself, an essential part of the content of rationality and the free will. Orestes, for example, kills his mother not so much on account of any force of his emotional life which we strictly can call passion; rather it is a pathos in itself fully considered upon and essentially sane which carries him on to the awful deed. Thus understood we may add that it is impossible to say that the gods possess pathos. They are merely the universal content of that which is the stimulating energy in the resolves and actions of human individuality. The

gods as such continue in their repose and freedom from passion, and however much they may quarrel or contend among themselves, there is nothing really serious in it all, or their strife possessed merely a symbolical significance in the view we may take of it as a universal war of the gods. We must therefore strictly limit pathos to the actions of mankind, and conceive thereunder the essential or rational content, which is present in the human consciousness identical with itself and throughout suffuses the emotional life.

(*αα*) We may say, then, that pathos constitutes the true mediating link[351], the veritable domain of art. The representation of it is the most truly effective part of a work of art, as it is its influence upon those who look at it. Pathos sets a string in motion, which vibrates through every human heart. Every one must know the type of worth and reason, which underlies the content of a genuine example of pathos, must recognize it at once when he sees it. And the cause of this is that pathos moves us because it is that which is essentially the vital force of our human existence. And it equally follows that that which is wholly external, the natural environment and particular scene, in its active support of the effect of pathos, need only be treated quite subordinately. Nature must in consequence be drawn upon as a fact essentially symbolical and suffer the pathos to re-echo from her walls, which is the most real subject-matter of artistic representation. Landscape is, for example, a type or genre of painting of less importance than historical painting; but even there we find that the school of landscape most independent should not be without a general harmonic relation to human feeling, and, in fact, possesses a certain type of pathos. In this sense we are told art generally ought to touch the emotions. Before accepting this principle, however, we ought first to inquire through what means this peculiar effect of art must be brought about. "To touch the emotions" is in general the activity of something in union with feeling, and mankind, more

particularly the mankind of to-day, are, or a more considerable portion of them are, only too readily open to such experiments. The man who showers tears on us, starts the seeds of tears, which grow up fast enough. In art, however, only that ought to move us which contains in itself the real import of pathos.

(*ββ*) For such reasons we may affirm that neither in comedy nor in tragedy ought pathos to be that which is only folly or personal idiosyncracy. Shakespeare's Timon, for example, is on purely material grounds a misanthrope; his friends have eaten him up, consumed his substance, and when he himself requires their gold desert him. He consequently becomes a passionate enemy of mankind. The situation is both conceivable and consistent with nature, but it contains no pathos that can be justified on principle. Even to a more striking extent is the hate we find in "The Misanthrope," that play of Schiller's apprenticeship, purely a vagary of modern ideas. For in this latter case the misanthrope is in addition a thoughtful, perspicacious, and entirely noble man, great-hearted towards his peasants, whom he has freed from their villeinage, and devoted to his daughter, who is, apart from her beauty, in all respects worthy of his love. In much the same way, in that novel of August Lafontaine, Quintius Heimeran von Flaming is worried with the follies of mankind. It is, however, our most latter-day poetry which, above all, loves to wind itself into every conceivable knot of fantastical falsehood[352], attempting thereby to secure an effect through mere oddity, but failing to find the slightest response in any sane person for the reason that every vestige of what is really present in human life has vanished from such refinements of mental athletics.

In another direction we may remark that everything which depends solely, that is to say, in so far as scientific apprehension is the main requirement, upon instruction, testimony to the truth, and insight of what is offered as such, is no fit subject-matter for the representation of a genuine

pathos. The facts of *scientific knowledge* are a part of this material. And the reason of this is that science demands a particular form of education, an effort towards and a knowledge of the specific forms of science and their relative importance of exceptional variety and extension; an interest in this type of study is by no means a universally moving influence in the hearts of men, but is limited and must ever remain limited to a narrow circle of votaries. The treatment of purely *religious* instruction presents similar difficulty, if we mean by that the development of the same in its profoundest import. No doubt the universal content of religion, such as the belief in God and similar theses, is of the deepest interest to anyone worthy of it. Art is, however, not directly concerned either in the exposition of religious dogmas, nor, indeed, in any exceptional insight into their truth; it is consequently of importance that she should be held aloof front such disquisitions. It is all the more necessary that we should through art entrust every type of pathos to the human heart, every motive of ethical significance, which are of practical and vital interest. The influence of religious ideas is rather upon the subjective world of emotion, the heaven of the heart, the ever-repeated consolation and uplifting of the individual life, than upon direct action in the strict sense. For that which is Divine in religion on its practical side is morality and the powers which are potent in the ethical life. These powers, however, in contrast with the heaven of religion in its purest form, are in definite relation to the world and that which is entirely human. Among the ancients this worldly content was fundamentally included in their conception of Deity, and consequently their gods could be related directly to human action and its artistic presentation.

From all this it will readily appear that the significant moments of volitional activity which present to us the pathos we have just endeavoured to define are numerically small and the range of them restricted. In the opera especially it is inevitable that the sphere from which such may be

selected is a narrow one; we consequently have for ever dinned in our ears the plaints and delights, the misfortunes and happiness of love, fame, honour, friendship, maternal and marital devotion.

(*γγ*) Now a pathos of this kind requires for its display not merely the power of exposition, but also that of perfected *elaboration*[353]. And what is more, the soul which entrusts to its pathos the spiritual wealth it possesses must be one with real wealth to dispose of, and not one that can rest in a condition of purely intensive self-concentration. It must, in short, be ready to give an outward semblance to its self-expression and rise to the finished perfection of that. The distinction between this power of self-concentration and that of self-revelation is of great importance; and we shall find that in this respect the types of individuality such as generically represent different races offer essential points of contrast. Nations whose reflective consciousness has been highly trained are more eloquent in the expression of their passions than others who are not so. The ancients, for example, were accustomed to unfold the pathos, which is the animating principle of human personality, in its profoundest significance, without running off into cold generalities or empty tattle. The French also in this respect are naturally gifted, and their eloquence in the expression of passion is not by any means always merely a piling up of words, as we Germans, following the bent of our national reserve, to which the repeated expression of emotion appears to be a kind of wrong inflicted upon it, are only too ready to think it is. In fact, we have gone so far in this direction that we could mention a distinct phase in our poetical history, when the younger spirits, at any rate, sick to death of that which they dubbed "the flush of French rhetorical water-drops," yearned to such an extent after the simplicity of Nature that their artistic energy could only express itself for the most part in interjections. It is hardly necessary to observe, however, that we shall arrive at no "open sesame" with Ahs and Ohs, a damn here and there thrown in, or

any other random note of storm and bluster. The inspiration of mere interjections is a feeble one, or rather is simply the way in which the still unrefined nature expresses itself. The spirit which is to reveal to us pathos must be a spirit which is full to running over, which is able to spread itself abroad and give expression to its virtue.

We may add, too, that in this respect Goethe and Schiller present a most marked contrast. Goethe is less pathetic than Schiller, makes use of a mode of artistic expression which is more intensive; more especially in his lyrics we are struck by this characteristic of self-reserve. His songs, and this is the true quality of the pure lyric, go naturally on their way, without entirely giving us all that they contain. Schiller, on the contrary, is clearly anxious to unfold the pathos of his subject to its furthest limit, and with all the clearness and force of expression he can muster. Claudius in "Wands-becker Boten"[354] has contrasted Voltaire and Shakespeare in much the same fashion, maintaining that the one *is* what the other only *appears* to be. "Master Arouet tells us: 'I weep'; Shakespeare really weeps!" To this we can only reply that it is precisely with such telling and appearance that art is concerned and not with the mere positive fact. If Shakespeare merely wept while Voltaire made others think he wept, so much the worse for the poet Shakespeare.

To conclude, then, it is necessary that pathos, in order to be in itself concrete, as it should be in ideal art, be presented in its artistic manifestation as the pathos issuing from a spiritual nature, rich and comprehensive. And this result carries us forward to that third aspect of our consideration of "the action" already adverted to, that is to say, an inquiry into what is implied by *character* in this connection.

(c) Character

We will summarize the proceeding argument. Our point of departure was the *universal* and substantive powers which are the original stimulus to

action. Such require as the medium of their active realization human *individuality*, in which they then appear as *affecting* pathos[355]. But, furthermore, the universal inherent in these powers must in particular individuals acquire the concentrated unity and concreteness of a *whole*, and a *single whole.* This totality is man apprehended in his fulfilled spiritual content and the subjectivity therein comprised, in one word the entire self-contained human individuality which we designate as character. The gods are born into the pathos of men, and pathos in its more concrete form of activity is human character.

In character, then, we find the real focus[356] of the ideal exposition of art, that is to say in so far as the embodiment unites in itself the separate aspects of it already developed as consistent phases, in the construction of its own totality. For the Idea as *Ideal*, by which we mean as clothed in a form within the grasp of sensuous imagination and perception, and in its activity as action and accomplishment, is, if we define it strictly, just this self-relation of the *subjective individuality.* The individuality, however, which is truly *free*, and nothing short of this will satisfy the Ideal, has not merely to declare itself as universality, but at the same time, to assert its nature as concrete singularity, as the mediating bond which unites and transpierces both sides thus related, which in their *self-related* actuality subsist as unity. And this is precisely what we understand by character, the ideal form of which consists in the wealth of energy with which all the constituent aspects of the subjective life are welded in one whole.

We will now inquire rather more closely into the nature of this conception of character viewed under three distinct aspects.

First, as co-extensive[357] individuality, that is to say, with, our attention directed to the wealth of substance contained in it.

Secondly, with direct reference to its particularity, the form in which it is bound to appear, albeit still a totality, as one that is more *defined* or specific.

Thirdly, in our final apprehension of it as a unity which is fully identified with its own determinate form, that is, which is throughout fused with the same by virtue of its own principle of subjective self-identity, and thereby attaches to the whole the significance of an essentially *assured* character.

We will now develop and elucidate more fully what we conceive to be implied in the above general propositions.

(α) And first we would draw attention to the fact that this pathos, though an essential feature in the development of completed individuality, is not, in the specific form of its appearance, the *sole* or exclusive interest of the individuality portrayed. It is, in fact, merely one aspect of the efficient[358] character, if one of paramount importance. To put it in rather a strong way, the human soul does not merely carry within it *one* god as the original of its pathos; on the contrary, the spiritual scope of humanity has wider borders, and we may affirm that many gods make their dwelling in one true man, or, rather, all the powers which are scattered throughout the heaven of the gods are enclosed within that one breast. It is co-extensive with the entire field of Olympus. In this sense one of old has said: “Out of thine own passions, O man, hast thou created the gods.” And, as a matter of fact, in proportion as the intelligence of the Hellenic folk quickened, the number of their gods increased; and, furthermore, the gods of their earliest days were less intelligent, that is to say, they were god-like figures deficient both in individuality and determinate character.

In this wealth of content, accordingly, it is necessary that the character adequate to ideal art should display itself. And this is just that which creates the interest we feel in a character, namely, that a totality such as that we have above described emerges from it, and the character, while reposing on its abundance, nevertheless persists in perfect equality with itself, as one

secure and self-excluding subject. If the character, however, be not conceived and depicted as this rounded and subjective unity, is abstract in the sense that it is entirely the sport of one passion, such must then appear as self-destructive[359], or at least cracked, weak, and without real fibre. For the weakness and inertness of individuals is just this very thing, that the eternal forces of which we have spoken never assert themselves in them as a real part of their most essential substance, as, to put it logically, predicates which adhere to them as the subjects of such.

In Homer[360], for example, every hero is the living focus of a whole congeries of qualities and traits. Achilles is the most youthful hero in the host, but his youthful exuberance is represented as quite compatible with all other entirely human qualities, and Homer unfolds before us this variety through situations which offer the finest contrast. He loves his mother, Thetis, he weeps for Briseis, when she is snatched from him, and his violated sense of honour drives him into the conflict with Agamemnon, which is the original fount of all the events that follow after it in the "Iliad." Add to this he is the truest friend of Patroclus and Antilochus; moreover, he is the most blooming, fiery youth, swift of foot, brave, yet full of reverence for gray hairs; the faithful Phoenix and trusty servant are at his feet, and at the funeral of Patroclus the hoary Nestor is treated with the highest deference and honour. And, in contrast to all this, Achilles is represented as inflammable to a degree, effervescent, revengeful, and full of the most brutal austerity when face to face with the foe. He binds the slain Hector to his chariot, trails the corpse in fell hunter's fashion three times round the walls of Troy; yet stays his anger when the old Priam comes to his tent, and, as he thinks within his heart of his own old father, reaches to the weeping king the hand which has done to death his son. Of Achilles we may well exclaim: "here is a man indeed, and human nature, ay, noble human too, in all the length and breadth of its riches, is unveiled before us in this one

man!” It is just the same with all the other Homeric characters — Odysseus, Diomedes, Ajax, Agamemnon, Hector, Andromache — every one of them is a whole, a world in itself, a complete and living member of humanity, something very different at least from your allegorical abstract of some one particular trait. What frosty, faded personalities, despite all their vigour and rigour, are the horned Siegfried, Hagen of Troy, nay, even Volker, the musician, in comparison.

It is this variety of characterization, and this alone, which can give to a character the interest of life. At the same time this fulness of detail must really appear as included in the personality itself, that is, it must not strike us as the mere diversion, passing freak, or suggestion of an excited fancy, such as we see in the case of children who will take up everything in turn, and even make something out of it, yet, for all that, are without essential character. Character in this latter sense will penetrate and make itself a home in the most diverse phases of the emotional life of man, will steep itself to overflowing with that abundance, and, at the same time, not remain thus immersed, but throughout all the congeries of interest, objects, qualities, all the traits that distinguish or arrest it, maintain the form of its self-exclusive and alert subjectivity intact.

For the representation of such exhaustive types of character epic poetry is, above all others, adapted, dramatic and lyrical poetry are less so.

(β) Art, however, will not be content to remain at the point which the course of our inquiry has reached, namely, the notion of character as a mere congeries of traits. For the object we have before us now is the Ideal in its specific determination, and singularity, or, rather, concrete *individuality*, are both of them prominent and necessary features. Action, more than anything else, in its conflict and reaction is impossible without some restriction and clear definition of form. For this reason the heroes of dramatic poetry are for the most part of simpler definition than those of epic poetry. And the

way we get at a clear definition is through some pathos out of the ordinary which is so portrayed as to make some essential trait of character stand out in bold relief, and itself to be the stimulus to particular objects, resolves, and actions. If, however, this simplification is carried so far that any character appears as though it were pared down to a mere shadow-like semblance of any form of pathos, such as love or honour, all real vitality and spiritual depth must necessarily vanish, and the representation, as is not unfrequently the case in the French school of drama for this very reason, can only offer us a cold and jejune result. We may therefore conclude that in this aspect of particularity the prominent feature which asserts itself pre-eminently will be this, that within the borders of this very limitation the fulness of life is completely preserved, so that the personality in question has free scope allowed it for further expansion in many directions, a power to adapt itself to every variety of situation, and, in short, is able to unfold and express in every possible way the wealth of a truly complete spiritual life[361]. Despite the supreme simplicity of their pathos the characters in the Sophoclean drama possess this intrinsic vitality. We may indeed compare them in their plastic self-seclusion to the figures of sculpture. For it is also quite possible that sculpture express very various delineations of character despite all the tenacity of its definition. In contrast to the bluster of overpowering passion, which concentrates all its forces upon one single point, it exhibits out of its tranquillity and speechlessness that predominant neutrality, which peacefully envelops all powers within itself; but this unperturbed unity does not, however, persist in any indissoluble union with mere formal definition, but, rather, in virtue of its beauty, suffers at the same time the birth-throes of all that pertains to it to disrobe itself as through a cloud of immediate possibility into fresh relations of every variety. In the finest figures of sculpture we behold a tranquil depth, which unfolds, as it were, the pregnant womb, from which all other potencies may

be born. In contrast with sculpture it is yet of more vital importance to the arts of painting, music, and poetry, that they should display the inmost complexity of character, and real artists of every age have recognized this. In Shakespeare's "Romeo and Juliet," for example, the most pathetic characteristic of Romeo is his love: but he is also placed before us under relations of the greatest contrast, whether it be in reference to his parents, his friends, his love troubles, or his affair of honour in which he fights with Tybalt, his attitude of deference and trust to the monk, nay, even on the verge of the grave his conversation with the apothecary, from whom he purchases the poison. Throughout he is the same worthy and noble man of deep emotions. In the same way the character of Juliet is unfolded throughout the range of her relations to father, mother, nurse, the Count Paris, and father Lawrence. And, despite of this, she is as deeply immersed[362] in her one preoccupation as she is in every one of these situations, and her entire character is transpierced with and carried away by the one single emotion, her passionate love for her lover, which is as deep and broad as the unbounded sea, so that it is but the simple truth when she exclaims, "The more I give, the more I possess, both are infinite."

From all this it appears that even when there is but one pathos visible, it must unfold itself as the wealth of all it possesses. And this is what really happens even in lyrical poetry, where we find the pathos is not attached to actions determined by positive circumstances and conditions. For in this latter case the pathos can only assert itself as the spiritual state of an emotional nature otherwise complete in itself, which is, that is to say, free to express itself in any other conceivable circumstance and situation which may confront it. The use of words of vital significance, an imagination which can associate itself with all the world, can restore the Past to the Present, can transform the entire external environment of man's life to a symbolical expression of his spirit, can bravely adventure into the depths of

comprehensive thought, and, while doing so, reveal an exuberant, capacious, clear, exalted, and noble nature — a wealth of character such as this, freely expressing such a world, is a prize indeed for the Lyric Muse. No doubt a purely logical reflection may find it impossible that such, variety of character should co-exist with a masterful clearness of type. We may be asked, for instance, in reference to the heroic character of Achilles, whose strength of youth is the pre-eminent, trait of his beauty, how it is possible to reconcile the tender heart so manifest in his relations to his father and his friend with the cruel act of revenge wherewith he drags Hector round the walls. Precisely the same kind of inconsequence is to be met with in Shakespeare's clowns. They are, with scarcely an exception, bubbling over with wit and the humour of genius. And, no doubt, there will always be fools enough to ask us how men thus spiritually gifted could ever betake themselves to such tomfooleries. The truth is that the reflection of the formal logic is sure to emphasize one aspect of a character, and conclude that the entire man is minted under its impression to the exclusion of all others. To such everything that asserts itself as alien to the hallmark of its beggarly mintage can only appear as an inconsequence. In the truely rational contemplation of the whole as distinct from the parts, and thereby of the living thing, that which appears as inconsequent will be precisely that which brings all into fit co-ordination. For our humanity is just this very paradox. We have not merely to carry the contradictions of our complex nature, but to suffer the load[363] with patience, and throughout prove staunch to our burden.

(*γ*) We may conclude, then, that character must fuse together its particularity in the element of its spiritual substance; it should possess a definite type, and at the same time retain in this distinction the force and stability of a *single* fully self-consistent pathos. Where we find our humanity represented without such a centre of unity, the different aspects of

such variety it may possess will lose all relative meaning or significance and fall away from each other. In art we shall find that what we distinguish in our conception of personality as infinite or the Divine is just this self-consistency in unity. If this view be a just one it is obvious that such characterizations as stability and determination are of great importance in the ideal representation of character. And we shall only obtain such a result, as already observed, in so far as the universality of the powers inherent in our humanity are permitted to transpierce the mere particularity of the individual character and, by virtue of the unity thus set up, create a subjective and at the same time individual life which supplies its own principle of unity and self-identity.

Such a condition is all important, and we must now advert to a number of artistic compositions, more particularly of later times, in express relation to it.

In the "Cid" of Corneille, for example, the collision between the opposing principles of love and honour is a match, no doubt, of brilliant effects. A pathos of this kind, involved as it is in the opposition of distinct forces may, no doubt, be the operative ground of conflicts; but when we find such portrayed as the spiritual struggle of one and the same character, though such antagonism may very readily supply us with the material for brilliant rhetoric and effective monologue, the cataclysm which is here presented in the emotional life of one person driven thus by turns from its abstract subjection to honour into the equally abstract one of love, and forthwith hounded back again, is not favourable to the portrayal of a character of genuine stability and homogeneousness.

It is equally inconsistent with the delineation of resolute personality when a leading character, already under the predominant influence of some specific pathos, is portrayed as one overmastered by the direction or

persuasion of a subordinate character, such is thus enabled to shift the responsibility upon other shoulders. This is what actually takes place in the "Phedra" of Racine when the mind of Phedra is depicted as entirely motived by the words of Oenone. A character of real distinction acts out of its own initiative, and will not suffer the views of a mere stranger to be that which determines its own resolution. Only when action is the direct result of its own reflections do we get that clear relation between personal initiative and the consequent result which carries with it the full weight of guilt or responsibility.

We find yet another type of this instability of character as quite a peculiar possession of the more recent literary output of Germany. It is a type of character in which a kind of flatulence in emotion is the rule no less than the source. The classic example is the Werther of Goethe's romance, a thoroughly morbid type of character, without any vestige of real manliness such as might carry him beyond the egotism of his love-passion. What makes him interesting is the passion and beauty of his emotional life, the intimate fellowship between himself and Nature which the course of his spiritual experience and the pliability of his temperament accentuate. This effeminacy has yet more recently embodied itself in many other forms of expression which descend with increasing rapidity to the lowest circle of jejune and tasteless egotism. We must not even omit, for instance, to include in our list that illustration of the lovely soul which we find in Jacobi's "Woldemar." In this romance we are made a present of the glory of emotional volubility in all its pretensions. It would be difficult, indeed, to cite a better example of the self-deceptive illusion of personal virtue and excellence. Here we have all that sublimity and divinity of soul, which relates itself crookedly to every possible aspect of the actual world; that type of feebleness which is wholly unable to share in or tolerate any portion of the labours or interests of practical life as it really is. So rooted is it in its

own consciousness of superiority it passes everything as unworthy of it on the other side. It is, in fact, a peculiar feature of this type of "lovely soul" that, even when face to face with the truly ethical interests and wholly sane objects of life, instead of meeting them frankly, it retires into the seclusion of itself, where it weaves its own threads of finery and passes its time in hatching out its exquisite brood of religious and moral reflections. And connected closely with this personal enthusiasm for our superabundant excellence, which we set forth in front of ourselves with such a brave show, there will always be an intense sensitiveness for all other beings who may appear at any moment to sympathize with, comprehend, and appreciate this beauty of the solitary life. If such fellow-feeling is not forthcoming we find the very heart of us troubled to its depths and infinitely bruised. We have lost at one stroke all humanity, friendship, and love. We are unable to put away with whatever act of pedantry or rudeness may be in question, some trivial circumstance or stupidity over which the vision of any character of breadth or strength would pass without a tremor. It whirls away the thought of everything else, and that which is by itself of least significance proves to be that which finally most reduces us to despair. Such is the source of all that endless train of melancholy, trouble, heartache, peevishness, sickness, dejection, and poverty of spirit which follows, such the spring of all those self-torturing reflections one on the top of another, that cramp and obstinacy, nay, finally, that cruelty of soul, through which the wretchedness and weakness of the spiritual content of such a type, of "loveliness" consummates and declares itself. No heart that is truly sound can wish to unite itself with such an emotional hermitage. For it is a fundamental characteristic of all genuine character that it carries within itself both the courage and the strength to do and to will some actual thing. The interest, therefore, that such natures which are for ever revolving round themselves may arouse in us is after all an empty interest, and necessarily so despite all

the conviction with which such natures may assure us that they belong to a higher and purer sphere than our own, a sphere which has revealed to our vision that peculiar type of the Divine they have uncovered from their secret parts and finally present to us, to borrow an apt figure, *en negligée.*

This want of genuine solidity of character appears in yet another form where we find the particular manifestations of this world of "fine feelings" turned as it were upside down and hypostatized as independent forces. Much that passes for magic, magnetism, spiritualism, the apparitions of *clairvoyance*, the morbid condition of sleep-walking, is attributable to this source. The living person in question is placed in a relation to these abstruse powers, which from one point of view identifies him with them, and in another makes them appear as something foreign to his spiritual life, which determines and controls it. It is assumed that underlying these undefined forces there is some inexplicable truth which borders on the marvellous, or at any rate passes comprehension. From the world of art, however, all such powers of darkness should be banished. In art there is no darkness at all, but all is lucid and transparent, and in adventuring after such types of myopy speech merely flounders into spiritual disease, or plays loose as poetry with the nebulous, empty, and trivial, a good example of which is the verse of Hoffmann, and that piece by Henry von Klust entitled the "Prince of Homburg." The truly ideal character has nothing in his composition, or the pathos which expresses it, of another world and its ghosts, but only actual interests, in which he finds himself at home. More particularly is this feature of *clairvoyance* become a trivial and vulgar recipe of our more modern poets. In Schiller's "Tell," on the contrary, when the old Attinghausen on the brink of the grave foretells the destiny of his country, the prophetic instinct is quite in its right place. It is always, however, a misfortune for an artist to find himself forced to exchange the sanity of a character with some malady of the soul whether it be to motive the collision

or excite interest. For this reason he should only avail himself of the condition of insanity in quite exceptional cases.

In conclusion we may connect with these distortions of a sane vision, which are so much opposed to all real unity and consistency of character, the principle of our latter-day irony. This false theory has betrayed the poet into grafting upon his characters qualities so essentially diverse that they are incapable of all homogeneous relation; the essential unity of every character is thus confounded. According to this theory a character is first presented as characterized in a certain way, and immediately after we have that very determination converted into its opposite, and the character itself is propounded to us as nothing more than the negation of what it was and is. Moreover this very futility is accepted by this irony as the supreme discovery of art. An audience should not, in short, be carried away by an essentially positive interest, but should be pulled up at the critical moment, much as the irony itself is no sooner launched upon anything than it is off again. They would even explain the characters of Shakespeare according to such a principle. We are informed that Lady Macbeth was an irreproachable wife of the tenderest feeling, despite the fact that she not only falls in with the suggestion of the murder, but actually eggs her husband on to its execution. But if the signet mark of Shakespeare is conspicuous on any one quality it is on the firm and decisive delineation of his characters, even when it is only the formal greatness and consistency of evil that is in question. Hamlet, it is true, is a case of mental indecision, but even he is only in doubt as to the way he shall carry out his purpose, not at all as to what has to be done. Yet nowadays they would assimilate even Shakespeare's characters to a world of ghosts, and appear to think that this futility and indecision of ups and downs, this general squeamishness[364] in short can by itself contribute to our interest. The Ideal, however, is centred in this, that Idea is made *actual*, and our humanity is associated with such

actuality as subject and consequently as a unity which is essentially firm-rooted.

We may here, so far at least as this portion of our inquiry is concerned, bring our observations upon the individuality which is consistent with real character to a close. That which we have mainly sought to emphasize is a pathos which is at once self-determined and essential, the possession of a rich and complete nature, the spiritual world of which such a pathos transfuses under such a form that this process of transfusion no less than the pathos itself receives its artistic presentment. At the same time this pathos must not be allowed to come into conflict with itself in the hearts of men so as to stultify its very nature and consistency as pathos.

III. THE EXTERNAL DETERMINATION OF THE IDEAL

Our consideration of the determination of the Ideal was in the *first* instance occupied with the general inquiry why it was and how it came about that the Ideal ever received at all the definite embodiment of a particular form. Following after this we arrived at the conclusion that inherent process was essential to our notion of it, that in fact the element of difference was only by this means asserted within it, and that this process viewed as a whole is presented us in the action. We discovered, however, that in virtue of the action the Ideal passes over into actual relations with the external world; we have therefore, and this is the *third* important step, to solve the further question what kind of form this its final aspect, as associated with external reality, the Ideal will receive under adequate artistic representation. We would recall the fact that the Ideal is the Idea under a form which is in union with its own *actuality.* Up to the present point of our inquiry our attention has been exclusively occupied with that aspect or phase of this actuality which we may call in general terms human individuality and its character. Man is, however, also in possession of a concrete and *external existence.* In separation from this it is true he

concentrates his spiritual life to a point in self-consciousness, but he remains for all that, even in this subjective unity, immediately related to the external world. To the actual existence of mankind the surrounding sphere of a world is as indispensable as the protection of a temple is to the statues of the god it contains. And for this very reason we must now advert to all or some of those many diverse threads, whereby the Ideal is woven in with this external environment and is shown in relief against it[365].

This opens to our view a practically immeasurable expanse of relations and modes under which the process of the external and relative world is determined. For in the first place we are confronted at once with the bare facts of external Nature such as particular locality, situation, whether habitable or not, temporal condition, the nature of the prevailing climate, whether in our earth's northern or southern hemispheres, and in fact in whatever direction we advance we have a fresh picture before us. Moreover, external Nature is made use of by man to satisfy his own needs and purposes; and all the ways under which he converts her to that use, that is to say the adroitness with which he discovers and then equips himself with tools and a home to live in, with weapons, with seats to recline upon, carriages to ride in, nay, all that the art of cooking may bring with it for his food, the entire apparatus of his luxury no less than his comfort, all this and much more fall within the limits of our inquiry. Add to this the further and yet more important consideration that every man lives within a comprehensive and equally real world of spiritual relations, which itself, too, presents to his view all the different modes under which command and submission is maintained, that is to say the family, blood-relationship, property, country and town life, the *cultus* of religion, the organization of defence and offence, civic and political associations, private society, in short every conceivable form under which ethical customs and usages are

organized in the institutions and permanent activities which contribute to the actual environment of human existence.

In all the directions enumerated above the Ideal is in immediate contact with the reality of the practical world in its everyday dress, or in other words, with the commonplace prose of life. And impressed by this fact we may easily be led to the conclusion, if we have already accepted the nebulous conception of idealism elaborated recently, that art can have no alternative but to dissever herself absolutely from all connection with this world of relative appearances. Such at least can only be logically inferred from a theory which assumes that this relation of externality is one of pure indifference, or rather, in contrast to the subjective world of spirit, is of no substantive significance or worth. Agreeably to this view art is a spiritual dominion, whose sole object is to exalt us above the sphere of material wants, necessities, and dependence, and to liberate us from the logic, and we may add the comedy, of facts, which in this field claim the exclusive attention of our humanity. For, apart from any other consideration, all that meets us upon this *terra firma* of life's prose is for the most part of a purely conventional character, and, conditioned as it is by time, space, and custom, simply a congeries of contingent facts, which it is derogatory to the nature of art to accept. This view of ideality, which is really an illusive one, is in part due to one of those highly flavoured abstractions of our latter-day thinking, in which we merely find that the thinker's courage has failed him to come to terms with the external world in question; in part also it is due to that type of prepossession which drives a man to assert summarily his independence of practical necessities when the advantages of birth, status, and social position have not already effected this for him. For such a man the only relief available is a complete withdrawal into the secret world of the emotions, a prison-house of unreality he steps out of never. Here he remains in what he conceives to be the temple of wisdom gazing ecstatic at

what he takes to be the stars, and naturally values at the price of a nutshell all that is found on the Earth. The real Ideal, however, is not confined to the shadow-like world of the emotions, but in its perfected whole must freely borrow from the definite structure of external objects of sight in every direction. And the reason of this is that man himself, whose nature is the central source that gives to that Ideal all its significance, is alive, and his life is only actual in a particular place and time, as one with the Present, as the individualized type of infinity[366]; and in short the opposition of an external garland of Nature is a fundamental characteristic of his life and its association with him and his activity is imperative. It follows that if this activity is to be apprehended by art, not merely as belonging to man alone, but in the specific form it may take in that world of appearance, the mode of its existence there will assert itself, as the mobility, reaction, and animating force of life itself in contact and transfusion with the material complex which surrounds it.

Man is, however, in virtue of his self-consciousness a world in himself[367], and as such is differentiated from the external world of Nature which confronts him; and this external world is equally with himself a rounded whole whose unity asserts itself in the principle of causality. This self-exclusion of these two worlds is, however, only apparent; they are in their separation essentially related, and it is precisely this association which constitutes concrete reality, whose artistic embodiment is the content of the Ideal. And this brings us once more to the question already mooted, namely, in what semblance or form the external material which we find in this mutually related world we have referred to as concrete reality[368] can be presented to us by art in a manner consistent with the Ideal of art.

We will once more accept the triple division of our subject-matter, and examine a work of art from three distinct points of view. *First*, there is the

material of externality accepted in the bare abstractness of its forms, such as space, figure, time, colour, which we must consider relatively to the artistic form most adapted to it.

Secondly, we must consider externality in its full and actualized concreteness, as above explained, a mode of reality which imperatively requires in a work of art that it should be in close affiliation with the subjective content of the spiritual life of man immediately related to it.

Thirdly, our consideration will be directed to the important fact that a work of art is created for the delight of human perceptions, for a public in short, which justly claims that the objects of art should bring home to it the interests of its spiritual life, its real beliefs, emotions, and ideas, so that it may enter with a genuine response into their artistic presentation.

1. THE CONDITION OF EXTERNALITY IN ITS SIMPLE ABSTRACTNESS

The Ideal in passing out of the bare image of its essential form into external or determinate existence secures for itself a reality which presents two distinct aspects. From one point of view we see that a work of art discloses necessarily in the content of the Ideal the concrete semblance of reality, that is to say it presents that content as a definite situation or particular circumstance, action, event or character, and presents it moreover in the mode of external existence. From another it is equally obvious that art makes some specific and sensuous material the vehicle of the particular content in its entirety of all that we have above summarized; it creates in short a new world sensible to eye and ear, the world of art. Under both these aspects we may further observe that art penetrates to the remotest limits of externality which are compatible with its form as the self-including unity of the Ideal and conformable to its appearance as a concrete whole permeated with the energy of spirit[369]. A work of art moreover itself may, as an object qualified by externality, be viewed in two distinct ways. We may regard it

simply as an external thing, and as such only conformable to a unity that is external in the sense external objects are such. In considering it from this latter point of view we have once more to consider that relation of externality which we found it necessary to discuss in our examination of the beauty of Nature. And for this reason we shall again have to make use of those specific determinants which we previously discussed, and even then primarily in their connection with art. The modes under which external form was in the previous section exhaustively considered were then treated in a twofold way. First we analysed such conceptions as uniformity, symmetry, and conformity to rule; we then examined unity itself regarded as the simplicity and purity of the sensuous material, which art makes use of as the external medium for the existence of her expositions.

(*a*) We will start our inquiry by examining the position in which we now find ourselves relatively to such conceptions as uniformity and symmetry. It is obvious that these, expressing as they do the entirely lifeless unity of the geometrical logic, can by no means exhaust the nature of a work of art even when entirely regarded as an external object. Such determinations are only exhaustive in their relation to what is in itself lifeless, such as time and the configuration of space. Confined in this way though they be to the barest forms of externality, they are then true witnesses both to the power and substance of reason. And consequently we find they assert themselves in a twofold manner even in art. In the first of these, it is this very quality of their abstractness which operates by way of contrast to the living pulse of art, which is forced even in the confines of its sensuous material to raise itself over and beyond mere symmetry into the freedom of the Ideal. In this process of liberation which may be exemplified in the melodies of the art of music we do not, however, find that the conformity to rule disappears altogether, it is merely made subservient as a foundation. In the second, this principle of measure and rule in its application to the indefinite and

unlimited is the one and only qualifying principle which certain arts can accept owing to the nature of the media which those arts make use of. In such cases uniformity is itself and alone raised to the ideal significance of the art. The principal example of an art of this type is that of architecture; and the reason of this is that a work of art which is wholly architectonic is directed to the one object of reconstituting, by means of an artistic form, that which is essentially the external and inorganic environment of spirit. In this art, consequently, all that is rectilinear, right-angled, circular, or presents uniformity of pillars, windows, arches, piers, vaults, and so forth is the dominant principle of unity.

The artistic structure of architecture is not erected entirely as an object in itself, but rather as an external frame, embellishment and local habitation for something else which it subserves. A building is not complete until it has received the statue of the god or the society of human beings who make their dwelling therein. An artistic work of this kind should not therefore receive all or indeed the main attention. Holding this in our minds, it will appear obviously to the purpose that uniformity and symmetry should be here the prevailing characteristic of the structure; the mind passes over very readily one that is throughout uniform, and will not trouble itself about it for any length of time. Of course, we cannot here discuss the symbolical significance, which, in addition to that above examined, may attach to architectural form in its immediate relation to the spiritual content it envelops and emphasizes with a positive localization. The same principle applies to the art of making gardens, which we may define as a specific mode of architecture, in so far at least as an artistic conformation is imposed on external Nature[370]. In the garden no less than in the building man himself is the main object. There are two distinct types in this art of garden-construction. The one adopts as its main principle uniformity and symmetry; the other those of variety and irregularity. As an artistic product

the former is to be preferred. Labyrinths, however numerous and intricate, garden-beds in endless alternation of spiral lines, bridges over water usually stagnant, with every conceivable surprise that gothic church, temples, Chinese pagodas, hermitages, urns, summer-houses, mounds, statues may claim to afford us — one glance and only one glance at such things is sufficient, the vulgar and artificial pretensions of it all is too patent, and we do not seek for another. It is quite another matter when we cross any actual situation of real natural beauty, which has not at least been exploited expressly for our enjoyment[371], and by its own exceptional merit makes an irresistible appeal to our love of Nature and our sense of her beauty. A garden laid out with strict reference to the other extreme of regularity, makes no such attempts at surprises, but permits human beings to appear as the principal object in the external framework of natural beauty[372]. And this is really what a garden should be. Again in the art of painting the principle of uniformity and symmetry is clearly visible in the co-ordination of the whole, the grouping of the figures, their place and pose in the composition. But inasmuch as in painting the animation of life can assert itself through objects in a far profounder degree than is possible in architecture we find that it presents much less scope for the purely formal unity of the symmetrical, and the rule of uniformity in all its severity is for the most part to be traced only as the fundamental principle of composition in the earliest phases of art, making way in its more advanced forms to the freer line, which is associated in our minds with organic form rather than such we meet with in the pyramid and similar geometrical shapes. Conformity to rule and symmetry are further important factors in the composition of music and poetry. Owing to the incident of duration in the length of tones we find in these arts an aspect of what is intrinsically a purely external relation, which is incompatible with any other more concrete mode of presentation. If we take the spatial condition it is obvious that here everything which lies

in juxtaposition can be seen at a glance. It is otherwise with that which occurs in Time. Here we have merely a succession of moments, every one of which takes the place of another, and in this vanishing procession they flow on for ever. And it is precisely this indeterminacy which it is the function of musical time or beat to inform by adding thereto a real definition capable of uniform repetition. In this way the indefinite progression is subordinated to a rational principle. In musical time we have a power which exerts such a fascination upon us, that, so far from being able to treat it with indifference, we not unfrequently find ourselves beating time quite unconsciously with it while listening. This constant recurrence of equal lengths of time according to a definite measure has nothing to do with tones and their duration as we find them in Nature. Tone simply as musical sound and time abstractly regarded, are both of them equally indifferent to such uniform divisions and repetitions. Musical time is consequently something wholly created by the human mind; and indeed there is more than a suggestion of this in the fact that in listening to musical time we are at once impressed with the conviction, that we have, in this control of time according to fixed rule, nothing less than a real reflection of our spiritual nature, or rather that of the fundamental truth of self-identity, an illustration absolutely precise of the way in which the subject of consciousness applies this very principle of uniformity, unity with itself, that is to say, in constant recurrence, throughout all the variety and most intricate multiplicity of experience. And it is for this reason that the beat of musical time meets with such a startling response in the very depths of our being, gripping hold, as it does, of that self-identity, which is the fundamental abstract principle of our inmost life. Considered in this relation it is not; the spiritual content, not the concrete soul of our emotions, any more than it is the musical tone as tone, which appeals to us so intimately; it is simply the formal unity which the unity of consciousness transfers to the temporal process, and which is thus

re-echoed back to our conscious life. And the same remarks apply to the measure and rhyme of poetry. The sensuous medium is here, too, in the same way carried out of the sphere of that which is external to ourselves, and at once asserts there the presence of something over and above that which is expressed by our ordinary consciousness, which in its general use treats the time-divisions of tones with indifference or caprice.

A uniformity of similar character, if not so consistently defined, may be traced still further, and is involved in the living content of poetry itself, although the relation here is quite an external one. By this we mean that in an epic poem or a drama, both of which have their particular subdivisions, cantos, or acts, whatever may be the specific term applicable, there is an approximate principle of equality apparent in the division of subject-matter. And the same characteristic is generally true in the grouping of the subject in pictures, although such should not appear to be a necessary result of the nature of the subject-matter itself, nor create the impression that this uniform distribution is due to any controlling principle of first importance.

Conformity to rule and symmetry, which are the abstract unity and definition of all that is essentially spatial and its configuration no less than of all which is external under temporal condition, are mainly the co-ordinating principles of quantity and size, as we have already noticed in our consideration of the beauty of Nature. All that which does not, in virtue of its own specific medium[373], strictly form part of external extension, is consequently freed from the range of those principles which assert themselves exclusively in the relations of quantity, and are determined through relations of deeper significance, and the unity which co-ordinates them. It follows from this that the further art embraces subject-matter which is independent of the external condition, so much the less significant the principle of uniformity becomes, in the co-ordination of that art's subject-matter and the more completely is it restricted to a subordinate position.

It will be, perhaps, advisable here to close the above discussion of symmetry with a few general observations upon *harmony*. The relation of harmony is no longer one to mere quantity, but rather one to essential distinctions of *quality*, differences of tone, that is to say, which do not persist against each other in their native opposition, but as harmony or music have to be brought into concord. In music we find that the relation of the tonic to the mediant and dominant notes of the scale is no relation of bare quantity[374], but implies the presence of tones whose difference is *essentially* a qualitative difference; which, that is to say, combine naturally in a unity, rather than continue to assert their distinguishing *timbre* in all its glaring antithesis and contradiction. The true discord, on the contrary, requires its harmonic resolution. The same qualitative consistency is to be found in the harmony of colour, in reference to which it is likewise one of the requirements of art that it should neither manifest itself in a picture as a motley and haphazard juxtaposition of pigments, nor as a neutral surface whereon all fundamental distinction is dissolved[375], but as the artistic expression of a whole in which essential contrast is mediated through some principle of harmonious unity. Furthermore, we observe that harmony contains in itself a definite number of contrasted differences, which have naturally a particular significance of their own. Thus we find under the differentiation of colour a definite number known as the cardinal colours, which are primary derivatives of the fundamental notion of colour, and are not due to accidental composition. Harmony consists in bringing together a number of positive colours such as this classification implies, and uniting them in concordant unity. We must, that is to say, have in a picture not merely all the primary colours, yellow, blue, green, and red present, but also a harmonious scheme under which they are related; and the old masters have, without direct consciousness of the principle involved, paid express attention to this completeness of effect and arrived at artistic results which

flowed out of it. And furthermore, for the very reason that we find in harmony the beginnings of a release from the bare condition of externality it is duly qualified to absorb and express a spiritual content of wider significance. We may mark an illustration of this in the way the old masters distinguished between the drapery of their principal figures and of those of less importance, painting that of the former in elementary colours of absolute purity, but only conceding to that of the rest compound varieties. The mantle of the Virgin Mary is almost always blue; blue in its assuaging sense of tranquillity is accepted as the counterfeit of the repose and tenderness of the heart. It is only rarely that we find her in a drapery of emphatic red.

(*b*) The second aspect of externality is the relation it occupies directly in the various material which art employs in the various media of its presentations. The unity here consists in the clear definition and homogeneousness of the material, which ought not to deviate in the direction of a vague characterization and mere confusion, or, speaking generally, give us the impression of dirtiness. This determinacy is also entirely dependent upon the spatial condition, that is to say, upon the purity of its delineation, the distinctness of its rectilinear and circular lines, and so on, no less than upon a consistent definition of Time such as we find in the accurate measure of the musical beat. It depends furthermore on the translucency both of specific tones and colours. In a good picture we shall find that there is nothing unclean or "dirty"[376] in the colours employed, but everything is clear and asserts itself openly for what it is. The directness of its purity is, in fact, that which constitutes the lovely impression of colour upon our sense; and those colours which are most direct in their simplicity, such as a yellow which has no dash of green in it, or a red that is wholly independent of blue or yellow, produce the most emphatic effect. On the other hand, it is obviously more difficult to maintain a harmony of the

whole when colours are thus contrasted in all their pristine simplicity. Yet in despite of this these essentially simple colours form the foundation of every true colour scheme, and although it may be impossible to dispense with a considerable use of their compounds, even these should not be allowed to appear in one dead and dull interfusion, but with their simple and luminous derivations shining through them[377]; otherwise instead of the clear lambency of colour we shall get nothing but a muddy residuum. We shall find that the same thing is necessary in the *timbre* of musical tone. In the case of strings whether of metal or catgut it is the vibration of the material, and, moreover, of a material of definite tension and length, which educes the musical note. If the tension is insufficient, or the length of the string which is struck is not the right one, the tone inevitably loses its clearness of definition, rings false, as we say, owing to the interfusion with it of other tones[378]. We have the same kind of result when a purely mechanical fretting or scraping is suffered to interfere with the purity of the vibratory motion, and so to render the emitted sound confused and harsh. In the same way, it is of the first importance to the art of singing that the human voice should be produced from throat and chest freely and with purest intonation; the voice should be heard without the least indication of its organic instrument, or, as in the case of hoarseness, with an obstructive accompaniment the singer fails to repress. We may conclude, then, that this translucency and purity, free from all admixture with anything foreign to it, and consistent throughout in its clearness, is that which creates the beauty of tone as immediately apprehended by our senses, and which distinguishes it from every kind of mere noise. And we may add further it is this which in human speech conspicuously applies to the articulation of the vowels. A language which enunciates the five vowels with distinction and purity, as is strongly the case in the Italian, is essentially musical and adapted to song. The diphthongs, on the contrary, always produce a confused tone. In literature

little attention is paid to the direct reproduction of folk-dialects; we find them rather reduced to the simplest form of expression. In actual speech, however, this clearness of intonation only too often entirely disappears, so that we find, and markedly so in the case of dialects such as the South German, Swabian, and Swiss, men actually speak with an articulation of sound it is quite impossible to write down. We do not regard this, however, to be necessarily a defect in human speech, but rather a reflection of the rawness of the common folk. And here we must close our observations upon that external aspect of art, which, from the fact that it is external, and nothing more, is only capable of receiving an external and abstract unity.

Now according to its more comprehensive definition it is the *concrete individuality* of the Ideal impregnated with reason, which takes to itself externality as the form of its embodiment, and, moreover, in such a way that the external semblance, which is thus the medium of its expression, is throughout suffused with the mind inherent in this concrete individual form. In consequence of this such modes of relation as uniformity, symmetry, and harmony, or, in other words, the more simple determinations of the sensuous material are no longer adequate. This defect naturally extends our inquiry to that second aspect of the external determination of the Ideal already stated.

2. THE COALESCENCE OF THE CONCRETE IDEAL WITH ITS EXTERNAL REALITY

The fundamental truth which we shall endeavour to substantiate before everything in the matter which now immediately engages our attention is this, that man is under an obligation to make himself at peace and at home in the environment of the world; or, to put it rather differently, his individuality must live itself into Nature and all the conditions of that external world, and by doing so assert its freedom visibly. And, moreover,

this must take place in such a way that these two related factors, that is, on the one side, the entirety of his inward life and the character it possesses or displays in all conditions or actions whatsoever, and, on the other, that objective entirety of external existence which confronts him, must wholly lose the appearance of two worlds which are either indifferent to or not homogeneous with[379] each other, and forthwith proclaim themselves as harmoniously related and identical in substance. This externally objective world must, in so far as it is the reality of the Ideal, surrender the semblance of its own objective self-subsistency and stubbornness, in order that its fundamental unity with that to which it supplies the external and particular embodiment may be exhibited in truth.

To establish this unity with more conclusiveness we propose now to examine our subject under three different heads of discussion.

First, we may investigate the same from the point of view that this unity which binds the two factors already defined is merely a bond which possesses *no positive reality*[380], but is merely a mysterious and secret connection both in its origin and appearance, by virtue of which our humanity is looped together with its environment.

Secondly, however, as a deduction from the fact that it is the concrete *spiritual* life of man and the individuality which pertains to it which constitutes the point of departure, or rather the essential content of the Ideal, we shall further examine this association, as in truth the creation of *human* activity itself and only possible as such a creation.

Finally, we shall prove that this unified world created by the human Spirit is itself a complete entirety, which, in the determinate form of its existence, is objectively valid, and in essential relation with which every unit of our common humanity who is actively engaged with the vital concerns of art must infallibly remain.

In opening our discussion of the position we proposed first we would at once point out an important conclusion involved in it. We have here posited that the environment of the Ideal is not directly due to human activity, it can therefore only be regarded in this first step of our inquiry as something external to man, that is to say Nature. How, then, is this something outside man to be exhibited in the ideal work of art? We will discuss this at least in its more general terms, and here, too, draw attention to three aspects of importance.

(α) In the first place external Nature, so far as the reproduction of its external form is concerned, is in every respect a reality which is embodied in some *definite* shape. If our representation is in every respect to satisfy really all that is implied in this condition it must be the exact counterpart of the phenomenal truth of Nature. We have, however, already drawn attention to material points of difference between the truth of Nature and its reproduction by art which cannot be disregarded. We may, however, observe that it is an almost universal characteristic of the great masters that they are conspicuously true in their delineation and elaboration of the broad facts of Nature. And this is not so much due to a love of imitation as it is due to the fact that Nature is not merely in a general way the objective facts of a heaven and an Earth with humanity suspended, as it were, in a *vacuo* between them; but rather that the emotional life and activity of man can only be rightly conceived as alive and operative in a given place with all its associations of streams, rivers, hills, mountains, plains, dales, and forests. Take the case, for example, of Homer, who is not at all a poet of the picturesque in natural scenery as we now understand it; we shall, nevertheless, find even in him the descriptions and indications he gives us of actual places or natural features such as the rivers Scamander or Simois, the coast and bays of the sea and so forth correspond with such truth to Nature that geographical investigators only quite recently have been able to

map out the locality to which he refers in entire accordance with his descriptions. The ballad-singers of the Middle Ages present a sordid[381] contrast to him in this respect, no less than in their power of depicting character; the effect of their productions either way is bald, jejune and nebulous. Even in the case of the Meistersingers, though they versify old biblical stories which they locate in Jerusalem and elsewhere, it is little more than the bare names which we get. In the Book of heroes[382] the effect is precisely similar. Otnith rides through the pine-forest, fights with the dragon, but it is no world of men or distinct locality we can recognize, and our imagination is consequently in this respect left without any support. Even in the Nibelungenlied there is no real increase of local interest. It is true the names of Worms, the Rhine, and the Danube are mentioned; but practically all further detail is omitted and the result is as barren as before. And yet it is clearly through this very clearness of definition that our narration becomes individual and real; without this it is a mere abstraction which directly gives the lie to the concrete reality it proposes to present.

(β) In addition to these fundamental requirements of clear definition and correspondence with the natural facts a certain elaboration of detail will frequently much assist us in presenting the external aspects of a picture which our perception or imagination can readily seize. Unquestionably, owing to the nature of the particular medium in which the several arts express themselves, there will be a marked difference of range to which, in any particular case, this process may be carried. If we take the art of sculpture, for example, we shall find that the repose and universality, which are the fundamental features of its characterization, are less consistent with this elaboration of external detail than is the case in some other arts. Externality is here neither defined as a particular place nor a particular environment, but is entirely concentrated upon such details as drapery, arrangement of hair, dress, weapons of war, mode of seat and the like. Nay

more, the actual definition of many figures in antique sculpture is only obtained through an entirely conventional arrangement of drapery or hair, or other distinguishing accessories. This is not, however, the place to discuss further the significance of the conventional. It is obviously outside the sphere of natural fact and rather related to the contingent; or, to put the matter in this particular case more fully, it is the means through which we arrive at that which is more universal and persistent in our final artistic effect.

As a reverse case to that of sculpture the subject-matter of lyrical poetry is pre-eminently man's emotional life; for this reason it is not so necessary in this type of poetry to lay stress on the detail of actual facts even when reference is made to the external world. It is, on the other hand, part of the function of epic poetry to state events as actual facts, to be precise as to the place where actions occurred and in what manner they were performed; and, in short, of all types of poetry it is the one to which the widest latitude and the closest accuracy of local detail is most essential. And, furthermore, if we contrast all the arts together in this respect we shall find that not one of them is, by virtue of its medium[383], so exclusively occupied with the detail of external Nature as that of painting. At the same time we must add a word that applies equally to all of them. Whatever the definition of Nature may be, it never ought to give the erroneous impression of Nature's prose reality, that is to say, as the immediate imitation of such; nor should that fulness of detail, which is devoted to the spiritual aspect of individual life and its events, be carried by enthusiasm out of the due relation of its importance to the whole. And generally we may affirm of both that such exclusive definition ought not to be all that is anywhere presented, inasmuch as everywhere in a work of art that which is a natural fact should only receive its artistic embodiment in close relation to man's spiritual life.

(*γ*) We have here struck the very note we wish particularly to emphasize. We have already remarked that there are two essential conditions to any effective presentation of a real personality; we must have before us both the reflection of the man's inner life and the natural environment which surrounds him. And in order that this external surrounding appear as one that is truly his own an essential bond of relation must be established between him and it, one which to a greater or less degree is part of his own spiritual substance, where we may, doubtless, cross many traces of contingent matter and yet find the spiritual bed of this nexus still maintained. Throughout the entire spiritual *apparatus* of the heroes of Epic poetry, for example, their mode of life, that is, opinions, emotions, and all that they do we ought to be able to recognize a subtle homogeneousness, a harmonious *en rapport*, which fuses the two aspects of such a life into one concordant whole. The Arab is thus united with Nature, and, indeed, apart from his sky, his stars, his torrid deserts, his tents, his camels, and his horses is unintelligible. He is only truly himself and at home under such conditions. In the same way the heroes of Ossian possess in the highest degree an intense inward life; but in their very gloominess and melancholy they appear as the genuine growth of their hills of heather, whose thistles are swept by the wind, of their rain-clouds, mists, mountains, and dark caves. The physiognomy of the conditions under which they live reveals to us as nothing else can the secret of that inner life of emotion which is lived through with all its sadness, mourning, its pains, its battles, and its mist-like apparitions in such a natural setting; they are, in short, entirely at home in it and in it alone.

Such considerations supply us with ample ground for the statement we let fall previously unsupported that the subject-matter of history offers unrivalled opportunities for perfecting this intimate relation between the two aspects of human life we have been discussing, and enabling, us to

carry the same directly into the minutest particulars. Very rarely, indeed, are we likely to find that the imagination can simply through its own initiative create such a harmony, although we ought to feel its presence throughout, however little it may, in fact, have produced of the raw material it combines into artistic completeness. No doubt there is a common tendency to rate what we fancy is the free creation of imaginative genius above the effort of assimilating in artistic form a material which is borrowed; but it is for all that quite impossible that the imagination should alone create that harmonious *entente*, the unity of the Ideal requires in the consistent and defined form which lies before us in actual existence, where national traits, to cite the examples above, are the veritable growth of such a harmony.

And here we close our consideration of the principle accordant with which we have rendered more clear that aspect of the unity of the inner life with its natural environment which we posited as secret or potential, not at any rate directly due to human activity.

(*b*) The second phase of this harmonious relation may be explained more positively, being expressly due to man's own activity and his adaptation of means to ends. For man adapts external objects to his own uses and, by means of the satisfaction which his work supplies, places himself in a harmonious relation to them. In contrast therefore to our first indefinite[384], and, in fact, entirely general type of harmonious association the present one is directly concerned with what is particular, as exemplified in the particular needs of man and their satisfaction by his converting to his use such natural objects as he may require. The range of his wants and the consequent impulse of their satisfaction is of a practically unlimited variety; yet it is nothing in comparison with the variety of Nature herself. Simplification is therefore inseparable from the task whereby, our humanity imposes on the facts of Nature its own vital purposes, and interpenetrates the external world with its own volitions. In this way man's environment is humanized; he

proves by his own acts that it is capable of satisfying his nature and is unable to preserve any predominant independence over against him. Here at last, by virtue, that is, of his own productive exertions, we find him no longer in a merely general sense of the term, but actually in every detail of his particular surroundings a real centre of his own substance and at home.

The fundamental conception which it is most important to emphasize as that which affects art throughout in its relation to all we have above considered may be thus stated. If we look closely at the relative position man occupies in all the infinite variety of his material wants, desires, and aims, we shall find that it is not one merely of *general* significance, but one of actual *dependence*. The absence of freedom implied in this relative position is antagonistic to the Ideal; and in order that man may become a suitable object for art, he must have already released himself from the travail of this enforced condition, and thrown off the chains of his dependence. Moreover, this act of mutual accommodation, when we trace it to its origin, may strike us in one of two different ways. Either he may conclude that Nature in all friendliness on her own part supplies man with what he needs, and so far from throwing obstacles in the path of his interests and objects, rather freely gives them him as one who meets him half way wherever he goes. Or, on the contrary, we shall not fail to observe that our humanity has wants and desires, whose immediate satisfaction Nature is quite unable to secure. In cases that fall under the second type it is obvious that man can only work out the self-satisfaction vital to him through his own energies; he must take possession of that which Nature possesses, set to rights the defects which appear, modify their form, removing all that stands in his way with adroitness; and, in short, convert Nature's raw material into means through which he will be able to attain all that he proposes. The relation in which the unity between man and his environment will be most conspicuous must be sought for in an example,

where there is already a real contact between them, where, that is to say, human ability is on such good terms with the amenability of Nature that all the severity of a conflict between them as unreconciled forces disappears, and we have forthwith the completed symphony under our eyes.

For the reasons, then, already advanced the ideal province of art must be held secure from the bare necessities of life. Property and the favour of circumstances, in so far as they supply a condition, under which poverty and labour vanish not merely for this or that hour, but for the most part altogether, are for this reason, we will not say incompatible with art, but rather in full concurrence with the Ideal. Yet it would only betray a real lack of comprehension[385], if in cases where the conditions of our art compelled us to consider the facts of life in all their multifold variety, we nevertheless omitted from our composition all reference to the relation in which human life is placed to these very natural constraints. It is true enough that such are purely finite conditions; but art is not therefore able to dispense with them. They must not, in fact, even be treated by her as something merely bad. It is rather her function to reconcile them with the Real in her embracing unity. And indeed the finest actions and opinions which she reflects on her mirror, if we consider the particular form of the determination and content alone[386], are necessarily limited and consequently finite. That I find it necessary to provide myself with nourishment, food and drink, a house to live in, and clothing to wear, seats to sit upon, and everything else incidental to domestic life is no doubt an inevitable concomitant of the fact that I live in the world; but the life that only I myself experience within me permeates, this external aspect of my life so completely, that men are fain to clothe and arm the very gods themselves, and to picture them under conditions inseparable from a variety of things they seek to possess, and find their satisfaction in obtaining. In short, for art to be possible, this satisfaction of the necessities of life must be assured to us. Or to take an example where

this is not so, there is that of adventurous knights who only secure their immunity from external hardship through the continued success of their enterprise, which is therefore itself but a contingency, in much the same way as the prosperity of savages is contingent upon the amenities of Nature. The conditions in both cases are not favourable to Art. Her true Ideal is not merely to be found where our humanity is barely lifted above the most rigorous condition of dependence upon the smiles or frowns of Nature, but is most of all at home in that superfluity which suffers it in conjunction with Nature's bounty to expatiate with freedom no less than delight.

The above remarks are obviously of very general application. Two considerations, however, of a somewhat more restricted interest may be deduced from them.

(α) The first of these relates to the kind of use to which mankind put the objects of Nature in seeking for a satisfaction which is wholly *aesthetic*, or due to some habit of the mind. Everything in the nature of ornament and finery, or, in general terms, everything that men convert to their use for the sake of mere show comes under this head. And the point to which we draw attention is this, that when we find men thus decorating themselves no less than their immediate surroundings, we ought not so much to conclude that all that they thus collect together from Nature's most costly and beautiful storehouse, whatever may most attract their eyes in the same — whether it be gold, precious stones, pearls, ivory, or precious raiment — that all this unrivalled rarity and brilliancy, in short, is that which for its own sake, and primarily as a product of Nature, interests them: rather their interest in it all is essentially personal as a thing suitable for the houses they live in, or for that which they most love and honour, whether it be their rulers, their temples, or their gods. A man selects in this way that which already appears to him as externally beautiful, pure translucent colour, glitter of metals, fragrant woods, marble, and all the rest. Poetry, and particularly Oriental

poetry, makes a willing use of such wealth, a fact we may even illustrate from such a poem as the Nibelungenlied: and generally it is true enough that Art in such matters is not merely content with a general description of the beauty or value of such fine things; but, where the artistic form and the occasion allows, will describe such works in all the detail of their workmanship with as royal a bounty as the works themselves. There was no stint of either gold or ivory on the statue of Pallas at Athens, or that of Zeus at Olympia; and the temples of the ancient gods, the churches of Christendom, the pictures of saints, and the palaces of kings, are notable illustrations among all nations that possess any of them, to what kind of service splendour and brilliant show may be devoted; thus have nations in every age delighted in seeing upon their gods the visible presence of their own wealth, precisely as they have found delight in the splendour of their princes as a glory they still possessed, though ravished from themselves.

We all know, of course, that type of moralist who is only too ready to disturb the vision of such an enjoyment. We shall, no doubt, be reminded how many poor Athenians the aegis of Pallas could have supplied with a hearty meal, or how many slaves could have thus been liberated; and, doubtless, we must admit that in the case of the ancient world, no less than in days more near to our own wealth, all that has been lavished on temple, cloister, or cathedral, or other objects of public utility, has been expended under social conditions of the direst need to many. Nay, we may carry such melancholy reflections yet further, and find in them a condemnation not merely of particular works of art, but of Art herself and all that she gives us. What sums of money are involved in the building by the State of an Academy of Arts, or the purchase of ancient and modern works of art, and the appropriate embellishment of public galleries, theatres, and museums! But whatever the effect of such reflections may be upon us, whether ethical or otherwise, such is, after all, only due to the fact that we are once more

reminded of those very constraints and hardships whose removal is a vital condition of the appearance of Fine Art. The appropriation of a unique sphere in its life for the exposition of its artistic treasures, which stands safe above the stress of that reality to which it contributes so largely, can therefore only redound to the glory and supreme honour of any people.

(β) But, further, mankind is not merely interested in the adornment of individuals and the environment of their life, but is actively employed in adapting the objects of Nature to its practical needs and purposes. It is on this plane that we come into contact for the first time with all the labour and struggle which the dependence of our humanity upon the prose of its finite life implies. And the question inevitably arises, how far all that is involved in this practical effort is suitable to artistic presentation.

($\alpha\alpha$) In attempting some answer to this problem, we would draw attention to the historical fact that the earliest way in which Art attempted to banish all the prose reality of human life was the conception of the well-known golden age or, if we care to call it so, the idyllic state. In this we have Nature depicted as satisfying man's every want with no trouble to himself: while he, for his part, enjoys in a state of innocence all that mead, wood, flocks, garden, shelter, and so forth, can supply him with nourishment, dwelling, and all other comforts incidental to such a life. Of the passions of ambition or avarice, indeed of every impulse that may appear to run counter to the nobility of man's spiritual nature, we hear no word at all. At first blush, no doubt, a state of this description may strike us more or less as ideal, and certain types of art, limited in their range, may find definite satisfaction in presenting us with a picture of it. But we have only to penetrate further below the surface and we shall quickly have enough of such a vision. The writings of Gessner are little read nowadays, and when we do read them we find in such little satisfaction. The truth is that a restricted state of life, such as the above described, presupposes a

very elementary stage in human development. Manhood which has attained to any real fulness of spiritual stature is moved by impulses of loftier range, and is not likely to be satisfied with the life which clings closest to Nature and its immediate products. In such idyllic poverty of soul no man ought to live, but rather to accept his birthright of toil: that which his spiritual impulse urges him forward to, that he must secure through his own activity. Once regard the matter in this way and these very physical wants of man will be found to bring into being a wide and diverse range of activities, implanting in him the conscious sense of his own powers, from the heart of which the profounder interests and forces of his life can slowly unravel themselves. But, at the same time, it is necessary that here, too, the harmonious relation between the outward and inner life should be maintained as the fundamental principle of artistic presentation. Few things are more offensive to our aesthetic taste than to find in a work of art the severity of some physical disaster portrayed through every detail of horror. Dante flashes on us the starvation of Ugolino in a few trenchant strokes. When a Gerstenberg, in his tragedy of Ugolino, wrings out every detail of the catastrophe to the last drop, telling us precisely how first Ugolino's two sons, and after them their father, were done to death by starvation, we feel at once that the subject, as thus handled, is entirely at variance with the principles of fine art.

(*ββ*) We shall, however, find that the condition of life which offers the strongest contrast to that we have described as the idyllic state, we will call it the generally civilized life[387], presents, though on other grounds, difficulties to an ideal exposition which are equally serious. In a Culture-State the complexus of social wants and labour, of interests and all that may go to satisfying the same, is throughout and in all its comprehensiveness completely evolved. Every individual here is immersed in an infinite network of relations with other units of the whole, and with so much loss to

his complete independence. What he himself requires for himself is either nothing at all, or only, in a quite insignificant fraction of it, the result of his own labour: add to this the tendency of all a man's normal activities is to become more and more mechanical. We find, too, at the heart of this industrial development and the interchange of employment and rejection of human labour which it implies, on the one hand the most ruthless conditions of poverty, and on the other a class which, raised as it is above the bare necessities of existence, stands out in relief as wealthy, entirely released from all toil for the sake of a subsistence, able at any rate to devote individual attention to the finer interests of life and its pathetic contrasts. No doubt the possession of such a superfluity may create an impression as though for the favoured few the constant recurrence of a position of dependence had passed away, and a man is just so much the more released from the accidents incidental to property because his hands are at length free from the grime which soils them in securing it. But such a consolatory reflection will never make a man thoroughly at home in all that immediately surrounds him in the real sense that such is the garland of his own labour. For he is the centre of that to the upraising of which he has not himself been instrumental; it has come there out of that provision store which was already full without him, which quite other persons and for the most part in a quite mechanical and, therefore, formal way have provided, and to which he is only introduced after a long series of effort and struggle wholly strange to himself.

(*γγ*) We are consequently led to the conclusion that it is rather a *third* type of human society, a society which we may place halfway between the idyllic golden age and the burgher State in its fully developed industrial form, which is most fitted to be the subject matter of ideal art. We have already analysed this state of society in another connection under the description of the *heroic* and pre-eminently ideal world-condition. The

heroic age is no longer restricted to that idyllic garden of spiritual attenuation, but includes within its borders passions and aims of deeper moment; and yet withal that which in the circle of the individual life touches closest the satisfaction of each man's immediate wants is still the entire product of his own activity.

Moreover, the means of nourishment such as honey, milk, and wine are less complex and consequently lend themselves more readily to ideal treatment[388]. A diet which includes coffee, brandy, and such like luxuries is associated in our minds with countless industries which are necessary to their preparation. Our heroes, on the contrary, kill and roast their own food, break in their own chargers, are the makers to a considerable extent of all their household gods; ploughs, armour for defence, shields, coats of mail, swords, spears, all are either the work of the possessor, or are made directly under his supervision. In a condition of life of this kind a man necessarily feels that in all the things he makes use of, and in all that encircles him, he is in touch with something produced by himself; that in contact with external objects he is in contact with his own substance rather than with objects which emanate from a world strange to himself and outside that in which he is himself master. It is, of course, assumed that all the energy he expends upon working up the material into forms adapted for his use is not so much troublesome labour, but a work which, through the satisfaction it brings him, falls easy from his shoulders, a work, in short, which he can carry over every obstacle to success.

We find a society of this type in Homer. Agamemnon's sceptre is a family staff which his ancestor himself shaped from the block and left as an heirloom to his descendants. Odysseus put together with his own hands the mighty bed he shared with Penelope; and if the famous weapons of Achilles are no work of his own we only find the various and interfused array of his own activities abated that a god, Hephaestus himself, may provide them at

the request of his mother Thetis. In a word, we meet everywhere the youthful delight in novel discovery, the freshness of personal possession, the victorious sense of enjoyment. Everything is in its place and at home, in everything a man discovers the energy of his own sinew, the adroitness of his own hand, the cunning of his own spirit, or somewhat that follows from his own courage and bravery. In this way, and by this alone, the instruments which satisfy our human sense are not as yet relegated to a merely external relation, but men have before them the living process of the instruments themselves, the vital consciousness of the human worth they attach to them; and they find it there inasmuch as for them they are not mere lifeless things or things which habit has made lifeless, but creations impregnated with their own energies. And for the same reason we find here an idyllic condition of things, it is true, but not in that restricted sense of the term that the Earth and her streams, seas, forests, and cattle supply to mankind their sustaining substance, while man himself is only visible to us as a passive creature limited by the active powers which support him and their enjoyment. Rather we already see within this morning-time of human life deep interests at work, in relation to which the great world itself is but a subordinate realm, the ground and the instrument for bringing into being the higher aims which are present, as a ground and environment, however, over which that harmonious concord, yet withal independence, of both sides of our human world prevails; and which does prevail in the sight of all for this reason that everything there exists as the product and for the use of human life, is at the same time the creation and enjoyment of the man who creates and enjoys its use[389].

To apply such a mode of artistic presentation to material borrowed from more recent times, whose completed culture offers the strongest contrast to the heroic age above-mentioned, is always beset with extreme difficulty and liable to failure. Yet for all that Goethe in his "Hermann and Dorothea" has

furnished us in this respect with an admirable masterpiece. Here an attempt will only be made to elucidate a few significant points by contrasting the same with a composition of similar type. Voss, in his famous romance "Louise," had depicted on much the same idyllic lines our human life and activity in a quiet circle of narrow range, if also marked with independent characteristics of its own. The country parson, the tobacco-pipe, the dressing-gown, the garden-bench, and finally our coffee-pot, have all of them here important parts to play. Coffee and sugar are, however, products, which are really here out of place; they belong to an entirely different world[390] throughout associated with all the varied ramifications of commercial and textile industries. This circle of country life is consequently not self-inclusive. In the beautiful picture of "Hermann and Dorothea" we are, on the contrary, under no necessity to demand such a consistency. As we already have pointed out in another connection, we find interwoven with the main threads of this poem, which is, no doubt, in its prevailing atmosphere entirely idyllic, the great political interests of the time, the struggles of the French Revolution, the defence of the Fatherland, asserted in a worthy way no less than with decision. The more limited scope of family life in a little country town is not so presented us as a whole which can even possibly remain in total ignorance of that mighty wave of the great world under stress of a real cataclysm of events, which is the view we are given of the pastor in the "Louise" of Voss. In Goethe's poem we have, on the contrary, by means of the interfusion of these great world-movements, within which the idyllic characters and events are portrayed, the picture of a life with a typical character of its own set in the frame of a world of more significant content; and the apothecary, who is here presented as the out-and-out Philistine, and who merely lives within the more narrow borders of that country life's surroundings, affected by that only, is excellently sketched for us with the good heart, but at the same time peevish isolation,

which we find so natural. Add to this, in that which most closely touches the life of the characters thus portrayed, we find a particular emphasis laid on the fundamental aspect of this idyllic life as previously indicated in our former discussion of it. To mention one point only, we may observe that the host does not by any means drink coffee with his guests, the parson and the apothecary; on the contrary, to cite a line or two:

Carefully brought in the mother the sparkling and glorious red-wine,
Poured in the clear-cut glasses, with rimlets all polished of pewter,
Brought in the green-coloured rummers, those goblets most fit for the Rhine-wine.

They drink in the fresh air what has been grown at home, of the '83 vintage, and withal in glasses that, as home-made, are just the right ones for Rhine-wine. A few lines further on our fancy is yet further kindled with the "streams of the Rhine river and its dearly-loved banks," and we are even introduced to the vineyard of the host behind the house itself; and, in short, there is nothing to arrest our attention outside the typical circle of a self-contented life which of its own bounty provides for its wants.

(*c*) In addition to both these types of human environment we must mention yet another in close association with which we all necessarily live. It is no other than the universally prevailing *spiritual* surroundings of our life whether they be religious, legal, or moral, the organization of the State, that is to say, the constitution of the government, the judicial institutions, the family, the institutions of both public and private life, and all other social relations. For the ideal character is not merely to be portrayed in its relation to all that satisfies material wants, but as itself a focus of spiritual interests. It is certainly true that all that is truly substantive, divine, and essentially necessary in all these relations is fundamentally an envisagement of one reality. In the objective world, however, the forms under which this

reality is manifested are various, and they are, one and all, involved in that which is wholly contingent in particular examples, and the conventional usages which are only valid for definite periods of time and distinct nations. In this variety of form all the interests of men's spiritual life receive an external embodiment of reality, with which every man is confronted in the customs, usages, and habits of society. Every man thereby, in addition to possessing a self-exclusive individuality of his own, becomes, in virtue of his association with such spiritual realities, even more a member of a whole cognate with and vital to himself than as a unit of that external world of Nature with which he is similarly conjoined. Speaking generally, we may attach to this spiritual association, of human life very much the same terms and significance we have already discussed in the foregoing sections; consequently we will for the present pass over the more detailed consideration of it, whose most important features will apply more strictly to another aspect of our inquiry, and will then be more appropriately discussed.

3. THE EXTERNALITY OF THE IDEAL WORK OF ART IN ITS RELATION TO A PUBLIC

It is therefore necessary that art, as the representation of the Ideal, must embody this Ideal in all the relations to external reality we have above described, and thereby associate the inward possessions of character with the objective world. A work of art, however much in form it may be a self-including and harmonious world by itself, exists none the less as such an object, both real and particular, not *for itself* but for such as *behold* and *enjoy* it, that is the Public. Actors, for example, in the representation they give us of a particular drama do not merely enter into converse with one another, but appeal directly to ourselves, their audience; and it is equally important that they make themselves intelligible under both these aspects. Every work of art is in fact a direct appeal to the intelligence of everyone

who confronts it. Now it is indeed true that the real Ideal, as envisaged for us in the universal interests and passions of its gods and men, is so far intelligible to everyone as it gives us a view of its characters within some typical external world of customs, usages, and everything else that characteristically distinguishes it. But the condition of art we have above formulated makes it further necessary that this element of external reality is not merely one with which the characters thereby represented are harmoniously associated, but must be also one within which we ourselves to whom the work is addressed feel equally at home. The appropriateness of the external environment to the characters enfolded within it must apply with equal force to our own attitude of mind in regarding both. But it so happens that from whatever period of the world's history the subject-matter of a work of art may be borrowed it will be sure to contain essential features, which are quite distinct from those which specifically determine other nations and periods. In other words artists of every description, whether they be poets, painters, sculptors, or musicians, select subject-matter from the Past, which in their particular state of culture and intelligence, ethical customs, usages, and the form of their government, differ from the civilization of the times they live in. Moreover, as we have already observed, this return upon the Past possesses the considerable advantage that in having thus recourse to memory instead of being face to face with all the facts of the present, there is an appreciable diminution of the material from which the artist selects his subject, and this he cannot readily dispense with. At the same time the artist belongs only to his own century, and it is in the ethical customs, modes of conception, and generally the intellectual outlook of that he lives. The Homeric poems Homer, to take him for once as the individual creator of both "Iliad" and "Odyssey," may have actually lived through or he may not; but in any case they are at least four hundred years later[391] than the time of the Trojan war; and further a

period twice as long separates the great Greek tragedians from the days of the ancient heroes, who, as translated into the atmosphere of their own time, form the subject-matter of their poetry. It is just the same in the case of the Niebelungenlied and the artist who finally fused together the various saga which that poem contains into one homogeneous work. We may no doubt admit that the artist finds himself entirely on congenial ground when dealing with everything truly pathetic, either in the history of gods or men; but the external and actual conditions of that ancient world, whose characters and actions he endeavours to portray, have altered in essential features and become consequently strange to him. And further than this a poet creates for the sake of a Public, and primarily for his own nation and his time, both of which should be able to enter into such a work of art with intelligence, and feel at home in it. The most genuine works of art no doubt assert a further claim to immortality, a hope that they may continue to be a source of delight to all times and nations. But even in the case of works of the highest class it is none the less true that nations and times situated far away from those which produced them can only fully apprehend them with the assistance of an extensive apparatus of geographical, historical, and it may be even philosophical knowledge and the results of much critical investigation.

Bearing in mind these fundamental, and to some extent incompatible differences which characterize the various points of view from which a work of art must be regarded, the question arises what kind of form relatively to its external framework of locality, custom, usage, and generally any and every condition of religious, political or ethical significance a particular work of art should receive. Should an artist suffer his own times to pass from his mind altogether, and attempt only to secure the substantial appearance of the Past and what actually then existed, so that his work become simply a true portrayal of that; or is he not merely justified, but

rather under an obligation, to pay an exclusive attention to his own nation and the life around him, elaborating his work with express regard to the principle that it should stand in harmonious relation to his own times? Or, to put the same thing in rather more technical language, we may propound the problem thus: Is the subject-matter of a work of art to be *objectively* valid in its content as one entirely appropriate historically considered, or should such matter be treated *subjectively*, that is, in complete subordination to the artist's personal standpoint relatively to the culture and social conditions of his own time? We would rather observe that both these positions, if thus pressed unduly, land us in extreme conclusions equally false; and we propose now to examine them briefly that we may by their means elucidate a more satisfactory theory.

And we would consider three fundamental aspects which this problem suggests. We will *first* examine what is implied in the above subjective assertion of the particular culture of the artist's own time; *secondly*, there is the question what may be regarded as exclusively and objectively true when we refer to the Past; *thirdly*, we have to consider what may still be objectively valid in the true sense, though we still have a representation and appropriation of material borrowed from a time and nationality foreign to that of the artists.

(*a*) Now to start with, if we consider this purely subjective assertion, it is obvious that when we press the position closely we are finally driven to exclude the objective embodiment of the Past altogether, and to maintain that artistic representation is exclusively concerned with the appearance of present times.

(*α*) Such a result may be doubtless, under one aspect of it, presented by mere ignorance of the Past. It is, then, rather the result of a *naïveté*, which is unable to feel the contradiction between the object itself and the representation given, or at least fails to bring the same to consciousness.

Such a form of artistic presentation is therefore fundamentally due to lack of sufficient culture. We could hardly wish for a more vivid illustration of this than we find in the *naïve* productions of Hans Sachs, who has, no doubt with a vivid freshness of imaginative vigour and spirit, as we may truly say, domesticated among us[392] our dear Lord and Father God no less than Adam, Eve, and the rest of the patriarchs. Here, for example, God the Father is portrayed as teaching a school in which Cain, Abel, and the rest of Adam's children — are the pupils, precisely as any pedagogue of the time might have done. He catechizes them upon the ten commandments and the Lord's Prayer. Abel knows his lesson as a pious and good boy ought to. Cain on the contrary behaves and replies to his teachers as only naughty and wicked boys would think of doing; and when it is his turn to repeat the commandments turns them inside out: thou shalt steal, thou shalt not honour thy father and mother, and so forth. A representation of much the same crude simplicity having for its subject the tale of our Lord's Passion used to be carried out in South Germany, was then made illegal, and has since once more been resuscitated. In this Pilate is portrayed in the character of an insolent, rough, and arrogant official, the common soldiers much in the same familiar way our own might, offer Christ surreptitiously a pinch of tobacco; he disdains it, and they flatten it out on his nose. Vulgarity finds all the more jest in such an incident for the reason that it wholly conforms to its notions of piety and reverence, indeed calls up such feelings all the more readily through its immediate reference to that which it finds in its own world, thereby making more vivid its own sense of devotional fervour. No doubt there is a certain justification for this mode of translating, so to speak, the appearance and form of objective history into modern equivalents, such as we have found in our literature; and we may even attach a kind of greatness to the courage of Hans Sachs in making himself so familiar with God Almighty, and those old religious ideas that without the least vestige of

impiety he could rivet them deep within the conditions of our most commonplace life. At the same time such an attempt is none the less a rude intrusion upon our feelings, and indicates lack of cultivation, inasmuch as it not merely disallows to the object itself a right to assert itself as it really is, but forces upon it a mode of appearance so directly contrary to that which it possesses, that the result can only impress us as an emphatic caricature.

(β) As an antithesis to the above type of subjectivity we find another equally supreme asserting itself out of sheer pride in its own culture under the belief that the views peculiar to its own times, its ethical customs, and social conventions are those alone worth preservation or acceptance. Owing to a bias of this kind it is quite unable to enjoy the content of a work of art until such a form of culture prevails in it. An illustration of this latter type is the so-called classical good taste of the French school. Everything that is here attempted must forthwith be Frenchified, and all that it presents under the form of any other nationality and more particularly with any reference to the Middle Ages is voted incorrect and barbarous and is cast on one side with absolute contempt. Voltaire expressed anything but the truth when he said that the French have improved the works of the ancient world. What they have done is to nationalize them; and by this process of recasting have corrupted them with every kind of foreign and angular quality of their own that such a taste as theirs could develop to any extent, requiring as it did throughout a culture absolutely based on court etiquette, and a conformity to conventional rule and generalization in both the meaning and mode of any dramatic work. Indeed, we shall find the trail of this abstraction of a superfine culture visible in the very diction of their poetry. Not a poet among them dare venture to use the word *cochon*, or add their own nomenclature to spoons, forks, and a thousand other simple objects. Consequently we have roundabout definitions and circumlocutions. We cannot have our spoons and forks; we get instead an instrument of the hand

which conveys our victuals in a liquid or arid state to the mouth; and this by no means stands alone. And with all its refinement their taste is vulgar to a degree; for the simple truth is that genuine art, so far from planing away and polishing its content to one flat and unruffled surface of generalities, is most of all anxious to set in full relief all that makes toward the well-defined characterization of life. It is on account of this very taste that the French can make less of Shakespeare than any other poet. And when they have attempted to work him up to their graces they have clipped off from him precisely that portion which we Germans find nearest to our hearts. For the same reason Voltaire makes merry over Pindar because he has made the remark, *ἄριστον μὲν ὕδωρ.*[393] And, consequently, in their works of art they find it necessary to make Chinese, Americans, or the heroes of Greek or Roman antiquity all speak in one tongue and in one manner — that of their French court. Achilles, for instance, in the "Iphigenie en Aulide"[394] is nothing more or less than a French prince; and if we had no name to help us no one could conceivably discover one particle of Achilles in him. It is true that in the theatrical representation of this drama he was habited as a Greek, appeared at least in helmet and coat of mail; but at the same time his hair was curled and powdered, with broad hips through *poschen*[395], with red claws worked on shoes fastened on the foot with coloured ribbons; and what is more, the "Esther" of Racine was expressly popular in the time of Louis XIV, for the particular reason that Ahasuerus, on his first entrance on the stage, copied the appearance of Louis XIV himself, when he entered the great hall of audience. No doubt, in this transcript, there was a considerable admixture of the oriental luxuriance; but a Ahasuerus he was none the less fully powdered and wearing the royal mantle of ermine, and followed by a complete retinue of curled and powdered chamberlains got up thoroughly *en habit français* with their wigs, their feathered caps under arm, their vests and hoses of *drap d'or*, with their silk stockings and red buckles on their

shoes. All that the court and a select circle of the privileged few were only permitted to see *de facto* was here open to all classes alike — the *entrée* of the king paraded in the poet's verses. The writing of history in France is not unfrequently conducted on very much the same principle. That is to say, history itself and the real objects of history are not the main purpose of the historian, whose interest is rather concentrated either on giving the government in vogue a lesson or teaching others how they ought to detest it. And in the same way there are a host of dramas which, either expressly throughout their entire content or in passing episodes, divert the attention to the events of the day; or, if passages occur in pieces which refer to former times presenting anything which may bear on matters of contemporary interest, the parallel or the contrast is deliberately emphasized with every expression of enthusiasm.

(*γ*) A third type of this personal treatment by the artist of his subject-matter may be sufficiently described as the separation of the same from all genuine artistic form whether it be characteristic of past or present works of art, a mode of production in fact which simply presents us with the entirely evanescent colour of "the man in the street" in his ordinary everyday action and vocation without adding aught to the same. In other words we may describe it as the bare counterpart of what the man of commonsense is conscious in the prosaic facts of life, that and nothing more. In such an atmosphere of prose no doubt everyone finds himself at home readily enough; or rather, he will only not find himself at home who takes up such a work with some definite conception of that which the very conditions of a work of art demand, and consequently is aware that it is precisely from this type of handling that Art undertakes to liberate us. Kotzebue, in his day, obtained all his popular effects through compositions of this kind, which aimed at nothing else but letting the general public both see and hear life's troubles and vexations, the pocketing of silver spoons, the risking of the

pillory, or, to take particular characters, parsons, chamberlains, ensign-bearers, secretaries, and cavalry-majors, in their naked colours. Everyone might here recognize his own household, or, at least, that of some relation or friend, might see at a glance where in his own precious circumstances and aims of life the shoe pinched. An originality of this sort necessarily fails to stir any real sense or idea of that which is the vital content of a work of art, however much it may awake an interest for its productions in hearts that are wont to ask for so little and are so ready to put up with the commonplaces of so-called ethical reflections. We may conclude, then, that the artistic presentation of the facts of external reality under any one of these three types just examined is subjective in a one-sided way, that is to say, it wholly fails to present us with any adequate form of that objective world as it really exists.

(*b*) We next propose to examine a mode of presentation the reverse of the above, one which endeavours to restore us the characters and events of the past so far as may be with every local detail of their former environment no less than any and every ethical or other particular characteristic which formerly distinguished them. We Germans have particularly come to the front in this class of work. As a rule we are, in striking contrast to the French, the most painstaking recorders of all that is peculiar in nations other than our own, and consequently make fidelity to the characteristic usages, dress, weapons, and all such antiquarian detail appropriate to particular epochs and localities a first requisite of our art. Add to this we have the necessary patience to put ourselves to no end of trouble in the way of hard study in order that we may thoroughly enter into the modes of thought and perception which belong to foreign nations and centuries distant from our own, and make ourselves thoroughly conversant with all their peculiarities. This power of looking at facts from many and diverse points of view in order to both apprehend and comprehend the spirit of every kind of national

existence makes us not merely tolerant in our art towards all that strikes us as exceptionally strange in foreign customs, but clamorous even to a painful degree in our insistence that we have before us accurate correspondence with objective truth down to the most insignificant detail. The French are, no doubt, full of resource and energetic, but, however highly educated and practical men they may be, such qualities do not increase, but rather diminish the patience which they possess for quiet and exhaustive study. Criticism is always of first importance with them. We Germans, on the contrary, are by nature inclined to accept any picture of real truth for what it is, and particularly this is so with foreign works of art. From whatever part of Nature's storehouse such may come, whether it is plants or other creations of foreign growth, implements of any kind or form, dogs and cats, even absurdities, we accept them all genially; and the result of this is we are able to be on excellent terms with modes of thought the most removed from our own, ay, sacrificial customs, legends of the saints and all the extraordinary follies that go with them, to say nothing of a host of other marvels equally surprising. And for the same reasons it only appears essentially rational that in attempting to represent characters in action we should make their conversation and pursuits conformable to their own substance, that is to say, in strict accord with the times when they lived and their own national characteristics, whether regarded individually or in association with each other.

This fundamental idea that the objective truth of a work of art is established by virtue of the type of historical accuracy above described has obtained currency in comparatively recent times, mainly, that is to say, since the literary work of Frederick von Schlegel. From that time the importance of a first principle in literary criticism has attached to it; and further than this, it is asserted that our purely personal interest should above all restrict itself to the enjoyment we may derive from historical accuracy of this kind

and the life it thus reproduces. Once accept these hard and fast rules and the conclusion is obvious that we are allowed no additional interest of any superior quality which an enquiry into the essential significance of any artistic content may or may not provide for us any more than we are permitted to derive any interest more vital to ourselves from aspects of such a work directly associated with the culture and aims of our own times. It is much on these lines that we find also in Germany, where the enthusiasm of Herder in this direction started a closer attention on all sides to the "Volkslied," a poetic inundation of national folk-songs imitating native tones of every sort of nationality whether it be the Iroquois, latter-day Greek, Lap, Turk, Tartar, Mongol, and many another; and, of course, it is assumed to be indicative of nothing less than first-rate genius[396] to possess the power of thus diving into the ways and ideas of other folk, and converting all we discover into poetry. At the same time it is clear that however completely your poet may work his way into and emotionally realize all this strange kind of world, it remains and must continue to remain for that public to whose enjoyment these songs are addressed as something very much aloof from it.

The truth is that such a theory, if pressed to its abstract logical conclusion, limits its boundaries solely to the truth of history in its formal accuracy, and by doing so neglects all consideration of the nature of Art's content and questions relative to its essential significance, just as it disregards every aspect of it in which the culture and resources of modern thought and contemporary life are asserted. But it is as impossible to detach ourselves from the truth implied in this theory as it is from equally important truths which it neglects; all equally claim satisfaction, and imperatively force upon us the necessity of finding a further solution in which the claims of historical truth may be reconciled with these rival aspects of truth in a very different way to that just examined. And this

brings us to the third question we proposed as to the nature of that objectivity and subjectivity which can be fully sustained together as the reality to which a genuine work of art conforms.

(*c*) The point of essential importance which we should before all others wish to emphasize here is this, that no one of those various aspects of truth we have above indicated should be allowed a predominant significance such as would impair the relative force of the others; and, further, or rather notwithstanding this, historical accuracy pure and simple in external matters, such as local conditions, customs, usages, and social institutions generally, must receive in a work of art their due place, if a subordinate one, it being only right that the interest of mere historical truth should give way before that of a vitally true and imperishable content for the present no less than the past.

We cannot, perhaps, do better by way of explaining what we consider to be the true form of artistic representation than by setting up in contrast a few examples of some we take to be defective.

(*α*) Now, to start with, the presentation of the characteristic features of a given period may be entirely just, accurate, and impregnated with life, nay more, wholly intelligible to a modern audience, and notwithstanding fail to escape the ordinary atmosphere of prose, and present us with the real substance of poetry. Goethe's "Götz von Berlichingen" will alone furnish us with notable illustrations of this defect. It is only necessary to open the book at the first scene, which introduces us to an inn near Schwarzenberg in Franconia; the *dramatis personae* are Metzler, and Sievers sitting at a table, two grooms by the fire, also the landlord.

Sievers. Another glass of brandy, Hans, my boy, and good Christian measure.

Landlord. You carry a glass that is never full.

Metzler. [*Aside to Sievers*.] Tell us that once again about Berlichingen; the Bambergers are in a pretty fume out there; ay, black as thunder (etc.).

The same kind of thing we find in the third Act.

George. [*Enters with a gutter-spout.*] There you have lead and to spare; spot the target with but one half of it, and devil a soul shall get off, who is like to say to your Majesty, that's a miss this time[397].

Lerse. [*Aloud.*] A fine piece of metal.

George. The rain may take another road for all I care; a brave knight and a real good rain get through most things.

Lerse. [*Pours into glass.*] Hold the spoon. [*Goes to the window.*] There's one of those imperial cockades prowling about with his musket; they believe we have aimed a point too far. He shall have a taste of my bullet, hot too and fresh from the pan. [*Loads.*]

George. [*Drops the spoon.*] Let me have a look.

Lerse. [*Fires.*] There lies the fool (etc.).

All this is exceedingly vivid, intelligible, depicted in perfect keeping with the situation and the characters portrayed. Yet for all that these scenes are both trivial to a degree and essentially prosaic. All we get from either the matter or the form is just the ordinary man's way of seeing things and reality as it appears to him or rather all of us to some extent. We find the same tendency in many another of Goethe's youthful productions, which no doubt were deliberately directed against everything which previously had passed for the rule of the guild, and which sought for their most impressive effect by means of the nearness made clear to ourselves, an impression gained by the extraordinary grasp with which the poet's imagination and feeling seized upon everything. But the nearness was itself too near, and the vital content in part so petty, that such compositions ran constantly into mere triviality. We are most conscious of this kind of triviality in dramatic works when we see them on the stage; it is then that after being worked up

to some excitement by all the concomitants of a theatrical performance, lights, well-dressed folk, and the rest of it, we expect to see something more than a couple of peasants, and troopers and a glass of schnapps thrown in[398]. This phase has mainly found its admirers in readers; it never had a long run on the stage.

(*β*) If we now consider our subject from an opposite point of view it may be admitted that we can sufficiently make ourselves acquainted with and assimilate the historical content of a former mythology and all that is most strange to ourselves in earlier conditions of state-life and national custom to secure through such an intimacy with, the general culture then prevailing a varied knowledge of the past. In fact, this acquaintance with the art, mythology, literature, *cultus*, and usages of antiquity is the starting point of our present system of education. Every schoolboy knows something about the gods and heroes of Greece and the prominent characters in ancient history. It is therefore quite possible, in so far as they really enter into the imaginative life of our own times, that we may find enjoyment in the imaginative representation of such characters and interests. It is further impossible to predict whether or no such an intimacy may not be eventually carried equally as far in the case of the Indian, Egyptian, and Scandinavian mythologies. We may further observe that in the religious conceptions of all these peoples the Universal God is presented. The determinate form, however, of such conceptions, that is to say, the particular gods of Greece or India, are no longer *true* for us as so personified. We do not believe in their existence, and the pleasure we take in them is derived from their appeal to our imagination. For this reason they stand entirely apart from our deepest emotional life, and we can imagine nothing more empty and cold than such exclamations we hear only too often in opera: “O ye gods!” or “O Jupiter!” or even “O Isis and Osiris!” And the folly of it all reaches its height when we have the wretched saws of oracular wisdom thrown in — and the opera

can seldom get along without them — a position of dignity which nowadays for the first time in tragic drama is occupied by pure folly and clairvoyance.

The same criticism applies with equal truth to all other historical material relating to national customs, laws, and the like. Such historical fact is excellent in its way, but it belongs to the past; and when it has once ceased to have anything in common with present life it necessarily ceases, in spite of all our knowledge of it, to belong to us. We have, in short, no interest[399] in what has passed away on the mere ground that it once existed. What is historical can only truly be said to belong to us when it is the possession of the nation, to which we ourselves belong, or when we are able to regard the present as in a general way casually connected with the events in question, to whose continuous series the characters or actions represented are united by a bond of essential membership. For if we carefully consider the matter we shall find that the mere fact of being formerly bound together with the same external environment and people to which we ourselves belong is not sufficient — rather the very part of our nation must present features in still closer relation to the conditions, life, and existence of our own times. To take an example of what we mean, we find ourselves in the Niebelungenlied geographically on a soil that belongs to us still, but the Burgundians and King Etzel are so absolutely cut off from all that touches our present civilization and every interest which is now coincident with patriotism that, without borrowing anything from the learning of the subject, it is but simple truth to say we feel infinitely more at home in the poems of Homer[400]. Klopstock, no doubt, in his enthusiasm for everything that concerned the Fatherland, was prompted to substitute his Scandinavian gods for those of Hellenic mythology; but, for all his zeal, Wotan, Walhalla, and Freja remain mere names for us, which appeal to our imaginations and patriotic emotions even less than Zeus and his compeers of Olympus.

The point above all we desire to emphasize is this. Works of art are not composed primarily for the mere student or the professor, but with the express purpose that they shall be intelligible on their face, and a source of enjoyment without any one having to undertake first a circuitous route of extensive historical investigation. For Art is not addressed to a small and select circle of the privileged few, but to the nation at large. What, moreover, is generally valid for a work of art applies also to the external form of the historical reality therein portrayed. Such exposition also must express itself with clearness open to the common apprehension requiring no considerable research to make it intelligible, must be clear to ourselves as representations of our century and our own people, so that we may be able to find ourselves entirely at home in it, and not have before us a world foreign to that we live in, if not actually unintelligible.

(*γ*) Considerations such as the foregoing have already brought us within reach of the truer conception of the objective truth of art and the mode under which it assimilates the material of past history. We propose now to offer further illustrations in support of the same.

(*αα*) And we may start at once by drawing attention to a characteristic which is common alike to the genuine national poetry of all peoples and in every period of past history, namely, that the historical and formal aspect of that poetry is entirely national, that is to say, it retains nothing incongruous to the people for whom it is composed. This is a feature shared alike by the great epics of India, the Homeric poems and the Greek drama. Sophocles never made his Philoctetes, Antigone, Ajax, Orestes, Œdipus, his choregi and choruses speak in the speech and manner that would have been entirely appropriate to their own times. The Spaniards have written their romances of the Cid under the same guiding principle. Tasso in his “Jerusalem Liberated” celebrated the universal interests of Catholic Christendom. Camoens, the poet of Portugal, depicted the discovery of the seaway to the

East Indies round the Cape of Good Hope, and all the infinitely various adventures of the sea heroes that made it possible; and these acts of daring were the acts of his own people. Shakespeare threw into dramatic form the tragic history of his own country and even a Voltaire wrote his “Henriade.” Far indeed have we Germans strayed from the path thus marked for us when we hope to work up into national epics histories remote from our own, which carry no longer with them a national interest of any kind. Bodmer’s “Noachide” and Kloptock’s “Messias” have started a new fashion of their own, ay, as they have overturned that old one which taught us that it redounds to a nation’s glory to have its Homer, to say nothing of its Pindar and Sophocles. Those biblical stories, it is true, present points of special affinity with the national imagination owing to our close acquaintance with the old and new Testaments; but the historical material in its association with ancient custom and the like remains for all that only intelligible to the savant, and all the most of us can pick up from such epics is the prosaic interfusion of events and characters, which, in such a process of translation, have merely some novel form of speech thrust into their mouths, and the final result can only impress us as hollow and artificial.

(*ββ*) At the same time art cannot be restricted wholly to material borrowed from one nation. And as a matter of fact the more nationalities have come into contact with one another, the more their poets have looked abroad among all nations and times for the subject-matter of their poems. But however this may be the case, it is none the less an error to suppose that the mere fact that a poet is able, so to speak, to live into times aloof from his own at once stamps him as a man of creative genius. It is more to the point to recollect that this historical framework must, in the co-ordination of a poem, be retained only in strict subordination, and as a means of expressing that which permanently belongs to our humanity. Precisely in this way the Middle Ages long ago borrowed much from antiquity, but so

absolutely suffused it with the content of its own epoch that, in this respect verging on the opposite extreme, we really get nothing from that antiquity but the bare names of Alexander, Aeneas, and the emperor Octavius.

First in importance, then, is this permanent condition of true art, immediate intelligibility. It will be found an invariable truth that all nations have emphasized precisely that in this life which was most agreeable to their artistic sense, their desire being always to find what was most intimate to themselves, their life and existence in their art. It was this independent flavour of patriotism which Calderon worked into such characters as his Zenobia and Semiramis; and Shakespeare in the same way was able to imprint upon the most varied subject-matter the hall-mark of his English ancestry, although he knew how to preserve along with it the essential traits of historical characters belonging to nations foreign to his own, the Roman for example, in a far profounder degree than was possible to the Spanish poets. Even the Greek tragedians had their eyes constantly directed to the actual conditions of their times and the particular city in which they lived. The "Œdipus Colonus" in its local references is not merely in a peculiar way associated with Athens but, by virtue of the fact that Œdipus dies in this locality, at once indicates him as the future Preserver of that city. In somewhat other associations the "Eumenides" of Aeschylus is, owing to the decisive sentence of the Areopagus, marked by an interest of more vital interest to the Athenians[401]. On the other hand Greek mythology, despite all the varied and oft repeated use that has been made of it since the revival of the arts and learning, has never fully come home to the general sense of modern emotions and in various degrees in the plastic arts and still more in poetry, despite its very extensive influence here, has failed to arouse real enthusiasm. No one thinks now of writing an ode to Venus, Zeus, or Pallas[402]. Sculpture, it is true, can hardly get along even in modern times without the assistance of the Greek Pantheon, but for that very reason it is

mainly only appreciated by and intelligible to a select circle of cultivated men who are either connoisseurs or critics. As one of these, Goethe spared no pains in his endeavour to arouse in contemporary artists an enthusiasm which should go so far as to imitate the pictures of Philostratus, but for the most part his pains were thrown away. Such examples of the work of antiquity, on account of the very flavour of past time and a life that has vanished, which clings to them, remain as strange to contemporary art as they do to the general public. As a contrary example of real success on the part of Goethe we may instance the far profounder insight he has shown us during the later period of his poetic activity in fusing by means of his "Westöstlicher Divan" the colour of the East with the poetry that really appeals to us to-day, giving to the Orient, in fact, its modern embodiment. In this process of assimilation he has clearly shown himself alive to the fact that he is a poet of the West and a German as well, and consequently while preserving the fundamental key-note of the Oriental spirit in his delineation of characters and situations to which it was appropriate, was able at the same time fully to satisfy the claims of the modern spirit and those of his own personality. Subject to such reservations it is undoubtedly in the province of a poet to borrow his material from remote regions, past centuries and foreign nations, maintaining in their broad and most characteristic outlines the historical form of ancient mythology, custom, and institution. At the same time he will take care to utilize such forms only as the external frame of his delineations, never permitting the essential content of such productions to fall into any disharmony with the profounder instincts of his own native world. As the most extraordinary example of this Goethe's "Iphigenia" still stands without a rival.

In their relation to such a transformation the several arts dispose of their material very differently. In the love-poems of lyrical poetry very little use is made of local associations depicted with historical accuracy. The

emotional situation and the movement of sentiment is here the main thing. We receive, for example, in the sonnets of Petrarch a very small substratum of natural fact relatively to Laura, hardly anything more than her name, which might just as well have been another. Of local interest we get the barest scraps, and that entirely of general significance, such as the existence of the fountain of Vaucluse and things of that kind. Epical poetry, on the contrary, requires the greatest detail in its natural descriptions, and we are most readily pleased with their historical truth, provided always that the picture is both clear and intelligible. The use of the external truth of historical facts presents the greatest pitfalls to dramatic art, more particularly in reference to its theatrical presentation, where everything is directly addressed to an audience, or purports to strike upon sense with the vividness of life, so that we are willing to recognize and entrust ourselves therein with equal directness. Here the delineation of historical truth in its external aspects must for the most part be of subsidiary importance, in fact retain little more than the framework of it. It must, in short, remain true to that natural relation we find in love-poetry, in which at the same time that we are able completely to sympathize with the feelings expressed in every way another name is given to the beloved than that of the lady most loved by ourselves[403]. It does not here in the least signify whether or no our critics fail to discover absolute precision in the picture presented of the particular manners, culture, and emotional expression of the time. In Shakespeare's historical dramas we find a great deal that remains strange to us and of no considerable interest. We are contented enough on a mere reading, but in the theatre our enjoyment ceases. Critics and men of learning no doubt stick fast to their idea that such exquisite scraps of genuine history should be presented on the stage on their own merits and come down severely upon the wretched taste of the public, when it lets us see how bored it is over such things. Unfortunately a work of art and the direct enjoyment we

receive from it is in no sense particularly for critics or savants, but for this very public. Critics have really no reason to give themselves such airs. They are after all but units of this public, and the mere attention to historical detail can be of as little serious interest to them as any other members of it. For this reason the English nowadays in their theatrical performances only include such scenes from the Shakespearean drama which require nothing further to make them clear and intelligible, being happily free from the pedantry of our aesthetic professors who held that all that is most remote in historical incident from the apprehension of an average audience should be thrust before their eyes. It follows also from our view of the matter that when foreign dramas are reproduced on the stage the public is clearly entitled to have them considerably remodelled[404]. Even that which is excellent in itself may require some alteration. No doubt it will be contended that what is essentially first-rate art retains its excellence for all times; but a work of art has also an aspect of transitory worth, which yields to the years, and it is this of course which requires remodelling. As people change so too the sense of beauty alters; and it is important that the particular public, before whom any work is represented, should feel themselves quite at home in the whole of such a work including that aspect which derives all its significance from external history.

It is this conditional acceptance of historical truth which at once explains and justifies that which is generally known in Art as *anachronism*, and which is usually attributed to artists as a serious defect. Primarily such examples of anachronism will be found to attach to matters of purely external interest. That a Falstaff should talk about pistols is no matter of consequence whatever. The case is more serious when we have a violin placed in the hands of Orpheus, for here the association of such prehistorical times with an instrument so essentially modern as the violin, one which everybody knows was not invented in those days, presents too

glaring a violation of truth. For this reason it is now the fashion in theatrical circles to bestow incredible pains and care upon the historical accuracy of details in the matter of costume and the getting up of a piece, as, for example, the infinite trouble lavished upon the historical procession in the "Maid of Orleans."[405] Such efforts are in the majority of eases lost labour, for the simple reason that they only concern matters of relative interest or points that might be wholly passed over. The more important type of anachronisms has nothing whatever to do with stage costume and all that with which stage business is concerned, but consists in making characters express their emotions and ideas, venture upon soliloquies and actions in a form or of a substance which absolutely contradicts the conditions of their times and culture, their religious and general preconceptions. It is common to apply the conception of natural truth to such examples of anachronism, in other words, to say that it is unnatural for characters to speak or act otherwise than they would have spoken and acted in their own days. If we stick, however, too closely to the logic of this naturalism we shall only land ourselves in further complications[406]. For an artist, in depicting the emotional life with all that results from it, and the fundamental passions that belong to it, being mainly interested in the affirmation of individuality, ought not merely to repeat that life under its ordinary daily dress; it is rather his business to show every true manifestation of pathos in the particular light which best reveals its real quality. The whole object of his attainment as an artist is not merely to understand what is of vital significance in the truth he faces, but to be able to give it the precise form which will best direct our own eyes and ears and heart to his own discovery. To attain this it is obvious that he must keep in view the particular culture of his own time no less than all its various powers of expression. In the time of the Trojan war the kind of speech in general use, and indeed the whole fabric of social life, was as far removed from the type of culture which is reflected on us

from the pages of the "Iliad" as the mass of the nation and the pre-eminent worthies of the royal houses then reigning in Greece were separated from the fully developed form of ideas and expression such as arouse our wonder when we read our Aeschylus, or behold the perfected beauty of the style of Sophocles. A violation of the so-called "path of Nature" of this kind is in art an anachronism implied in her laws. The inward kernel of that which she reveals remains unaffected, but the more developed power at the artist's command, in revealing and disclosing this essential core of his subject, renders some change in the mode of its expression inevitable. It is a wholly different matter when a modification of this kind proceeds so far as to impose ideas and conceptions of a later form of the religious and moral consciousness on a century or a nation whose entire spiritual outlook is opposed to such more recent conceptions. The Christian religion has gathered in its train forms of the moral life, which were entirely foreign to the moral consciousness of ancient Greece. That inward introspection of conscience, for example, ever on the alert to decide the ethical significance of action, with its accompanying remorse and repentance, first appears in the moral culture of a more modern date. The heroic character knows nothing of a repentance which sets itself in hostility to its past. What it has done it abides by. Orestes does not repent of his mother's murder. The Furies that rise out of the shadow of his action pursue him, no doubt; but the Eumenides are, at the same time, represented as universal powers, and not as voices that cry out to him from his own conscience simply. This very heart and substance of a given period of man's history a poet must master, and only when we find him interfusing with this central core of reality matter that directly contradicts it is he guilty of any truly grave anachronism. In conclusion, then, we may say that it is indeed part of the poet's function to live into the spirit of past times and foreign peoples, for this substance of their life, if it be truly such, remains a possession for all

time; but to attempt to reflect with every accuracy of detail all the definition of that external show now buried beneath the rust of antiquity is merely the effort of a learning essentially childish, intent on preserving what is itself shadow rather than substance. No doubt even in this direction, the truth of general outlines should be carefully respected, but never to such lengths as would compel art to forfeit her claim of drawing upon the fiction of her invention, and the truth of fact with equal impartiality.

(*γγ*) We are now in a better condition to understand all that is really implied in the assimilation by art of that which is strange in the external features of remote history, and the true conception of the *objective* life of her creations. A work of art must primarily enclose for us within its embrace the higher interests of spirit and volitional power, all that is essentially human, and possesses real weight, the depths, that is to say, of man's emotional life. The main thing of all is that this embodied content[407] should transpierce all purely external conditions of manifestation, should ring, as it were, through all that is less vital in its significance[408] this fundamental chord of truth. The real objectivity, therefore, unfolds as from a sheath, the *pathos*, that is the substantive content of a situation, unfolds, moreover, the rich and powerful personality in which the essential phases of spirit are alive, and find their realization and expression. For such embodiment all that is absolutely indispensable is a definition and determination of the real, which is generally suitable to the object thus defined, and which requires nothing further to explain it. If we have once got hold of such a form unfolded in strict accordance with our Ideal principle, then we have a work of art essentially objective in the true sense, and the question whether each and every historical detail is justified is of no further importance. We have before us a work of art which appeals directly to our inner life, and one which is our own possession. Once possessed of that, and we may take as much as we please of that element of the form

which lay more closely to periods of life which have passed; but the eternal foundation is that which appeals to all men in all places, which is carried forward with a power that never wanes or fails to influence us, and it does so because the objective life it reveals is the same that abounds in and overflows our own souls. That which is merely historical in the appearance is, on the contrary, the element that vanishes; and, in dealing with works of art created in days remote from our own, we must do our best to resolve the discordance, and, indeed, must be fully prepared to blot out from our vision similar defects in works that spring from our own times. Thus it is that the Psalms of David, with their immortal celebration of the Lord in His goodness, and the wrath of His almightiness, no less than the profound sorrows of the Hebrew prophets as they face Babylon and Zion, touch men with the same force to-day as they did of old time: nay, even a moral diatribe, such as is sung by Sarastro in the "Zauberflöte," may come home to the hearts of us all, including the sons of Egypt[409], owing to the soul and vitality which rings through its melodies.

And we may add that every individual to whom a work of art objective in this, the true sense, is presented, must on his part discard his own false prepossessions, wherein he merely wishes to find his own idiosyncrasies repeated. On the first reproduction of "William Tell," it appears, not a single Swiss among the audience was satisfied. In much the same way, when the most beautiful love-songs have been sung, many another, failing to find therein his own passions reflected, has presumed to think the beauty untrue to life; just as so many more, whose knowledge of love is confined to the perusal of romances, have imagined that the love-god would only then be their immortal possession when they found themselves face to face with precisely the same emotions and situations their favourite studies had propounded.

C. THE ARTIST

We have, in this first part of our aesthetical philosophy, examined as a first step the universal Idea of beauty; we then proceeded to inquire in what respects it was defective in its existence as the beauty of Nature, and after thus clearing the way we were in a position to grasp the complete notion of the Ideal as the adequate realization of beauty. We developed the Ideal, *first*, as conceived abstractly according to the *general* notion of it, and having determined that were assisted thereby to elucidate the modes of its *particular* manifestations. Inasmuch, however, as a work of art has its origin in the human spirit it requires the pregnant activity of an individual life from which it proceeds, and as the creation of the same exists for others, that is, a Public which is emotionally receptive. This spiritual and informing activity is the imagination of the *artist*. We have consequently now, and this is the *third* and last aspect of the Ideal to which we shall refer, to raise the question how it comes about that this product of men's inner world is not the direct and native growth[410] of that world, but receives its due form through the *creative impulse* of particular men, in other words, by virtue of the genius and talent of the artist. At the same time we must admit that the question is only raised that we may be able to add the statement that it really is excluded from the sphere of scientific investigation, or, at the most, we can only furnish a few general remarks towards its solution. Yet it is undoubtedly a question frequently raised this, namely, from what source an artist receives the gift and faculty of conception and execution with which he creates his work. We should all of us like, no doubt, to have a ready prescription, a recipe of what we must exactly do, what conditions we must impose on ourselves to produce something as wonderful. We would emulate Cardinal von Este when he asked Ariosto, with reference to his raging Roland: "But, Master Louis, where in the world did you get all this damned stuff from?" Raphael replied to a similar question in a letter we still possess, that he was hunting after a certain idea.

The more obvious aspects of artistic activity we propose to examine under the following heads of discussion:

First, we will give our definition of the general conception of artistic *genius* and the inspiration it implies.

Secondly, we will make a few observations on the *objective* character of this creative activity.

Thirdly, we will endeavour to ascertain in virtue of what real artistic *originality* consists.

1. IMAGINATION, GENIUS, AND INSPIRATION

Before inquiring more closely into the meaning of the term "genius" we must obviously limit the field within which we propose to discuss it. Genius is an expression of very wide connotation, and is used not merely in its application to artists, but equally when we refer to great generals and kings, as also to the heroic captains of scientific discovery. For the sake of simplification we would once more discuss the distinctions involved under a triple division of our subject-matter.

(a) The Imagination[411]

The most conspicuous faculty of an artist which arrests our attention when we direct it expressly upon the capacities implied in artistic productivity is the *imagination.* And we must be careful here not to confuse it with a *visionary fancy* which is wholly passive. The imagination creates.

(*α*) And, in the first place, we shall find that this creative activity carries with it in possession and endowment a peculiar power of *grasping reality* and the forms it presents, all that through the channels of alert eyes and ears imprints pictures of infinite variety caught from the external world upon the mind, and further implies an exceptionally retentive *memory* wherein to store up this varied world of innumerable reflections. The artist, therefore, in this initial stage of our analysis is not merely thrown back upon images

of his own creation, but is rather compelled to turn aside from the dull level of ideals falsely so called and to boldly enter the fields of Nature and Life. To attempt art or poetry merely with fanciful ideas of our own is always a suspicious way of starting on our journey; for the artist must mould his creations from the abundance of his life and by no means from the overplus of abstract generalities. It is not, as in philosophy, thoughts, but the real external forms of what actually exists which furnishes the material for artistic production. In contact with this raw material to work upon the artist must feel thoroughly at home. He must have seen much, heard much, and stored away a great deal as well; and in illustration of this we almost invariably find that a great personality is distinguished by a capacious memory. All that interests mankind he will lay hold of, and the more profound his spirit the more it will enlarge the field of its interests in countless directions. This was the way in which we find the genius of Goethe first opened its wings, and throughout his life the circle of his spirit's restless horizon broadened and broadened. This peculiar gift of receptiveness, this interest in the comprehension of facts after their true definitions and colour, their steadfast adherence to the truth of experience is the first thing we look for in a great artist. And this accurate knowledge of the truth of form must be accompanied in equal measure by a proved acquaintance with the souls of men, the passions that rise in the heart, and everything that it yearns and strives for. And, in addition to this twofold armory of knowledge, he must understand yet further all the various ways that this world of the human soul expresses itself on the face of the reality which confronts his senses, transpiercing thus the outer veil.

(*β*) But, in the second place, this imaginative power is not exhausted with merely receiving that which is presented to the senses, or is inferred as the content of the human soul. The ideal work of art does not merely embrace the outward semblance of the inward spirit as clothed in the forms

of its actual existence, but should rather succeed in manifesting the essential truth and reason of the real itself. This *element of reason*, as determined in the particular object the artist has selected, must not merely be pressed in his own consciousness, as an active influence, but must already have been reflected upon in that essential and rich significance which brings it into relation with the entire breadth and depth of reality. Without reflection no man can grasp fully the wealth that is in him, and it is consequently an inseparable feature of any great work of art that everything which attaches to it both as a whole and in its detail has been long and deeply weighed and thought out. No artistic work of real sterling value can be thrown off with any mere imaginative *tour de force.*[412] We do not, of course, suggest that the artist must therefore comprehend in the form of *philosophical* thought this essential core of reason in his experience; albeit such is the fundamental rock upon which religion no less than philosophy and art is based. Philosophy is by no means essential to his outfit; and, in fact, if he once begins to think about things as a philosopher, he busies himself with modes of thought which are diametrically opposed to that which should engage an artist's attention. For what the imagination undertakes to do and only to do is not to bring to consciousness this inner core of reason in the form of general propositions and conceptions, but to apprehend it clothed in the concrete form of actual existence and individuality. All that ferments within his life the artist must reproduce in the body and envisagement, whose connected picture and general outlines he has already assimilated from the world outside, making such so far subservient to his creative effort that they in their turn may participate in the truth of his own substance and enable him to crown it with complete expression. In this interfusion of an intelligible content with an embodiment received from actual existence the artist will avail himself of the ever wakeful circumspection of his reflective faculties no less than the deep resources of emotional life which leave the

stamp of vitality on his work. It is consequently but one more sample of critical aberration to imagine that poems such as the Homeric were introduced to our poet in his sleep. Without intelligent alertness, division, and distinctions of each part as related to the whole, an artist will be unable to assert his mastery over any form whatsoever that he may wish for; only fools are of the opinion that the genuine artist does not in the least know what his hands and senses are about.

Moreover, the concentration of the artist's emotional life on each aspect of his work is also as necessary to its success as the concentration of his mind. For it is mainly through the impression of emotion, which permeates and gives a vital colour to the entire work, that the artist asserts his claim to the substance and embodiment of his creation as a part of his own spiritual substance, as something he, a given personality, may peculiarly call his own. For the external aspect of his work, the mere picture of it as we may say, tends rather to place us outside it and apart; it is the emotional energy it expresses which primarily unites it with affinity to our very souls. Only when thus understood shall we be able to realize the truth that an artist must not merely have much looked about him in the world and assimilated a rich knowledge both of its outward show and the very substance of its life, but, further, must himself have experienced many things and great things, things that have moved him to the quick and left their life-roots in his own heart and spirit — he must, as we say, have "gone through much" and "lived abundantly" — before he will find himself able to build from his stores in the concrete types of his art something approaching Life's unsounded repletion. And this will at once explain and justify the bluster and ferment of genius in its youth, as amply reflected in the lives of Goethe and Schiller. But only the age of maturity and gray hairs will bring us the perfect work of art in all its rounded ripeness[413].

(b) Talent and Genius

This productive activity of the imagination by means of which the artist gives, by a process of elaboration to that which is essentially rational in its nature, a real embodiment, a creation more his own than anything else — this is what is usually summarized as genius and talent.

(α) We have already drawn attention to those characteristics which are most obviously referable to genius. Genius is the general capacity of creating a genuine example of fine art no less than the energy implied in the execution and elaboration of the same. Moreover, this capability and the power which goes with it is essentially the property of a human soul; that is to say, self-conscious individuality alone is able to create in this sense that a spiritual creation of this quality is just what it sets before itself to produce. Critics, intent on closer definition, are wont to distinguish sharply between genius and talent. And, in fact, they are not absolutely the same things, although it is necessary to find them united in the artist who would give us artistic work of the highest class. To be more exact, Art, in so far as it generally becomes a *particular* art, and is exemplified for us in the real and definite appearance of its products, requires various accomplishments appropriate to the peculiar modes of its realization. Such forms of executive versatility we may call with propriety talent, as we may say that anyone possesses a talent for perfect playing on the violin, or anyone else for singing. But a mere talent for this or that can only effect for us anything really good in the, so to speak, insulated nooks and corners of art[414]; it moreover itself requires for its true perfection something of more universal art-capacity as also that soul-animation, something more which is essentially the hall-mark of genius. Talent, in short, without the vital spark of genius, never gets much beyond a purely mechanical facility.

(β) It is also an opinion very commonly held that superior talent and genius are *inborn.* Here again we must distinguish; for if there is a sense in which this is true, from another point of view it is equally mistaken. No

doubt every man, by virtue of his humanity, receives at his birth the potential gifts of religion, thought, and science. In other words he would not strictly be a man if he did not already possess a capacity to grasp the idea of a Supreme Being, and generally to become the subject of a thinking consciousness. All that he requires to gain these things, in addition to the fact of his human birth, are education, culture, and perseverance. With art, however, the matter stands differently. Art requires *specific* aptitude[415], in which unquestionably natural endowment plays an essential part. As, that is to say, beauty is itself the Idea realized in that which is apprehended as real by the senses, and a work of art embodies the workings of Spirit in a form of existence immediately cognized by the eye and the ear, in the same way the artist must discover and embody the content of his art not in the exclusively spiritual form of thought, but within the sphere of sensuous perception and feeling, and indeed as creator in actual relation to a given sensuous material and within the limits of the same. This artistic creativeness consequently encloses within itself, as art does throughout, the aspect of immediacy envisaged with the directness of Nature's own creations, and it is this appearance, which the individual is unable to evolve from himself, but has to find it, if he finds it at all, as immediately presented to him. Herein lies the significance of the statement, and herein alone, that genius and talent are innate.

In much the same way the several arts adapt themselves as by a kind of natural affinity to particular nations. Song and melody are, we may almost say, the birth-gift of an Italian; with our northern peoples, on the contrary, music[416] and the opera, though seriously cultivated and with great success, are as far from being a real home growth as the orange trees. The Greeks are conspicuous for the native and elaborate beauty of their epic poetry, and most of all for the unique perfection of their sculpture. The Romans never possessed an art that was in any strict sense exclusively their own. All that

grew into blossom on their soil was transplanted from the gardens of Greece. The art whose growth has the widest natural range is that of poetry; and the reason of this is that in it we require least to draw upon a sensuous vehicle for its expressed presentment. Within the province of poetry the folk-song is most of all native to a people and inseparably yoked with their natural conditions. For this very reason the folk-song breaks into blossom even in times of the rudest culture and for the most part retains the unconscious simplicity of Nature herself. Of this Goethe himself is an example. Though he produced works in every type of poetical expression his first songs still go deepest and carry least dust from the study. In them, too, there is least the flavour of culture. The latter-day Greek is still a living witness to a people whose native gift it is both to write poetry and sing. Fauriel has published a collection of modern Greek songs, taken for the most part just as women, nurses, and school-girls were heard singing them, who could not for the world understand what he found so wonderful in them. And this is a good illustration of the way that we find Art and its specific appearance associate itself with a particular national type. In the same way the art of improvization is more than anywhere else the native growth of Italy and exemplified there with quite extraordinary talent. An Italian will even to-day improvize for you a five-act drama, and not a word of it is committed to memory; all grows up out of his experience of human passions and situations and the deeply-excited inspiration of the moment. As an example we mention the fact that a certain poor improvizer after rhapsodizing in this way for a considerable time, and then finally trudging off on his round to collect his pence from the bystanders in a battered hat, was still in such a fume of poetic frenzy that he could not bring his declamations to a stop, waved about in fact so lustily with his arms and hands that in the end all the money he had begged was shaken to the winds.

(*γ*) It is, thirdly[417], a characteristic of genius that it should possess, and indeed it is a part of this natural endowment[418], facility in creating that which it is impelled to create, and in adapting itself to the technical requirements of all the subsidiary aspects of artistic work. We talk, for instance, of the fetters with which the verse, measure, and rhyme shackle a poet; or, when referring to a painter, of the endless difficulties that draughtsmanship, knowledge of tints, chiaroscuro, and the rest fling in the way of invention and execution. Unquestionably a long course of study is a necessary condition of success in all the arts, a perseverance that never tires, a facility that is continually assisted by repetition; the greater the native strength, however, of the genius or superior gift, and the richer its resources the less it will feel the weight of its effort in securing all the necessary accomplishments involved in creative excellence[419]. A really first-rate artist has the lust of work *born in him* and an imperative impulse akin to any other natural want to give artistic form to his emotional and imaginative life that is in him. His emotional life and his ideas irresistibly run into this artistic mould; he finds as it were the instrument already within him made to the hand, so fitted to express his soul-life that all the pains it takes him to learn it are as nothing. A musician can thus unfold to us in his melodies the depths of all that stirs and moves his soul and only by this means. What he feels is at once wafted into melody, just as the life of a painter is impressed upon form and colour, or that of a poet is transmuted into the creations of his imagination, that poetry which clothes his ideas in the beauty and music of the written word. And this gift of vital form the artist does not merely possess as an imaginative power, a phantasy, an emotional impulse “that leaves not a wrack behind,” but as a direct stimulus of feeling to active enterprise, as a gift, that is, of real executive accomplishment. Both of these aspects are united in the real artist. What springs to life in his imagination is immediately alert upon his mobile fingers, precisely as the sudden thought

of our mind breaks into word from the tips, or as our most intimate thoughts, ideas, and emotions are reflected on the outward man and his demeanour. Genius of the real stamp, whenever and wherever found, is easily quit of the difficulties presented by the technical workshop; and indeed has found the most beggarly and apparently impracticable material to accept and embody as it pleased the inward shapes of imagination. No doubt the endowment which the artist finds as a direct gift to himself must be kept alive and alert by indefatigable recourse to it, but he must also possess naturally a practical power of immediate execution. Without this all the facility he may have acquired in imaginative conception will never produce an essentially creative work of art. The very notion of art demands of us that both things should go together hand in hand, the productive energy of the soul and its technical realization in the forms of art.

(c) Inspiration

The activity of the imagination, then, and the power of technical execution, taking both together as the inseparable antecedents of a real artist, are commonly understood as *inspiration.*[420]

(α) The first question that presents itself to us for solution with regard to it is under what conditions it arises, as to which many different views have been held.

($\alpha\alpha$) There is, for instance, the strange notion, to some extent arising from the general truth of the peculiar intimacy with which genius attaches itself to the worlds of conscious life and Nature, that inspiration can be conjured up through mere excitation of the senses. But making our blood dance will not carry us far; we are still a long way off from the Muses, despite the champagne bottle, Such, at least, was the experience of Marmontel, for he tells us that he tried it in a wine-cellar with six thousand bottles of champagne to choose from; but not a breath of the Muses passed over him[421]. Ay, your genius may be as great as he lists, and for all that

stretch himself many a time morning and evening on the green grass, while the fresh breeze floats over him, and stare up into the sky, and not a whisper shall the inspired Muses breathe in his ear.

(*ββ*) Just as little is it likely that we shall make the charmed gates of inspiration spring open by merely presenting ourselves before them with a desire to enter. Whoever fondly imagines that he is in the right mood to compose a poem, or paint a picture, or run off a first-rate melody without already possessing the stuff in him to quicken that spark into vital form, and has first to hunt about for something to say, despite all his talent, will find himself no better off for his best intuitions, quite unable, at any rate, to conceive any complete thing of beauty, or perfect a really sterling work of art. Neither the mere tickling of our senses nor any act of will or determination can father on us true inspiration. To attempt such things simply proves that both the emotional life and the imagination have as yet no real object of artistic interest. When once we have the artistic impulse of the real kind, we may conclude the interest there has already its fixed seal and object, a content that it intends to master.

(*γγ*) True inspiration consequently is fixed in the presence of a specific content, which the imagination takes up in order to give artistic expression to it. It is, in fact, the object of this active process of giving form both as inwardly made visible to the mind, and as outwardly reproduced in the execution of a work of art. Inspiration is equally necessary for both these aspects of artistic activity. The question once more presents itself to us, in what way such a material will come to an artist, in order to bring about this inspiration. We find many various opinions expressed on this head. On the one hand it is frequently required of an artist that the material of his work should be drawn up from the world within him. No doubt this may be so when "the poet sings as a bird from the bough." His own cheerfulness of spirit is then the incentive which enables him to represent a particular mood

of his own as the content of his production, and by this very expression of it he gives vent to his enjoyment of the same. A song of this kind, straight from the heart[422], is indeed a rich reward. But quite as often, however, the greatest works of art are created from the suggestion of objects wholly external to himself. The odes of Pindar were frequently the result of direct commissions; and, in the same way, the object and subject has times without number been given to artists both for buildings and pictures, and they have been able to arouse in themselves an enthusiasm for such. Indeed, it is only too frequently the express complaint of artists that they have not the subject-matter on which to work. Such a reference to things outside, and its stimulus to artistic production, presents just that relation of the artist to Nature and her immediacy which is essential to the notion of superior executive gifts[423], and is at the same time a condition to the appearance of genuine inspiration. If we consider the artist from this point of view, we shall find that it is here that this natural endowment relates itself immediately to a material already found for him, and through the incentive thereby offered him, through the inspiration of actual fact, or as, for example, was the case with Shakespeare, through that which was presented by old tales, ballads, romances, and chronicles, proceeds to embody such material in artistic form, and thereby generally to express his own personality. The impulse to production can therefore be given by something entirely outside the artist's life, and the only condition essential to a successful result is that the interest, which fixes the artist's attention should be of real artistic significance, and that he is able to reproduce the same in all its vitality. Such conditions virtually imply the presence of rare inspiration. And an artist who is really alive and awake himself, by reason of this very vitality of his own powers, discovers endless opportunities for actively asserting the same, and feeling inspired while doing so,

opportunities which pass over other people without similarly affecting them.

(*β*) If we ask further, viz., of what precisely this artistic inspiration consists, we may perhaps best describe it by saying that it is the capacity of being entirely absorbed in a given subject, a capacity not merely wholly to realize it, but incapable of resting until the same is completely minted anew, and rounded off in its artistic form.

(*γ*) Moreover, when an artist has thus entirely appropriated his subject, it is but saying the same thing the other way to affirm that he must know how to forget his own individual idiosyncrasies, and all that accidentally attaches to them; he must, in short, on his part lose himself in the matter on hand. He must make his artistic personality the pure form under which the content he has assimilated is clothed and embodied. An inspiration in which the particular individual receives too emphatic a predominance and assertion, rather than being the vitally active instrument which displays the ideal significance of the material worked upon, is an inferior type of inspiration. This truth opens the way to a fuller consideration of what is generally understood as the objective character of artistic production.

2. THE OBJECTIVE CHARACTER OF THE REPRESENTATION

(*a*) In the ordinary sense of the word we understand objectivity to mean that the content in any work of art necessarily receives the form of the reality already given, and in its artistic embodiment we have the same clearly repeated. In this sense, that we desire to see objective truth reproduced for us, we are entitled to call Kotzebue an objective poet. In his work we undoubtedly find ordinary reality simply as it is again. The object of art is, however, more precisely stated, to strip away not merely the appearance, but the actual content of all that meets us every day, and by means of the spiritual activity of the artist most personal to himself, to work

out that which is essentially rational in that content in its really adequate external form. Indeed, if we look at yet better examples of art than Kotzebue's, such as those we have already glanced at in the youthful productions of Goethe, we shall find that this realistic type of objectivity can be made essentially living in its expression, and by virtue of this quality prove highly attractive to ourselves, and yet, on account of the fact that the artistic form remains defective, fail to arrive at the real beauty of art. Purely external objectivity, therefore, which still lacks the abiding and substantial significance, is not that for which an artist should strive.

(*b*) A second type of objective realization presents itself to us in the case where we find the external is not the artistic aim, but the artist has seized hold of his subject with all the depth and strength of his emotional life. This inward aspect of his work remains, however, so entirely enclosed within itself and concentrated that it fails to assert itself with a clearness thoroughly possessed, or to unfold itself in its full truth. The eloquence of pathos simply restricts itself by means of illustrations external to it, without possessing either the power or the culture to be able to present the fulness of that content in an explicit form. Folksongs pre-eminently belong to such a mode of artistic production. Extremely simple as they are in their form, they suggest an emotional life which lies at their root of still wider range and depth, but which they are unable clearly to express. Their art, in fact, is itself not sufficiently elaborate or complete enough to carry into the light of day with transparent reflection all that it would unfold, and is forced to rest satisfied with suggesting to our sympathies the same by means of an external symbolism. The heart remains thrown back and concentrated upon itself, and in order to make its life intelligible to others, casts but a fainter reflection of its world upon entirely finite and external circumstances and phenomena, which, no doubt, are thus eloquent in a degree, albeit we receive from them only a far-off echo of the emotions and life they would

bring home to us. Goethe has himself written many quite exquisite songs of this kind. "The Shepherd's Lament" is one of the most beautiful. In this refrain a heart that is broken with pain and yearning still remains silent and reserved beneath the purely external traits which would fain relieve it; and, despite of this, we hear, as through an undertone, all the concentrated depth of emotion it fails to express. In the "Erl-king," and many other of his songs, we hear the same tone. This tone, however, we may also meet in degenerate form right down to the most futile barbarism, unable to grasp either the essential character of the facts or the situation, merely clinging to their most finite aspects in all their crudeness and absence of artistic taste. An example we may give from the "Drummer-comrade of the boy Wunderhorn,"[424] such inanities as "O thou dwelling house of man, O gallows," or "Adjutant sir corporal," expressions which are supposed to move us deeply. When on the contrary Goethe sings:

Der Strauss, den ich gepflücket,
Grüsse Dich viel tausendmal,
Ich habe mich oft gebücket
Und ihn aus Herz gedrücket,
Ach, wie viel tausendmal[425].

strong emotion is suggested in a very different way, which brings before our mind nothing trivial or contrary to the main idea. What however is, as a rule, defective in this particular type of poetical realization is the expression of emotion in all its true intensity. This, in the rarest art, should not be suffered to remain a depth shut away, which merely reflects a distant echo through the external objects presented: it should either break forth in its full character, or be seen through the vehicle with complete transparency. Schiller, for example, brings out his soul in its full strength in the pathos of

his work, withal a great soul, which penetrates to the very core of his subject, and is able to express its very deepest significance in the freest and most perspicuous way through the wealth and music of his verse.

(*c*) In conformity, then, with the notion of the Ideal, we may conclude that even when we are dealing with the mere expression of emotional life, we shall never fully establish our title to truly objective art so long as any part of all that is comprised in the subject-matter, which stirs the artistic inspiration, remains still wrapped up within the soul that seeks to express itself; rather all that lies there should be completely unfolded, and unfolded in a way which not merely shall reveal to us the essential soul and substance of the content selected, but shall embody it in some completely homogeneous type of individual art, through which, as through a transparency, both soul and substance shall radiate. For that which is highest and most excellent is not by any means that we are unable to express, as though the poet contained in himself still greater depths than those expressed on the face of his work. The work of an artist is the consummate fruit of that artist, and reflects precisely what he is, and only what he is, and all that remains behind in the temple of his soul is a naught or nothing[426].

3. MANNER, STYLE, AND ORIGINALITY

However much it may be imperatively required of the artist that he should give to his work an objective character such as we have above indicated, this must not make us oblivious to the fact that the artist's production is at the same time the work of *his* inspiration; it is he alone who has, by his entire identification of his personality with the specific subject-matter and its artistic embodiment, brought into being the entire creation out of the life of his *own* emotional nature and imagination. And it is this identity of the free personality of the artist and the truly objective construction of his artistic creation which constitutes the third fundamental

aspect of his activity as set forth above and which we must now shortly consider, in so far as we may be thus enabled to unite that which we have hitherto separated in our independent consideration of the conceptions of genius and the objective presentment of a work of art. We may characterize such a unity as the conception of true artistic *originality.* Before, however, we come to close quarters with all that is implied in this conception, it is necessary to clearly grasp two points of view already related to it whose insufficiency we have to expose on the ground of their one-sidedness before a true conception of originality can be fully appreciated. These may be sufficiently indicated by the terms "subjective *manner*"[427] and *style*.

(a) The Subjective Manner

The point of first importance in discussing the meaning of the expression "artistic manner" is to differentiate it fundamentally from artistic originality. The term "manner," in our view, is only used in direct relation to the *specific* and consequently *accidental idiosyncrasies* of the artist, that is, merely in so far as such qualities assert themselves as effective in his work without being called forth by the nature of the subject itself and its ideal exposition.

(*α*) A manner thus interpreted has no connection with the universal types of art, that is to say, types which require an essentially different mode of representation, as, for instance, the landscape painter necessarily treats the objects of Nature in quite a different way from that under which a historical painter would so treat them; or the epic poet would handle similar subject-matter in a different way from that appropriate to the dramatic poet. On the contrary, "a manner" is a form of artistic expression wholly emanating from a particular individuality, an entirely supposititious idiosyncrasy of executive ability which may be carried so far as to contradict absolutely the true notion of the Ideal. As thus defined "manner" stands at the bottom of the scale among the forms which may characterize an artist's general

handling. An artist who thus expresses his individuality simply gives free rein to any chance notions of his own without testing them as subject to the substantive claims of art. But it is a fundamental principle of art that it should abolish precisely all that is merely accidental to its content no less than to its artistic or rather external mode of presentment. And this is only to say that it requires of the artist that he should efface from his work all traces of purely personal tastes and idiosyncrasies he shares with no one else[428].

(*β*) And for these reasons we would point out that “a manner” of this kind is not so much to be contrasted directly with the true exposition of art as to be considered in relation to the purely external aspects of art where the individuality of the particular mode of treatment comes into play. This kind of manner is most conspicuous in the arts of painting and music for the reason that these arts[429] present to the artist the widest variety of external characterization for him to seize upon and reproduce. What we find here is a certain artificial manner of general execution entirely peculiar to some particular artist and the school of imitators or pupils who follow him, which through constant repetition degenerates into mere habit.

(*αα*) And its tendency is to develop on one of two ways in which we may regard the artistic work. First, there is the aspect of its composition. To take painting, for example, we have all the variety of ways under which the prevailing atmospheric tone, the arrangement of foliage, the contrast of light and shade, in short the entire scheme of colour may be treated. Most particularly in this feature of the general scheme[430] of the colouring and lighting of a picture we find that painters permit themselves the most varied freedom of individual preference and distaste. Of course such a prevailing tone may appear to us as that we do not find in Nature for the simple reason that we have not had our attention directed to it although it is really there. But we shall often find that such a scheme has simply been adopted by this

or that artist on grounds of personal taste or convenience[431], and it becomes simply a habit in him to use everything now as subject to that particular scheme. And what we have observed with reference to colouring is equally true when applied to the treatment of natural objects, their grouping, position, motion, and general characterization. This inferior mode of treatment is particularly to be observed in the works of the Dutch school. Take the case of Van der Neer's night-scenes and his artificial presentation of moonlight, or Van der Goyen's sand-hills in so many of his landscapes. The ever-repeated reflections of light from satin and silk stuffs that we find in so many pictures of other masters of the same school are indications of the same artificial mode of handling.

(*ββ*) A manner of this type may be still further, traced in the execution of other details, the handling of brush or pencil, the laying on and blending of tints and many other features of executive work.

(*γγ*) The general conclusion we come to, after considering all such examples of specialized handling and conception in which constant repetition grows at last habitual to, and indeed becomes a second nature of the artist, is this, that just in proportion as the manner adopted is more specialized[432], there is an increasing and dangerous tendency for it to degenerate into that which is nothing more than a soulless and consequently arid repetition and mechanical exercise, throughout which the artist is no longer present with the fulness of his spiritual resources and the entire strength of his inspiration. When this takes place his art necessarily sinks to the level of a mere executive facility or accomplishment of his hands, and a manner, otherwise innocent enough, may very readily grow starved and lifeless.

(*γ*) The more truly artistic "manner" has consequently to disengage itself from such jejune peculiarities, to broaden out into a freer atmosphere[433], so that no specialized mode of handling shall be suffered to sterilize itself into

what is simply a matter of habit. In this way an artist will approach the facts of Nature with a breadth of view more in keeping with her own, and will understand how to identify his larger conceptions and the general technique of his craft with the same ideal spirit. In something of the same sense we may describe it as a peculiar manner of Goethe that he is particularly apt in concluding not merely poems of society but also openings to works of a more serious character with a sudden turn of pleasantry, in order to remove the impression of or throw into the background the serious nature of previous reflection or situation. We meet with the same characteristic in the correspondence of Horace. It is, in fact, an application of the art of conversation and general sociability, which, in order to avoid following up any matter more deeply, comes to a stop, breaks off and cleverly diverts the serious into more cheerful channels. Such a mode of the literary art is undoubtedly part of the manner of the artist and his individual style, but the individuality thus exemplified is based upon a broader principle, and is asserted in a way wholly justified by the artistic purpose of the work in hand. And this particular type of an artistic manner will enable us to pass readily to the consideration of “style” generally.

(b) Style

Le style c’est l’homme même is a famous phrase of the French. Style is here generally understood as the unique characterization of personality, the particular mode of expression, however it may be applied, which wholly reveals to us its substance. Herr von Rumohr, on the other hand (“Italian Investigations,” i, p. 87), endeavours to interpret the expression as a mode habitual through its constant repetition of bringing together the most vital characteristics of the subject-matter artistically treated, by virtue of which the sculptor informs his figures with reality, and the painter gives to his the appearance of life. He further adds important observations upon the

appropriate form of representation which, in the case of an art such as sculpture, the specific *sensuous* material either permits or proscribes. It is, however, not necessary to attach the expression "style" solely to this aspect of sensuous material; we may unquestionably extend it to all those determinations and rules of artistic production which apply naturally to any particular type of art, and in virtue of which an object is reproduced in the medium of any one of them. We consequently distinguish in the art of music the style of church music from that of opera, and in that of painting, the historical style from the style of *genre* painting. Style is therefore a mode of artistic presentation, which not merely follows closely the fundamental conditions of its material, but asserts itself as adequate to all that any particular type of art demands for its composition and execution and in strict conformity with the laws which apply to the subject-matter on hand. Defect of style will then, in this extension of the meaning, either imply an inability to present a composition in accordance with such necessary conditions, or will amount to a personal caprice which rather gives free rein to its own particular predilections than accepts the conditions of composition which are really proposed to it, in other words adopts an inferior "manner" of its own. Consequently it is inadmissible, as Herr von Rumohr has already pointed out, to apply principles peculiar to one type of art to another, as Mengs has done in his famous museum in the villa Albani, where both in the general conception and execution of his Apollo he adopts the modes of colouring applicable only to sculpture. A defect of the same kind may be traced in many of the pictures of Dürer, where we see that even in painting, especially in the folding of his drapery, he adopts the style of wood-cut in which he is so consummate a master.

(c) Originality

The final result, then, of our inquiry on this head is that true originality does not consist in merely conforming to the paramount conditions of style,

but in a kind of inspired state[434] personal to the artist which, instead of committing itself wholly to a mere external manner of composition, seizes hold of a particular subject-matter that is essentially rational, and by virtue of its own resources and quality, re-clothes the same as from within the artist himself and not merely in a way conformable to the essential notion of the art adopted, but also in a form adequate to the universal notion of the Ideal.

(α) True originality is consequently identical with true objectivity, and combines that which is due to the personality of the artist and the actual subject-matter of his work in such a way that both aspects of his artistic product are held together in complete accord. Looked at in one way, such a work appears to reveal to us the very essence of the artist's personality, while regarded from another we only find there the essence of the subject-matter artistically treated, so that this very uniqueness of expression appears to arise from the unique characteristics of the material to which it is applied; and we may say with equal truth either that the expressed form is due to those characteristics, or that this unique impression we obtain from them proceeds from the creative unity of the artist.

(β) True originality must be entirely kept distinct from individual caprice and every kind of personal expression that is due to fortuitous causes. A common idea of originality is simply the stringing together of so many curiosities, things which this particular individual and no other could perpetuate or even faintly imagine. That is, however, merely idiosyncracy gone mad. No people on earth are more original in this meaning of the term than Englishmen, a country where every one prides himself on committing some folly or other, which no man in his senses is likely to repeat, and then fondly imagines his performance to be original.

We may in this connection briefly refer to what has been so extolled, and never more than in our own days as the originality of wit and humour. An

artist of this type of humour starts off from a point of view or an experience wholly personal to himself, and constantly recurs to the same so that the real object of his artistic production is merely treated as the peg on which he may hang, or the field in which he may give full play to, whatever wittiness, jest, quirks, and sallies his mood may chance to light upon. In this way the real object of his art and that which should render it vital in himself fall entirely apart, and we have a capricious mode of artistic production, in which the idiosyncrasy of the artist is made to appear as of first importance. A humour of this kind is often replete with intellectual brilliance and deep feeling, and in its general result is very apt to impose on us; yet for all that it is not generally such a difficult matter as is commonly believed. To constantly interrupt the rational content of that which we are really dealing with, interrupting all steady progress with a stream of capricious fresh starts and conclusions, a sort of patchwork of whims and emotional excursions, and thereby to create a caricature of imaginative vigour is far easier than to develop and round off with completeness an artistic whole of sterling quality throughout such as will testify to the real Ideal. Moreover, our humour nowadays is only too ready to give us the repulsive features of a talent for wit essentially crude, and is constantly degenerating into coarse buffoonery and emptiness. We do not often get from it real humour at all. The stalest trivialities are wont to pass now for brilliancy and depth of soul provided they only rig themselves out in the pretentious motley of humour. Shakespeare, on the contrary, possessed a grand and profound sense of humour, but even his works are by no means destitute of shallows. The humour of Jean Paul too often surprises us with the depth of its wit and the beauty of its sentiment, but we are quite as often repelled by the absurdly eccentric way in which he hitches together his subjects, or rather leaves them with the bare jointure to lie apart, and then floods all he has to say with a kind of humour that leaves it almost impossible to make head or tail

of. No humourist, however great he may be, is likely to find anything resembling it in his memory; and our main impression is frequently, even in the case of Jean Paul's kaleidoscopic effects, that they are rather the result of mechanical pasting together than a spontaneous product from the crucible of genius. For this reason Jean Paul finds it necessary, in order continually to present new effects, to drag into books differing wholly in kind, botanical, legal and philosophical disquisitions, no less than descriptions of travel; whatever whim in fact may strike his fancy at the time is promptly inserted. Even when his subject relates to scientific discovery he will run together the most heterogeneous material such as a collection of Brazilian plants and observations upon the old imperial chamber[435]. There are people who will praise a motley of this kind as original. But it is really precisely the kind of caprice which originality of the genuine stamp excludes.

While we are on this topic it will not be out of place to add some further remarks upon irony, which particularly prides itself upon presenting us with the very flower of originality on just those occasions when it has ceased to treat any artistic material with seriousness and converts the whole affair into a subject of witticism, only worth notice for the sake of the wit it suggests. Looked at from another point of view this irony rakes together a lot of things which are quite foreign to the essence of the matter in hand, things the deeper significance of which the poet keeps to himself, and his notion seems to be that by this subtle exercise of his powers the imagination will be enlarged. And it is just in external associations of this sort that we get what we have already described as the poetry of a poetry, wherein everything that is deepest and most excellent is concealed from us for no other reason than this, that we must not be allowed to look at it because it is so profound. And we really find in Friedrich von Schlegel's poetry, more particularly when he became vain over his title to the rank of poet, that

which clearly is set forth as the aroma of all is just that which is never expressed: no wonder this poetry of poetry turns out to be the flattest prose.

(*γ*) A genuine work of art must consequently be held intact from all originality of this perverse type. True originality will be asserted throughout by this and this alone, that the work has the appearance of being the unique creation of *one* individual mind, which does not go about picking up scraps from around it and then make thereof a patchwork, but permits the material of that work, in complete accordance with the unity most congenial to its own substance, to bind itself together in a whole all parts of which are strictly related, as truly stamped with one mint as the founder's cast. When we find scenes and motives introduced upon grounds that are foreign to the real artistic purpose, that is to say, which do not directly grow out of the true subject, we must inevitably lose that subtle and necessary connection of all the parts which create this unity, and what we thus interpolate will unavoidably impress us as something fortuitously attached by personal caprice. Much in this way it has been the fashion to give exceptional praise to the "Götz von Berlichingen" of Goethe on the grounds of its great originality. No doubt it is true enough, as we have above remarked, that in this drama Goethe has with much intrepidity given the lie direct to and turned his back upon all that had been taken as the established principles of the aesthetic science of his age; the execution of this work, however, does not bear the stamp of genuine originality. One finds, on the contrary, in this youthful production indications of the poverty of the material upon which it is founded, so that many traits and entire scenes appear to have been raked together and united by connections foreign to the subject from material of an interest contemporary with that of the artist's life instead of being the genuine elaboration of the fundamental subject-matter. The scene, for example, between Götz and brother Martin, where Martin Luther is clearly suggested, contains ideas which Goethe could only have borrowed from a time such as his own when people began once more to wail over the conditions of monastic life, how they durst not drink wine, could only sleep

off their meals, were at the mercy of evil desires and generally must submit to the three intolerable vows of poverty, chastity, and obedience. Brother Martin, on the other hand, grows enthusiastic over the knightly life of Götz, how he recalled to memory the load of booty he took from his foe, whom he ran through with lance on horseback before he could shoot, then tumbled over, horse and all, and finally returned to his castle and wife. Whereupon the good monk drinks the health of the dame Elizabeth, wiping his eyes the while. With mundane reflections of this sort Luther never started on his journey, but rather as a pious monk who had penetrated to their depths the religious conceptions and convictions of Augustine, another source altogether. Subject to precisely similar defects are the pedagogical references to that period which occur in the following scene and for which Vasedow is mainly responsible. We are informed that children of that age are taught much that is unintelligible, that the true method of instruction should rather educate their minds through the senses and experience. Karl, for example, repeats phrases to his father by heart precisely similar to those current in Goethe's own younger days: "Junthausen is a village and castle on the Junt and for two hundred years has been the ancestral property of the lords of Berlichingen." When Götz asks him if he knows any lord of Berlichingen personally the lad stares blankly at him and through sheer over-teaching does not know his own father. Götz declares that he knew every path and road in the country before he knew the names of a single river, village, or mountain. All this kind of thing is mere literary stucco which has nothing to do with the actual subject at all. And when an occasion does arise in which we ought to find some really characteristic grip of the very marrow of the subject, as in the conversations between Götz and Weisslingen, we get nothing more than cold reflections upon the times.

We find much the same association of irrelevant matter in the same poet's "Wahlverwandschaften."[436] The laying out of pleasure grounds, the

living pictures, the observations upon pendulum oscillations, the testing of metals, the headaches, the entire description of elective affinities, which is borrowed straight from chemical science, are all of this category. It may, of course, be freely admitted that in a romance, referring to an essentially prosaic age, such things are*prima facie* admissible, and more particularly so when we have a Goethe to introduce them so cleverly and apply them so charmingly; moreover no work of art of any kind can be kept wholly unaffected by the culture of the artist's own age. It is one thing to allow the reflection of contemporary culture to appear as part of the artistic whole, quite another to bring together such material of research in a way that places it as something wholly outside and independent of the genuine substance of the composition. For the true originality of the artist no less than that of his work consists exclusively in their being vitally bound up with that which is only intelligible as part of the real subject-matter treated. When the artist has fully Appropriated this objective reason, without mixing up with it, to the detriment of its clarity, details he may have borrowed from his personal experience or other sources which do not strictly belong to it; in that case alone will he stamp the material with the genuine mark of his own artistic mintage. This personal effect upon his work merely serves him as a bridge of Life over which he passes to secure a work of art wholly complete in itself, just as in all genuine thought and action true freedom consists in allowing that which is of essential significance to assert itself without restraint, so that it becomes itself the force which dominates both the particular thought and volition of the man who thus appropriates it, and by so doing reconciles every vestige of opposition. In this way the originality of art absorbs every accidental trait peculiar to a given personality; but it only absorbs it that the artist may follow without reserve the impulse and bent of his genius as inspired through every fibre of the material he moulds, and instead of reflecting a purely barren wilfulness and

caprice of his own may give an objective form to his true artistic individuality conjoined with consummate accomplishment. To have no "manner" was ever the one great "manner," and in this sense alone can we ascribe originality to Homer, Sophocles, Rafael, and Shakespeare.

[271] *Einer specifischen Seele.* We certainly should not in ordinary speech say that inorganic objects possessed a soul. The phrase indeed is difficult to follow, except as explained by the previous technical discussion of *Einzelheit.*

[272] The expression *in dieser der Allgemeinheit entgegengehobenen Äusserlichkeit* refers to the manifold in opposition to which the principle of universality is posited as a test for the selection of those aspects which manifest it as vital individuality.

[273] *Seligkeit.*

[274] *Heiterkeit.* I cannot satisfy myself with one English word. It seems to combine both *blithesomeness* and *cheerfulness* in the literal meaning of the word.

[275] *In das einfache Beisichseyn.* Self-containedness would be more literal.

[276] *Eine Versöhnung des Gemüths.* I think this refers to the emotions of the spectators. The use of the word in the next sentence points to this.

[277] *Diese Festigkeit*, *e.g.*, such a religiously austere mode of treatment, rather this than "rigorously true," is I think the sense.

[278] Compare that wonderful poem of G. Meredith, "Theodolinda."

[279] *Schönthuerei.*

[280] See Introduction, pp. 86, 87.

[281] Such appears to me the sense of the above passage, but it is not very clearly expressed. Hegel states the case of those who contend that a picture must be a good one because the ideal element is the main thing and to get that you have merely to borrow from poetry. He then takes an example to show this is not so.

[282] Here commences the more thorough exposition of the difficulty.

[283] *Vorstellung*, “world of ideas” would be perhaps better.

[284] Apart from an error in punctuation I think this sentence is not as Hegel wrote it, certainly it is not as he would have left it after revision; as it stands the grammatical construction is entirely split into two discordant sections. I have at least made it grammatical.

[285] *Die Vorstellung*, *i.e.*, the imaginative conception.

[286] There is, however, the question of positive characterization imposed on the work by the artist. The work of Michelangelo is of course an extreme example. This is here rather overlooked.

[287] That is to say, it remains the potency of many forms; it is left in its abstract formality to be variously formed by limbs in their motion and not cut into the forms devised by a tailor.

[288] Infinite, of course, not in the sense of extension, but because it is a constituent of the universal medium of thought, infinite as the judgment is so.

[289] This analysis of Dutch painting is remarkable for its insight and impartiality, and may be contrasted in this respect with the writings of Ruskin.

[290] *Die höhere Seele.* The ideal atmosphere throughout.

[291] It will be recalled that it was precisely this picture, or one much resembling, that Ruskin, with less sympathy, criticized severely.

[292] No doubt these were other pictures in the exhibition of pictures contemporary with the date of Hegel’s lecture.

[293] Ideal.

[294] *Auf willkürlich festgesetzten Zeichen*.

[295] Not a very lucid sentence. I presume the words *bei deren Anblick* refer, to the forms, not to the beauty which reposes on them. The abstractness of such a point of view is obvious.

[296] I think *sein eigenes Wollen* must practically amount to this. But it is all very vague.

[297] *Handlung.* See below.

[298] *Vollbringen des Menschen.* The bringing up to fuller content.

[299] Lit., "turned outside upon to confront, like a coat turned inside out that the inside may face external facts."

[300] The German term is *Selbständigkeit.* It may often be better translated by "independence."

[301] *Durchgreifende.* That which penetrates the whole as the *causa efficiens.* The whole passage is difficult and technical.

[302] *Für sich selbst.* That is to say, a substance that is not dependent on another for its reality but is explicit as such out of its own resources.

[303] *Für das Allgemeine*.

[304] *In einer Nacht.* A condensed description of the true story apparently.

[305] That is to say, it is made up of units all ready to pull in different directions.

[306] A remarkable instance of the type in our own days was General Gordon. A perusal of his correspondence from Khartoum makes it sufficiently clear that he considered it his duty to remain despite all orders to the contrary, so long as the garrison remained unwithdrawn; no doubt he considered the reverse course dishonourable to England, but first of all it was dishonourable to himself.

[307] *Fürsicheinsiehen.*

[308] *Das Vornehme.* There is probably here a further allusion to the respectability associated with grandeur. The same is true of the compositions of the great Italian painters.

[309] *Ausgebildeten.* I have hesitated to translate this "cultivated" as the context appears to suggest rather the kind of *regime* we find in the highly official centralization of such a monarchy as that of Prussia in Hegel's time or the artificial eighteenth century. But the whole passage rings rather strangely to modern ideas, or at least to English notions of democracy.

[310] *Götz von Berlichengen* was Goethe's first drama, published in the year 1773, though the first version of it was written in 1771.

[311] *Das Waltende*, *e.g.*, a force which is predominant.

[312] *Gehalt*, content, that is, in its configurative energy.

[313] *Sichverwirklichen*, that is, objective self-realization.

[314] The whole of this passage is difficult to follow and translate, and has roots, no doubt, in some of the most disputed positions in Hegelian philosophy, such as the independent reality of Nature, and the use that Hegel makes of such conceptions as Chance (*Zufälligkeit*) in his explanation of it. All that can be attempted here is to give some kind of intelligible interpretation of the expressions employed literally. The student will do well to consult Professor A. C. Bradley's criticism of Hegel's Idea of tragedy in his "Lectures on Poetry."

[315] The situation without defined situation.

[316] *Festigkeit.* Staunchness is perhaps better.

[317] *Harmlosigkeit*, *e.g.*, its inability to cause conflict.

[318] Such as painting and sculpture.

[319] By positive he means that in themselves they are not actually discordant or negative but only render such discordance possible in their relation to spirit.

[320] That is, where a collision depends upon natural causes.

[321] Positive, that is, relative to a particular concrete condition.

[322] Perhaps *Erfindung* would here be better translated with "invention." Both processes are involved in the word.

[323] *Auf den natürlichen äusserlichen Verlauf.*

[324] This must be implied, for it can only be asserted with qualification of sculpture and it is not true of music.

[325] *In betreff seiner Besinnung. Besinnung* suggests, no doubt, something more of mind than *Gemüth.* It is the entire content of self-consciousness on its sensuous side.

[326] *Die allgemeinen Mächte.* This phrase is explained in the paragraph which follows.

[327] *Die Bethätigung.* The actualization would be a better word perhaps.

[328] It may surprise some readers in such a context suddenly to be confronted with such serious matters. But with Hegel such surprises must be expected. With him the root of all spiritual activity is never far absent, and the relation of the State is founded on the same basis as that of the Church. And if we mean anything by the phrase of the Divine Immanence we shall at least be able to follow him.

[329] *Die ewigen.* Eternal because essentially belonging to the explication of reason.

[330] *Würde.* Worthiness of personal characteristics, *i.e.*, ethical character.

[331] *Das nur äuserlich Feststehende*. The organizations of Spirit are the most permanent realities is, I think, the meaning.

[332] *Etwas bizarres oder widriges*, *i.e.*, that which is arbitrary and merely awakes curiosity or excites a feeling of repulsion.

[333] There is obviously a symbolic meaning in this poem of Hartmann which Hegel appears to have overlooked, the sacrifice which the monks prescribed not necessarily involving a physical sacrifice, but merely the gift of a love which would be equal to such a sacrifice.

[334] This passage is not easy to follow. I think *der innre Begriff* must mean the entire notion of the personality evolved in the action as distinct from all particular aspects which are negative and evil. The main difficulty of the passage consists in the abstract conception of evil or the negative upon which Hegel centres the attention.

[335] *Halt*, *i.e.*, stable self-consistency.

[336] *Die innre haltlose Zerrissenkeit.*

[337] *Abgeschlossenheit*, *i.e.*, self-exclusive individuality.

[338] *Zur subjektiven Innerlichkeit.* That is to say, the entire self-concentration on the spiritual centre of conscious life.

[339] Lit., Their individuality remains rather external form, in such a way that it fails to penetrate through to absolutely inward subjectivity.

[340] *Noth*, the constraint of necessary conditions.

[341] *Mit der Bestimmten*, *i.e.*, with the definite subject-matter of temporal life.

[342] In the conception, that is to say, which is at the root of the Greek idea of Divinity.

[343] I presume what Hegel means is as individual gods.

[344] *Er nicht mit seinem eigenen Selbst dabei ist.* He fails to obtain the determinate freedom of the self-excluding subject.

[345] *I.e.*, between gods and men.

[346] *Ganz prosaisch.* Viewed practically, that is to say, rather than metaphysically. The examples explain the meaning.

[347] *Das Thun geht stets herüber und hinüber.* Is a skein in which the threads run over and under one another.

[348] "*Iliad*," I, v, 190.

[349] This view may be well contrasted with the less vital criticism of Schiller on this subject, which induced him actually to exclude the feature from his amended edition of the play. In fact Hegel shows more insight here than Coleridge.

[350] *Nicht über Hamlet haltlos verfügt.* It is also obvious, I think, that such a passage need not necessarily be opposed to Goethe's main conception. Such ideas may readily be explained as the excuses of a man who inherently shrinks from forming a grave resolve of vigorous action. No doubts are suggested when Hamlet sees the ghost.

[351] *Den eigentlichen Mittelpunkt.* Between what? I think the examples show that it is both between a work of human art and Nature and between the work of art itself and those to whom it is addressed.

[352] Lit., Screws itself like a corkscrew into.

[353] *Ausmalung*. The metaphor is taken from the art of painting and technically refers to the finish of the same in all its details. It is here used generally.

[354] Vol. i, p. 153. I do not know the book.

[355] *Als bewegendes Pathos.* This may mean "as the motive principle of pathos," but I incline to the interpretation "as the pathos which affects others."

[356] This appears at first sight to be somewhat contrary to the statement made above (p. 309) that "We cannot affirm pathos of the gods." But if my translation in the above passage is the right one *Die Götter werden zum menschlichen Pathos*, I think we must understand *Die Götter* here in a more universal sense of the Divine than in the former passage, and find the emphasis here is laid upon the word *menschlichen.* It is, in fact, but another way of stating the incarnation of the Divine in humanity.

[357] *Als totale Individualität*, *i.e.*, all that is comprised in its essential notion.

[358] *Der handelnden Character*, *i.e.*, Character manifest in the action.

[359] *Ausser sich*, "goes to the dogs," as we say in vulgar parlance, *i.e.*, ceases to be character in the true sense at all.

[360] This example shows us that by the expression *früheren Götter* above Hegel must be referring to prehistoric times and quite archaic conceptions of Greek godhead.

[361] *Eines in sick gebildeten Innern. Gebildet* here used in the sense of perfected, rounded to a co-ordinated content.

[362] *Hineingegraben*, lit., buried in.

[363] I am unable to express in two words the contrast presented by the German *tragen* and *ertragen.*

[364] It is not easy to strike the exact interpretation of such a word as *Quetschlichkeit.* Apparently this or the more usual term *Quabbelig* have the sense of "shaking." I believe there is a synonym for quaker's grass, viz., quatch-grass.

[365] *Und durch sie sich hindurchziehen.* The most obvious sense of these words would be: and (*i.e.*, the threads) carry themselves on through it (*i.e.*, externality). Perhaps the meaning is that the relations in question not merely unite the Ideal to the world but are carried beyond (with the Ideal) the natural external world into that higher plane of the objective spiritual world. In my translation I have practically evaded the difficulty and assumed there is either something missing, or we must understand, I admit, a very harsh change of subject.

[366] Through self-consciousness he is both the individual subject and the form of an infinite content.

[367] *Eine subjektive Totalität.*

[368] I have amplified this sentence to make it quite clear to which of the three worlds, viz., (*a*) the subjective world in its abstraction, (*b*) the external world in its abstraction or, finally, the world of reality, in which *a* and *b* are mutually related, the writer here refers.

[369] *In welche die in sick totale Einheit des Ideals nicht mehr ihrer konkreten Geistigkeit nach hineinzuscheinen befähigt ist.* Lit., Into which the self-complete unity of the Ideal is no longer capable of penetrating by virtue of the concrete spirituality which it essentially is.

[370] An obvious distinction between the arts of architecture and garden-construction is that in the former all the materials used have been already informed by human hands at least where building is in any advanced stage.

[371] Hegel's actual words would seem to imply that the fact a garden is created for use and enjoyment is detrimental to its beauty.

[372] It must be admitted that this summary treatment of gardens is not very satisfactory. No doubt the best authorities concur in the view that the formal garden is more artistic than the landscape, but hardly on the main ground given here. Landscape gardening such as we find it in our great English country houses has a real justification of its own. And with regard to the reason given that a garden should be entirely subordinate to the human object do we not strike here upon a weakness which is to a certain extent apparent also in Hegel's theory of the artistic purpose of architecture. I think it must be admitted that though it is true the object of both these arts is not entirely for their own beauty, and in certain cases, not even primarily so, as in the case of a senate-house or ordinary garden, yet where the artistic purpose is manifested throughout with great deliberation they may be essentially an independent work of art; take the case,.of a cathedral, for example, or a really beautiful and homogeneous formal garden.

[373] *Element*, subject-matter would be really a better word.

[374] *Kein bloss quantatives.* They are not like a heap of stones, for example, but they possess relations which qualify each other, as of course the heap of stones will do in so far as it is distinguished by diversity of colour.

[375] I think this must be the meaning of the words *noch ah blass aufgelöste Gegensätze auftreten.*

[376] *Grau* is the word Hegel uses, but I think he must use it in the sense I have translated it. Gray in itself is a very beautiful compound, and the subtlety of its use is that which is one of the distinguishing characteristics of the very greatest colourists such as Turner and Velazquez.

[377] I am not quite sure that Hegel means this exactly, but it is no doubt what an artist would mean and in water-colour especially it is of the utmost importance. Compare the flesh colour of the artists such as our Watts or Titian with that of Leighton. One of the most marvellous examples I know is a small picture of Titian, the subject of which is Herodias with the head of John the Baptist, in one of the palaces at Rome. But a modern critic would, apart from the question of dirtiness, about which there can be no doubt, say that Hegel insists too much, precisely as Ruskin does, on the superiority of the pure single colour.

[378] Hegel appears to be himself slightly incorrect here. No doubt a string may ring false if it is not tightly fastened or if too slack or too long it may produce sounds the human ear is unable to appreciate. But primarily what musicians mean by a string ringing false, with wolf notes and so on, is due to the bad material or false composition of the string itself.

[379] *Disparat*, *i.e.*, composed of different elements, not merely separate in position.

[380] I think the expression *ein blosses an-sich* must mean this here. Of course the usual meaning is that of something potential, unrealized, but here I think it rather signifies “not objectively or really valid.” No doubt in relation to the heads of discussion it is potential also.

[381] *Die traurige Bünkelsängerei.* I think the adjective must here rather refer to the contrast than to the nature of the poetry. I presume the Minnesingers are referred to.

[382] I do not know what book this is, nor have I ever heard of a hero with the name of *Otnith.*

[383] Or rather by virtue both of its medium and object. *Ihrer Natur nach* are Hegel’s words.

[384] *Jenem ersten Ansichseyenden.* That is to say, a relation indefinite, but essentially implying a further realization.

[385] *Es nur eine unwahre Abstraction bezeigen würde.* “Lack of comprehensiveness” would, of course, be more literal.

[386] *In ihrem abstracten Gehalt.* That is, regarded simply as the opinions of a private individual, and apart from all that may be implied in it under more universal relations.

[387] *Der Zustand der allgemeinen Bildung*, not an easy phrase to translate: the Culture-State” perhaps sums it up most completely. “The state of universal education” is too indefinite or goes too far.

[388] The whole spirit of this passage is a striking witness to Hegel’s admiration for classical art. Whether the arguments brought forward are wholly sound when we consider them in connection with the Elizabethan drama, for example, may readily admit of a question. At the same time, as Hegel himself points out, Shakespeare unquestionably throws the time back to what is practically a mythical age in at least three of his greatest tragedies, “Hamlet,” “Macbeth,” and above all “King Lear.”

[389] For the element of beauty implied in ordinary craftsmanship, and the modern view, pressed so strongly by William Morris and others, of this aspect of art and its modern necessity, the reader should peruse Professor Bosanquet’s valuable “Three Lectures on Aesthetic” (see particularly Lecture II, p. 61 *et seq.*).

[390] Even an admirer of our author must admit, I think, here that the argument is somewhat overstrained. That Hegel possessed real humour and yet more irony few will deny who have studied him, but at times “the man with a theory” rather tends, as is so frequently the case with our German cousins, Goethe himself not excepted, to swallow up such sanative juices altogether.

[391] I presume the meaning is that the poem in the shape we now have it dates some 400 years after the Trojan war. But it is not very clear from Hegel’s language whether he regards Homer as the poet who, as in the case of his example of the poet of the Niebelungenlied, fused that together or no. For if he did how could he have lived through the poems, an expression itself which is rather vague, more particularly as the better opinion is that they represent a different age themselves.

[392] *Vernürnbergert.* A word of course coined by Hegel. Made them, that is to say, at home in the Nuremberg of Hans Sachs.

[393] "Best of all things water." Compare Meredith's exquisite poem "Phoebus with Admetus," "Water, first of singers o'er rocky mount and mead," etc., stanza 3.

[394] The drama of Racine.

[395] What this word means I do not know — possibly quill-feathers.

[396] *Eine grosse Genialität.* "First-rate genius" is rather too strong, "talents of the highest rank" would be more literal. We have no word that expresses *Genialität.* As the passage is ironical I have allowed "genius" to pass.

[397] *Wir haben schlecht gestanden.* Literally, "there is some mistake between us." But the idiomatic sense I presume is, "You've made a bad shot this time."

[398] What would Hegel have said of the first scene in the "Merchant of Venice"? No doubt Shakespeare's play contains very much more than such scenes, and there is a profound significance in that opening scene, for it at once emphasizes the collision of families upon which the entire tragedy turns. But is such a defence needed? There appears to be indubitably a certain deficiency in the above criticism. There is no reason that a scene in which a couple of peasants and two troopers are the *dramatis personae* should not be infinitely amusing provided a Shakespeare, or even a Goethe, when he is not in one of his dull moods, performs the office of teaching them how to speak.

[399] This surely goes too far unless "interest" is taken strictly to mean artistic interest which would appear to be so from the context. Everything that has once interested or affected mankind, however remote, has at heart an historical and antiquarian interest, and I am not sure that we should not be right in adding a general human interest. At least such is almost a dogma with a poet of the type of Browning.

[400] I do not know the Teutonic poem here referred to. But what about Wagner's famous tetralogy? The above arguments, though containing much that is true, appear to overlook for one thing the symbolic significance of mythological history, and in a certain sense to be lacking in sympathy for everything that is not modern or Hellenic. How very differently Carlyle, for example, referred to this very mythology, and his learning was not profound in the German sense.

[401] The intention of Aeschylus went, of course, much farther than this, and the entire play is essentially one written by a staunch conservative against modern innovation.

[402] It is strange that Hegel should have ventured such a generalization in the face of his old friend Holderlein's poetry. In England some fine poems have been written such as Lady Margaret Sackville's hymn to Dionysus and Swinburne's to Proserpine. But for a good essay in support of the main contention I know none equal to Russell Lowell's Essay on Swinburne's "Atalanta." I think that both our author and the critic who supports him somewhat fail to recognize the permanent reality, whether symbolical or directly spiritual, that an increasing number of men find in these Hellenic personalities, as illustrated in the poetry of Meredith, to take the finest flavour of the type.

[403] I presume this is the meaning of *unserer eigenen Geliebten*, but from the example given of Petrarch's Laura one would rather have expected that it was the poet's beloved whose name was not given. In any case the sense is rather obscure.

[404] I think it must be admitted that Hegel goes too far in the other extreme. The best tendency of our times is to reproduce Shakespeare as near to the best authenticated text as possible. No doubt our adaptation of French plays is in a certain sense an illustration of Hegel's contention; but generally it is recognized that where a work is great, as for example in the case of our Greek plays, it is far better to let them speak for themselves, and attempt no botching.

[405] Schiller's play.

[406] *Schiefheiten*, errors that divert truth from its path.

[407] We should rather have expected *Erhalt* than *Gehalt* here. *Gehalt* means, therefore, the essential part of the entire manifestation.

[408] *Durch all das anderweitige Getriebe*, *i.e.*, through all that is otherwise mechanical.

[409] I am not certain whether there is a definite allusion here to anything in particular, or whether the Egyptian is taken to signify any folk outside Western culture, with possibly some subtle suggestion of those who held the favoured people in bondage, Philistines in short.

[410] *Herausgeboren ist*, cast forth, that is to say, as the natural growth of it — as Minerva from the head of Zeus.

[411] Imagination appears to me the best translation of *Phantasie.* Our English word, however, seems rather to lie between it and *Vorstellung*. Practically Hegel means here what we mean when we distinguish it from fancy (*Einbildungskraft*), though in Ruskin's original and most suggestive analysis

of the terms, "fancy" of course implied a limited power of creative activity or at least associative activity.

[412] *Leichtfertigkeit der Phantasie*, *i.e.*, a careless facility of imaginative activity.

[413] It must not be overlooked, however, that, especially in the arts of music and painting, genius may have reached maturity at a very early period, as was the case with Mozart, Rafael, and many another.

[414] *Ganz vereinzelten Seite.* It is a little strange to find such an expression applied to the arts of violin-playing or singing. But the emphasis is not so much on the art as a whole as to the technical aspect of execution.

[415] *Anlage*, lit., a laying to, an impulse in a certain direction.

[416] This statement is rather surprising from a fellow countryman of Bach, Handel, Mozart, etc., down to Wagner and Strauss. The explanation appears *first* to be due to the distinction between a national impulse toward popular singing which the Italian no doubt possesses, and a deep-rooted emotional life which finally discovers its supreme mode of expression in the art of instrumental music as developed by the Teuton stock. *Secondly*, it is quite clear, I think, from Hegel's correspondence that he had no real sympathy for orchestral music though an enthusiastic admirer of opera, particularly Italian opera.

[417] The other two aspects were: (*a*) That genius is a spiritual activity and in its operation offers a contrast to talent, where the personal initiative is not so prominent, (*b*) It has a certain aspect which may be called innate.

[418] It is a little surprising to find Hegel tracing technical accomplishment to the native gift. At least all technical accomplishment has to be learned.

[419] This is the real point. Whatever ignoramuses may say of the "shackles" of verse poets know only too well that they supply a supreme stimulus to imaginative powers both in virtue of the atmosphere of music into which they are thus carried and the suggestiveness of the words themselves. What Hegel's analysis appears rather to fail in is his perception of the unconscious work in the greatest men when working in most inspired moments whether in painting or poetry — the extraordinary power of their intuition.

[420] No doubt Hegel does not use our word "inspiration" in quite the sense it is usually used, and I should have said even less so the German word. At the same time we do apply the word inspiration to

the technical execution and most justly where it is used as a distinction.

421 Meredith in a letter to a correspondent expresses the same conviction. He even adds that he thinks Schiller's compositions were by no means improved by artificial stimulants.

422 The Germans say, a song which "rings straight from the throat," *der aus der Kehle dringt.*

423 *Welche zum Begriff des Talente gehört.* Talent no doubt to some extent includes genius here, but mainly in its aspect of productive power.

424 I do not know the composition and cannot make much of the quotations. For all I know *Tamboure-gesellen* may be the drummer-boy himself.

425 This translation may pass perhaps:

"This little nosegay plucked by me
A thousand times may it greet thee!
How many thousand times have I
Bowed over it; how many times
Pressed it to heart; how many times!"

426 Or, as Hegel puts it, "*that* he is not."

427 We should rather say a personal or individual manner perhaps.

428 I have translated *Zufälligen* here with the words "he shares with no one else." The suggestion is that there is no warrant or principle to support them.

429 It is rather surprising to find Hegel including music here rather than sculpture or architecture, especially the latter, which seems peculiarly adapted to illustrate what I understand to be his general point of view. His own illustrations throw no light on the matter as they are borrowed from painting or poetry.

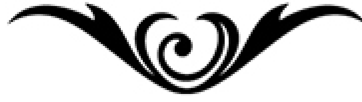
430 I presume the difference here alluded to is such as we may see if we contrast the tone of a Correggio, for instance, with that of a Titian or a Rembrandt.

431 *Er hat ihn sich angeeignet.* Lack of artistic power is the main factor in an artificial style. Though there are doubtless many examples of men forced to paint in a way much below their true powers to

obtain a living. But it must be admitted Hegel does not express himself very clearly. Individuality of handling is essential to a great master. The real point is that it should not crystallize into a *mere* habit, as in the Bologna school of painters.

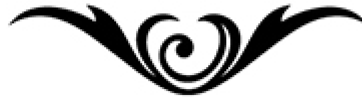
[432] "Artificial" would perhaps come closer to the mark.

[433] *In sich selbst zu erweitern.* The phrase at once suggests by contrast that expression so frequently used by painters of "tightness," incapacity to enlarge, which is such a characteristic of artificial handling, and indeed of most academic work, and so frequently gives to the original sketch of an artist a greater artistic value than to the highly finished work.



[434] *In der subjektiven Begeistrung.*

[435] The chamber at Wetzlar.



[436] Elective Affinities.

SECOND PART

EVOLUTION OF THE IDEAL IN THE PARTICULAR TYPES OF FINE ART

INTRODUCTION

ALL THAT HAS hitherto been the object of our examination in the first part of this inquiry referred to the reality of the Idea of the beautiful as Ideal of art. In whatever direction, however, we developed the notion of the ideal art-product, we throughout applied to it a meaning of purely general signification. But the idea of the beautiful implies a totality likewise of essential differences, which as such must in veritable form assert themselves. These differences we may broadly describe as the *particular modes* of art, as the evolved content of that which is implied in the notion of the Ideal, and which secures actual form through art. When, however, we speak of these forms of art as of distinct species or grades[1] of the Ideal, we do not accept the term in the ordinary usage of it as though we found here in external guise particular classes of objects related to and modifying the Ideal respectively as their common genus. Species in the sense used here simply expresses the various and continuously expanding determination of the idea of the beautiful and the Ideal of art itself. The universality of the ideal representation is in the case posited not determined on the side of external existence, but is assumed to be the closer determination of itself in the explication of its own notion; or, in other words, it is the notion itself which unfolds itself in a totality of particular types of art.

More closely regarded, then, the specific types of art have their origin, as the unfolded realization of the Idea of the beautiful, in the very nature of the Idea itself, which by means of them presses forward to real and concrete appearance. Moreover, just in so far as it ceases to expand[2] in the abstract determination or concrete fulness of any one of them, it manifests itself in some other form of realized expression. For the Idea is only Idea in its

essential truth in so far as it proceeds in this self-evolution by means of its own activity. And inasmuch as it is, as Ideal, immediate appearance, and moreover with each mode thereof is still identical as the idea of the beautiful, we find that in every particular phase which reveals the Ideal in its process of self-explication we have another actual manifestation which is immediately related to the essential characterization of those diverse types of yet further expansion. It really is a matter of no consequence whether we regard this process as a process of the Idea within its own substance, or that of the form under which it attains determinate existence, inasmuch as both aspects are immediately bound up with each other, and the perfecting of the Idea as content, and the perfecting of its form are but two ways of expressing the same process. Or, to put the matter in the reverse way, the defects of a given form of art of this kind betray themselves as a defect of the Idea, in so far as such defects give a limited significance to the essential nature of the Idea in external form, and as such invest it with reality. When we consequently compare such still inadequate forms of art with what most obviously presents itself for comparison, that is, the true Ideal, we must be careful not to use expressions commonly applicable to works of art that are failures, which either express nothing at all, or have discovered an incompetence to express what ought to have been expressed. Rather for every form of the Idea there is a definite mode of appearance, which clothes it precisely in one of those particular forms of art to which we have adverted, adequate in every respect thereto, and the defective or perfected character of which consists entirely in the relative truth or untruth of the determinate form, under which and through which the Idea is actually realized. For the content must first be clothed with reality and concreteness before it can attain to the form wholly adequate to its essential truth. As we have already indicated in the previous division of our subject-matter, we have three fundamental forms or types of art to examine.

First, we have the *symbolical.* In this the Idea is still seeking for its true artistic expression, because it is here still essentially abstract and undetermined, and consequently has not mastered for itself the external appearance adequate to its own substance, but rather finds itself in unresolved opposition to the external objects in physical Nature and the world of mankind. And inasmuch as in this crude relation to objective existence it immediately surmises its own isolation, or is carried into some form of concrete existence by means, of universal characteristics which are void of all true definition, it vitiates and falsifies the actual forms of reality which it has found, and which it seizes in a wholly capricious way[3]. And, consequently, instead of being able to identify itself completely with the object, it can only assert a kind of accord, or rather a still abstract reflection of significance and figure, a mode of representation which, being neither complete in its artistic fusion, nor capable of being completed, suffers the object to emerge as reciprocally external, strange, and inadequate to itself as it was before.

Secondly, we have the form in which the Idea, here in accordance with its true notional activity, is carried beyond the abstraction and indeterminacy of general characterization[4], is conscious of itself as free and infinite subjectivity, and grasps that self-conscious life in its real existence as Spirit (Mind). Spirit, as the free subject of consciousness, is self-determined through its own resources, and even in this its conscious grasp of self-determination possesses a form of externality adequate to express it, and one in which the essential import of that consciousness can be united with an explicit reality entirely appropriate. This second type of art, the *classical*, is based upon such absolutely homogeneous unity of content and form. In order, however, to make this unity complete the human spirit, in so far as it makes itself the object of art, must not be taken as Spirit in the absolute significance we refer to it, where it discovers its adequate

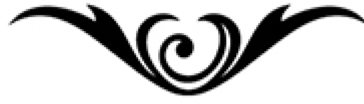
subsistence wholly in the *spiritual* resources of its own essential domain, but rather as a still *individualized* spirit, and as such charged with a certain aspect of isolation. In other words, the free individual which classical art unites to its forms appears, it is true, as essentially universal, and consequently freed from all the mere contingence and particularity both of the subjective world of mind and the external world of Nature. But it is at the same time permeated by a universality which is itself essentially individualized. For the external form is necessarily both defined and singular by virtue of its externality, which it is only capable of completely fusing with an artistic content by representing that content as itself defined, and consequently of a limited character; and, moreover, it is only Spirit that is thus particularized which can pass into an objective shape and unite itself with the same in an inseparable unity.

In this form Art has reached the fulness of its own notion to this extent, namely, that the Idea, which is here spiritual individuality, brought into immediate accord with itself in the form of its bodily presence, receives from it a presentation so complete, that external existence is no longer able to preserve its consistency as against the ideal significance which it serves to express; or, to put it in the reverse way, the spiritual content is exclusively manifested in the elaborated form within which Art clothes it for sensuous perception, and thereby affirmatively asserts itself in the same.

Thirdly, we have the form in which the Idea of beauty grasps its own being as *absolute* Spirit, Spirit, that is to say, in the full consciousness of its untrammelled freedom. But for this very reason it is unable any more to obtain complete realization in forms which are external; its true determinate existence is now that which it possesses in itself as Spirit. That unity of the life of Spirit and its external appearance which we find in classical art is unbound, and it flees from the same once more into itself. It is this recoil which presents to us the fundamental type of the *romantic* type of art. Here

we find, by reason of the free spirituality which pervades the content, such content makes a more ideal demand upon expression than the mere representation through an external or physical medium is able to supply; the form on its external side sinks therefore to a relation of *indifference*; and in the romantic form of art we consequently meet with a separation between content and form as we previously found it in the symbolic form, with this difference that it is now due to the subordination of matter to spiritual expression rather than the predominance of externality over ideal significance. It is in this way that symbolic art *seeks* after that perfected unity of ideal significance and external form, which classical art in its representation of substantive individuality succeeds in *communicating* to sensuous perception, and which romantic art *passes over and beyond* through its overwhelming insistence on the claims of Spirit.

[1] *Art.* Hegel takes the ordinary scientific sense to describe the meaning. The word “type” would more truly express it.



[2] *Für sich selber ist.* That is, having arrived at one form of determination, returns upon itself and throws off another form, just as the plant germ after arriving at the leaf expands into the bud, and so on.

[3] That is, with no reference to intelligent principle.

[4] *Allgemeiner Gedanken.* Hegel means the bare generalizations or abstract conceptions of thought.

SUBSECTION I

THE SYMBOLIC TYPE OF ART

INTRODUCTION

OF THE SYMBOL GENERALLY

Symbol, in the signification we here attach to the word, is not merely the beginning of art from the point of view of its notional development, but marks also its first appearance in history. We may consequently regard it as only the forecourt of art, which is principally the possession of the East, and through which, after a variety of transitional steps and mediating passages, we are at last introduced to the genuine realization of the Ideal in the classical type of art. We must therefore from the very first take care to distinguish symbol where its unique characteristics provide it with an independent sphere of its own, in which it determines the radical and effective type of a certain form of art's exposition and presentment from that kind of symbolic expression which amounts to no more than a purely external aspect of form entirely without such independent significance. In the latter sense we, in fact, come across it in the classical and romantic forms of art just as certain aspects of symbolical art are not wholly without the characteristic features of the classical Ideal, or present to us the origins of romantic art. Such reciprocal interplay between the fundamental forms of art attaches, however, merely to subsidiary images or isolated traits; it has no power whatever to modify, still less to expunge, the animating principle which essentially determines the character of the entire work of art.

In such cases where we find symbol elaborated in its entirely unique and independent form it is as a general rule characterized by the quality of the *sublime*, because its main impression is to show us the Idea still united to measureless dimension rather than rounded in a free and self-defined content; it would fain clothe itself with form, and yet is unable to secure in the substantial appearances of the world a definite form which is entirely adequate to express the abstractness and universality of its longing. On account of this inability to attain its purpose the Idea passes over and beyond the external existence which surrounds it instead of penetrating to the core or completely making its home therein. And this flight beyond the limits of the finite and visible world is precisely that which constitutes the general character of the sublime.

But before we proceed further it will be convenient, by way of elucidating the formal aspect of our subject, to explain at once, if in quite general terms, what we understand by the expression symbol.

Generally speaking, symbol is some form of external existence immediately presented to the senses, which, however, is not accepted for its own worth, as it lies thus before us in its immediacy, but for the wider and more general significance which it offers to our reflection. We may consequently distinguish between two points of view equally applicable to the term; first, the *significance*, and, secondly, the mode in which such significance is *expressed*. The *first* is a conception of the mind, or an object which stands wholly indifferent to any particular content, the *latter* is a form of sensuous existence or a representation of some kind or other.

1. Symbol, then, is in the first place a *sign.* When we speak of the significant and nothing more there is no necessary connection between the thing signified and its *modus* of expression whatever. This manner of its expression, this sensuous thing or image, so far from being immediately called up by that for which it is the sign, rather presents itself to the

imagination as a wholly foreign content to it, by no means necessarily associated with it in a unique way. So, for example, in language tones are signs of specific conditions of idea or emotion. By far the greater number of the tones of any language are, however, associated with the ideas, which are thereby expressed entirely by chance, so far as the content of those ideas is concerned, even though the history of the development of language may show us that the original connection between the two was of a different nature, and that an essential element in the difference between one language and another consists in this, that the same idea is expressed through a different sound. Another example of such bare signs are colours[5], which we used in cockades or flags in order to express the nationality of an individual or vessel. Such colours by themselves alone carry no particular quality which can be immediately related to the thing they signify, that is, the nation which they represent. In a sense such as this, where the bond between the signification and the sign is one of *indifference*, symbol must not be understood when we connect the expression with art. For art consists precisely in the reciprocal relation, affinity, and substantive fusion of significance and form.

2. We must consequently interpret sign in a different sense when we speak of it as equivalent to symbol. The lion is, for example, a symbol of magnanimity, the fox symbolizes cunning, the circle eternity, the triangle the Triune God. Here we find that the lion and the fox themselves possess the qualities whose import they serve to express. In the same way the circle points beyond the mere indefinite extension, or the capriciously fixed limit of a straight line, or any other line that does not return upon itself, and which at the same time is suitable as the expression of a definite period of time; and the triangle regarded as a *totality* possesses the same number of sides and angles as is involved in the idea of God, when the determinations

under which the religious consciousness defines the Supreme Being are expressed numerically.

In the latter forms of symbol therefore the objects presented to the senses have already in their own existence that significance, to represent and express which they are used; symbol as employed in this expanded sense is consequently no purely indifferent mark for something other than itself, but a significant fact which in its own external form already presents the content of the idea which it symbolizes. At the same time it is not the concrete thing it is itself, which it should bring before the imagination, but simply that general quality of significance which attaches to it.

3. We would, thirdly, draw attention to the fact that although symbol may not, as is the case with the purely external and formal sign, be wholly inadequate to the significance derived from it, yet, in order that it may retain its character as symbol, it must on the other hand present an aspect which is strange to it. In other words, though the content which is significant, and the form which is used to typify it in respect to a *single* quality, unite in agreement, none the less the symbolical form must possess at the same time still *other* qualities entirely independent of that *one* which is shared by it, and is once for all marked as significant, just as the content[6] need not necessarily be a bare abstract quality such as strength or cunning, but rather a concrete substance, which on its side, too, possesses a variety of characteristics which distinguish it from the primary quality in which its symbolic character consists, and in the same way, but to a still greater degree, from everything else that characterizes the symbolical form. The lion, for example, possesses other qualities than mere strength, the fox than mere cunning, and the apprehension of God is not necessarily bound up with conceptions which imply number. The content, therefore, as thus viewed, is also placed in a relation of *indifference* to the symbolical form, which represents it, and the abstract quality which it typifies may quite

possibly be present in countless other existing objects. In the same way a content which is thus varied in its composition may possess many qualities, to symbolize any of which other forms will equally serve where a similar correspondence with such is apparent. The same reasoning is also applicable to the external object in which any particular content[7] is symbolically expressed. Such an object, in its concrete natural existence, possesses a number of characteristics for all of which it may stand as the symbol. The most obvious symbol for strength is unquestionably the lion, but the ox and the horn of the ox may equally serve as such, and from other points of view the ox possesses many other qualities as significant. But few objects, if any, have been brought home to the imagination with such a prodigal wealth of symbolic form and imagery as that of the Supreme Being. We may conclude, then, from the above remarks that the use of the term symbol is necessarily[8] and essentially open to *ambiguity.*

(*a*) For, in the first place, no sooner do we look for some symbol than the doubt almost invariably arises whether a *particular form is to be accepted as a symbol or no*; and this is so, though we set on one side the further ambiguity with reference to the *particular* nature of the content, which a given form under all the *variety* of its aspects may be held to symbolize, many of which may be employed symbolically through associating links that do not appear on the surface[9].

Now what a symbol primarily offers us is generally speaking a form, an image, which of itself is the presentment of an immediate fact. Such immediate existence, or its image, a lion for example, an eagle, or a particular colour, stands there before us as it is, a valid existing fact. The question consequently arises whether a lion, whose image is set before us, merely is set there to express the natural fact, or whether in addition to this it carries a further significance, that is the more abstract connotation of mere strength, or the more concrete one of a hero or a period of the year,

husbandry and anything else we choose to infer from it; whether in fact, as we say, the image is to be taken literally, or with a further ideal significance, or possibly only with the latter. The last case finds its illustration in symbolical expressions of speech and particular words such as comprehension, conclusion[10] and others of the same kind. When such signify mental activities we have simply set before us the immediate import of a mental activity and no more without any recall to our memory of the material acts, which originally were implied in the meaning of these words. When on the contrary the picture of a lion is presented us we have not merely the significance to consider which it may bear as symbol, but also the bodily shape and presence of the king of beasts before our eyes. An ambiguity of this nature can only fully disappear when the sense attached to both aspects, namely, symbolical import, and its external form, is expressly stated, and we learn by this means the exact relation which exists between them. In that case, however, the concrete fact which is set before us ceases to be a symbol in the real meaning of the term, and becomes simply an image, the relation of which to significance is expressed by the well-known form of comparison, namely, *simile.* In the simile, that is to say, both factors are immediately presented to us, the general conception and its concrete image. When on the contrary reflection has not proceeded so far as to hold general conceptions in assured independence, and consequently to set them forth by themselves, in that case we find that the sensuous image to which they are cognate, and in which a significance of more general[11] import is able to find its expression is not yet conceived as separate from such a significance, but both are still immediately held together in unity. And this it is which, as we shall see more closely as we proceed, constitutes the distinction between symbol and comparison. An illustration of the latter kind may be found in that exclamation of Karl Moor, as he gazes on the setting sun: “Thus dies a hero!” Here we see that the ideal significance is

expressly separated from the sensuous impression while at the same time it is associated with the picture. In other cases, it is true even of similes this act of separation in relation is not so clearly marked, and the association appears to be more immediate; in such cases it must already appear manifest from the general content of the narrative, from the position assigned to the picture, or other circumstances, that viewed as merely a statement of fact, such an image is not justified, but that some special significance or other, which cannot fail to arrest our attention, is intended by it. When, for example, Luther says:

A steadfast stronghold is our God.

or we read:

In den Ocean schifft mit tausend Masten der Jungling,
Still auf geretteten Boot treibt in den Hafen der Greis[12].

we can have no doubt whatever upon the implied significance, whether it be of a protection suggested by "stronghold," the world of hopes and life-plans symbolized in the picture of the ocean and the thousand masts; or the narrowed aims and possessions with the assured plot of ground at the end, which is reflected from the boat and the haven. In the same way when we read in the Old Testament: "May God break their teeth in their mouth, may the Lord shatter the hindermost teeth of the young lions," it is obvious that neither the words "mouth," "teeth," nor "hindermost teeth of the young lions" are used in the literal sense, but are utilized as images and sensuous ideas, which carry a significance only present to the mind, and that such *significance* is all that matters.

This ambiguity, then, is all the more conspicuous in the case of symbolical representation for the reason that an image, which carries a particular significance, only receives the descriptive name of *symbol* when such significance ceases to be expressly marked by itself, or is otherwise

clearly emphasized as it is in the case of the simile. No doubt the ambiguity of the genuine symbol is to this extent removed in that by virtue of this very uncertainty the fusion of the sensuous image and its significance becomes a matter more or less of convention and custom, a feature which is indispensably necessary in the case where mere signs are used, while on the other hand the simile asserts itself as something individual, discovered on the spur of the moment to assist the meaning, and is independently clear, because it emphasizes the significance alongside of that independence. At the same time, though no doubt the symbol may be clear enough to those who are habituated to its use, and whose imaginative life is at home in such a conventional atmosphere, it is a very different matter with all who are outside this native circle, or for whom it is now a thing of the Past; for such it is only the immediate sensuous representation which is in the first instance seized, and it remains for these in every way a question of doubt, whether they are to rest satisfied with that which lies openly before their eyes, or are to accept these as indicators to yet further imagery or ideas. When, for example, we gaze in Christian churches upon the *triangle* in some conspicuous position on the walls, we at once recognize that the intention is not to place before the view this geometrical figure simply as such, but rather to draw our attention to its spiritual significance. If, however, we were to find it elsewhere we should probably feel equally certain that such a figure had no reference whatever, either as sign or symbol, to the Trinity. On the other hand a folk strange to the ideas which have grown up in Christian countries might easily feel doubts in both cases, and it is by no means easy for ourselves to determine with equal certainty in all cases, whether a figure of this kind is to be understood as presenting us with its literal or symbolical interpretation.

(*b*) Moreover this ambiguity does not merely apply to isolated cases, but extends to vast areas of the entire domain of art, to the content of an almost

unlimited material open to our inspection, to the content in full of all that Oriental art has ever produced. For this reason, as we enter for the first time the world of ancient Persian, Indian, or Egyptian figures and imaginative conceptions we experience a certain feeling of uncanniness, we wander at any rate in a world of *problems.* These fantastic images do not at once respond to our own world; we are neither pleased nor satisfied with the immediate impression they produce on us; rather we are instinctively carried forward by it to probe yet further into their significance, and to inquire what wider and profounder truths may lie concealed behind such representations. In other productions of the same kind it is apparent at the first glance that they are, just like so many fairy tales of children, merely an interplay of pictorial fancy, a strange texture of curiosities woven together at haphazard. For children delight in just such an even surface of pictures, a play of the fancy which makes no demand on effort or intelligence, but is simply a collection tumbled together. Nations on the contrary, even in their childhood, require as the food of their imaginative life a more essential content; and this is just what in fact we find in the figures of Indian and Egyptian art, although the interpretation of such problematical pictures is only dimly suggested, and we experience great difficulty in deciphering it.

Even in the province of classical art we meet now and again with a like uncertainty, though it is the essence of classical art to be throughout clear and intelligible on its own surface without the use of symbolism of any kind. And this clarity of classical art consists in this that it comprehends the true content of Art, in other words substantive[13] subjectivity, and thereby discovers at the same time the true form, which essentially expresses nothing less than this genuine content, so that what it appears to mind, the significance that is of it is just that, which is veritably expressed in the external form, both the ideal aspect and the plastic shape being entirely adequate to each other; in symbolical art, the simile, and other forms of that

kind, the image always brings before perception something in addition to that significance, for which it merely serves as the picture. At the same time classical art, too, presents us with an aspect of ambiguity. In considering the mythological phantasies of antique art it is frequently a matter most difficult to decide, whether we do rightly in taking such plastic figures simply for what they are, contenting ourselves with mere wonder over the wealth and charm, which this happy play of imaginative vigour offers us, for the reason of course that mythology is generally accepted as nothing but an idle collection of fairy tales, or whether on the contrary we have still to seek for a significance of wider range and greater depth. We shall feel the insistence of such a doubt in exceptional force where the content of these fables refers directly to the life and activity of the Divine, in cases, that is, where the stories handed down to us can only be regarded as utterly unworthy of the Supreme Being, indicative of an invention as entirely inadequate as it is in the worst possible taste. When we read, for example, the twelve labours of Hercules, or, to take a stronger case, are informed that Zeus hurled Hephaestus from Olympus on to the island of Lemnos, with the result that Vulcan remained lame ever after, we are no doubt ready to believe that the entire story is nothing but a fairy tale of the imagination. It is just as possible to believe that all the love affairs of Zeus are mere freaks of a prodigal fancy. But, on the other hand, for the very reason that such stories are told about the Supreme Divinity, it is quite equally credible that meaning of more universal import is hidden under that which such myths immediately transmit to us.

With regard to such facts as those above stated, there are two theories current of exceptional importance and contradictory to each other. The one accepts mythology as a collection of stories of purely external significance, which as such could not fail to be unworthy presentations of the Divine nature, though able, when regarded apart from such associations, to reveal

to us much that is finely conceived, delightful, interesting, nay, even of great beauty. They offer us, however, no ground whatever for attempting to enlarge their significance. In this view mythology is in the form in which it is presented purely *historical*: under one aspect, that is, treating it as art, in its shapes, pictures, gods, together with all the practical activities and events it describes, it is amply self-sufficient, or rather by the way it brings before us that which is significant supplies its own elucidation; from another point of view, that is to say, its origin in history, we have to regard it as built up from local claims, no less than the chance caprice of priest, artist, and poet, the facts of history, foreign legends and traditions. The theory which is *opposed* to the above is unable to rest satisfied with the purely external husk of mythological form and narration, and insists on discovering beneath it a meaning of more universal and profounder import, to master which, as it breaks upon the surface, it conceives to be the main object of mythological inquiry regarded as the scientific examination of the mythos. In this view mythology must necessarily be apprehended as bound up with *symbolism.* And by symbolism all that is meant here is just this, that however bizarre, ridiculous, grotesque such myths appear to be, however much the adventitious caprice of a plastic imagination may contribute to their form, they are essentially a birth of Spirit; and in spite of it all contain in them significant ideas, that is, thoughts of universal significance upon the nature of God; they are, in short, *Philosophemes.*[14] In this latter sense the recent work of Creuzer on symbolism is particularly noteworthy; this writer has once more taken up the review of the mythological conceptions of the ancient world, not, as is so frequently the fashion, from the external and prosaic standpoint, or simply with the object of determining this artistic merit, but rather expressly to elucidate the intrinsic rationality of their substance. Such an inquiry proceeds from the presupposition that myths and fabulous tales have their origin in the human spirit, which is capable, no

doubt, of playing freely with its notions of gods, but in its religious interest marks the point where it enters a more exalted sphere, in which reason itself is the discoverer of form, albeit it is charged with the defect of being unable at this early stage to exhibit the core from which it grows with commensurate power. And this assumption is essentially just. Religion discovers its fountain-head in Spirit, which seeks after its truth, dimly discovers it, bringing the same to consciousness by means of any form, which displays an affinity with this form of truth, be it a form of narrower or wider borders. But once grant that it is reason which seeks after such forms, and the necessity is obvious to recognize the work of reason. Such a recognition is alone truly worthy of human inquiry. Whoever shelves this problem makes himself master of nothing but a motley show of unrelated learning. If we, on the other hand, probe into, the truth of mythological conceptions as it presents itself to mind, without at the same time excluding from our grasp that other aspect of them, that is, the haphazard caprice therein exercised by the imagination, and all the external influences, local or otherwise, which have contributed to this creation, we shall then be in a position to justify the various systems of mythology. To justify the work of man in the imagery and forms that are the product of his spirit is a noble enterprise, of rarer worth than the mere heaping together of the external facts of history. The objection has no doubt been pressed against Creuzer that here, treading in the steps of the new Platonists[15], the wider significance he elucidates from the myths is a creation he attaches to them himself; that, in short, he discovers conceptions in them which are not merely without any historical basis to uphold them, but which it can be positively shown he must have first introduced before he could have found them; in other words it is asserted that neither the people of such times nor the poets or priests — although from another point of view emphasis is frequently laid on the occult wisdom of the priesthood — could have possessed any knowledge of

such ideas, which would have been wholly incompatible with the prevailing culture. Such objections, of course, are entitled to their full weight. These peoples, poets, and priests have not, in fact, been conscious of universal conceptions in the particular form of universality which the human mind now discovers at the root of their mythological ideas, in the sense that they could have deliberately clothed such conceptions in the forms of symbolism. And as a matter of fact this is never maintained even by Creuzer. But however true it may be that the reflections of the ancient world over its mythology were entirely different from those of the modern, we are by no means therefore entitled to conclude that the conceptions of its mythology are not essentially symbolical, and as such must be fully accepted; rather our inference should be that in the times when these peoples created the poetry of their myths, from the midst of a life itself steeped in poetry, they would instinctively bring home to consciousness all that was most spiritual and profound in that life in the forms of the imagination rather than that of reflection, and fail to separate conceptions which were more universal or abstract from the concrete creations of their phantasy. That this really was the case is a fact which we have in this inquiry to accept as fundamentally established; we may, nevertheless, be equally prepared to admit that, in such a form of interpretation as the symbolical, theories are apt to slip in which are merely the product of artifice and ingenuity, much as is the case with etymological science.

(*c*) At the same time, however much we may find ourselves in general agreement with the view that mythology, with its tales of the gods and its circumstantial pictures of a persistently poetic imagination, includes within its borders a content, that is to say rational and profound religious conceptions, it is still open to us to ask in our examination of the symbolical form of art whether for the same reason all mythology and art is to be interpreted in a *symbolical sense*, in accordance with that typical assertion

of Friedrich von Schlegel, to the effect that we are bound to look for an allegory in every artistic representation. The symbolical or allegorical is then understood in the sense that a general conception[16] is assumed to underlie every work of art as its motive principle and every mythological form, by bringing the universal character of which into prominence it should then be possible to expound the real significance of such a work or imaginative creation. This mode of treatment is, moreover, very commonly adopted in our own days. We find, for instance, in the more recent editions of Dante a marked tendency to interpret every canto in an exclusively allegorical sense, and no doubt the poetry of Dante contains many examples of such allegories. In the same way Heyne's editions of the classical poets evince the same disposition in their commentaries to elucidate the general significance of every metaphorical expression by means of the abstract conceptions of the understanding. Nor is this to be wondered at; for it is just this faculty which is most ready to seize upon symbol and allegory, while at the same time it separates the sensuous image from its significance, and by so doing destroys the unity of the artistic form, an aspect over which it is, in its zeal for a symbolical interpretation, which aims exclusively at setting the universal characteristic as such in relief, wholly indifferent.

Such an extension of symbolism over every province of mythology and art is by no means that which we have in view in our present consideration of the symbolical form of art. It is not any part of our labours to ascertain to what extent a symbolical or allegorical significance, in this enlarged use of the term, is applicable to the forms of art. On the contrary we shall restrict ourselves entirely to the question how far symbolism itself is entitled to rank as a form of art; and the question is raised in order that we may finally determine the precise relation which subsists between artistic significance and artistic form in so far as such a relation is symbolical and stands in contrast to other modes of artistic presentation, in particular those of the

classical and romantic art-forms. We must consequently endeavour before everything else expressly to limit the field of our review to that portion where we find the symbolical is independently portrayed in its essential character and is open to our consideration as such, rather than attempt to make a symbolical interpretation co-extensive with the entire domain of art. And it is consistently with such a purpose that we have already subdivided the Ideal of art under its respective symbolical, classical, and romantic forms.

In the signification we give to the expression the symbolical disappears at the point where we find that a free subjectivity rather than purely abstract conceptions determines the content of the artistic product. In this case the conscious subject is his own self-assured significance, his own self-manifestation. All that he feels, conceives, does, and perfects, his qualities, his actions, and his character, all this he actually is himself; the entire gamut of his spiritual and sensuous manifestation has no further significance than that of declaring his subjective unity, which, in this process of expansion and development of its own wealth, brings before the eyes of all the man himself as master over the entire field of objective reality thus presented to him, the world in which he discovers his existence. Significance and sensuous presentment, inward and outward reality, fact and picture, are here no longer separate from each other, assert themselves here no longer as merely cognate, the characteristic distinction of the symbolic relation, but rather as a totality, in which the manifestation possesses no other reality, the reality no other manifestation either outside of or alongside with itself. That which declares itself and that which is declared is here posited[17] in its concrete unity. In this sense the gods of Greece, in so far, that is to say, as the art of Greece was able to represent them as free, self-subsistent, and unique types of personality, are to be accepted from no symbolical point of view, but as self-sufficient in their own persons. The actions of Zeus, for

example, of Apollo or Athene are actions appropriated by Art to themselves and only themselves, and must not be allowed to stand for anything but the might and passion of such personages. If we once attempt to abstract from free individualities of this kind some general conception as the essential core of their significance, setting it alongside their concrete particularity as an interpretation of their entire and individual manifestation, we let fall or annihilate all that we have failed to observe, and it is precisely all in these figures which art seeks most to secure. For this reason artists have been unable to take kindly to such symbolical interpretations of all works of art and the mythological figures we find in them. For all that is left us in the sphere of art we have just been considering which is really compatible with an interpretation based on symbolism or allegory only affects subsidiary aspects, and is for that reason expressly limited to the attribute and the representative signs; the eagle, for example, stands by Zeus, an ox is the companion of the evangelist Luke; the Egyptians, on the contrary, beheld in the form of Apis the Divine itself.

The point so difficult to decide in connection with this manifestation of self-conscious freedom, otherwise so appropriate to artistic presentment, is just this, whether that which is placed before us as such a subject really possesses a subjective individuality of the above quality, or only carries the mere semblance of it in the form of a *personified* shadow[18]. In this latter case personality is nothing but a superficial form, which fails to express its vital substance in particular acts no less than bodily form, which would otherwise enable it to penetrate through all that is external in its appearance as its own possession, and instead of this still retains another inwardness for the external reality as its significance, which is not either true personality or subjective freedom. It is precisely at this point that we find the boundary which includes or excludes symbolic art.

Our interest, then, in the consideration of the symbol consists in this, that we recognize thereby that process within itself where we find the beginnings of art, in so far as the same proceeds from the notion of that Ideal which unfolds itself gradually as art in its truth, and while doing so recognizes each stage of symbolical art as successive steps which conduct us to the same consummation. However intimate the connection between religion and art may be we are not here concerned to pass in review either symbols or religion under the range which is co-extensive with the wider signification of the word symbol or emblematical conceptions; we have exclusively to consider that aspect of them, according to which they belong to art in its own right, handing over their religious aspect to the historian of mythology and symbolism.

DIVISION OF THE SUBJECT

In proceeding now to a closer determination of the several divisions of symbolic art it will be necessary, in the first place, to fix the boundary lines within which the development of the successive grades of this type moves forward. Speaking generally, as we have already observed, the entire sphere we have now to define is in principle a *forecourt* of art. We have here, in the first instance, significant conceptions which are purely abstract, which are still in themselves destitute of essential individuality, the immediate artistic presentment of which may be as truly described either as adequate or inadequate[19]. Our first definition of boundary consists, therefore, in determining generally the earliest modes under which artistic perception and representation work themselves out[20] into actuality; on the further side of the line at the other extreme we have real art, in the direction of which symbolic art uplifts itself as to its truth.

1. In discussing the origins of this appearance of symbolic art from the *subjective* point of view, we may draw attention to an observation made previously, that the artistic consciousness, no less than the religious, or rather we should say both in their essential unity, and we may even include the impulse of scientific inquiry, have originated in *wonder*. The man who is still unable to wonder at anything lives in a condition of crassness and obtuseness which is devoid of all interest, in which for him everything is as naught for the reason that he fails as yet to separate or unravel himself from objects around him and their own immediate and independent existence. The man, however, at the opposite extreme, whose wonder is *no longer* excited, is the man who contemplates the entire external world as somewhat which he has made himself clear about. It may be under the abstract conceptions of the commonsense understanding resulting in some general survey of knowledge attainable by the average mind, or it may be in the noble or profounder consciousness of his own absolute spiritual freedom and universality. In either case he has converted the bare fact of such objects and their existence into some spiritual insight of their truth brought home to himself. We may conclude, then, that wonder originates in the condition where we find that man, as conscious Spirit, torn away from his first most immediate association with Nature, and from his earliest and entirely active[21] relation to desire, steps back from Nature and his own individual existence, and seeks after and finds in the objects which surround him a universal, an essential and permanent principle. Then for the first time the facts of Nature astonish him, they become for him an other-than-himself he would fain appropriate, and within which he strives to rediscover his own substance, that is the universal, thoughts, reason. For the dim foretaste here of a higher and the consciousness of the external are still unsevered, and this though a contradiction between the objects of Nature and the Spirit which perceives them is already present, a contradiction in

which these objects appear to repel him quite as much as they attract, and the feeling of which, in the force wherewith they thrust him away, is, in fact, the birth-pang of his very wonder.

The earliest result of this condition of wonder in man's vision of Nature is that on the one hand he sets himself in opposition to Nature and her objective world as a principle[22], and adores her as Power; on the other he is equally possessed with a desire, which craves satisfaction, to render objective to himself his intuition of a higher, essential, and universal somewhat, and to look upon its rehabilitated presence. In this two-fold aspect of his conscious life he is confronted by reality in the following way. The particular objects of Nature, and above all those elementary facts, sea, rivers, mountains, and constellations, are not received by him in the singularity of their immediate presentment to sense, but, carried up into the sphere of imaginative conception, assume for that faculty the form of universal and essentially self-subsistent existence. And we may trace the beginning of art in this, that it reflects these ideas of the imagination thus universalized and essentially independent, in visible representation for immediate perception, and sets them forth for mind in the individual form of the same as objects. The mere adoration of external facts, with its Nature-cult and fetish-cult, is not as yet on this account an art of any kind.

Under the aspect in which it is related to the *objective* world, the beginnings of art are more intimately associated with religion. The earliest works of art are of the mythological order. In religion it is nothing less than the Absolute, which breaks to consciousness through its own impulse[23], though the determinating factors of that consciousness be the most abstract and jejune conceivable. And the earliest *phase in this evolution* of the Absolute is the phenomenal presence of Nature, in whose existence man dimly forebodes the Absolute, and envisages the same for himself in the semblance of natural objects. In this striving Art discovers its source. We

shall find, however, in this very effort art first made visible, not so much where the Absolute is descried by human eyes in the external world which immediately confronts them, a mode of Divine reality in which they rest content, but rather where man's consciousness evolves from its own substance a mode of apprehending what it conceives as the Absolute in the form of a self-subsistent externality, no less than that objective presentation which he unites with it in more or less adequate fashion. For we must remember that Art possesses a substantial content which is grasped by mind (spirit), and which, it is true, appears in external guise, but for all that in a form of externality, which is not merely immediately visible to sense, but is primarily the *product* of *mind* regarded as the existing fact which intrinsically comprehends that content as a whole and then expresses it. Art is consequently and by virtue of its power to create forms cognate with its own substance the *first* interpreter of the religious consciousness; it, in fact, is the first to make the prosaic view of the objective world a thing valid to itself[24], when our humanity has fought itself essentially free as the self-consciousness of Spirit from the immediacy of sense, and sets itself over against the same in the strength of the same freedom with which it accepts and understands that objectivity as simply external fact and no more. This complete separation of the subject and object of sense-perception is, however, indicative of a considerably later phase of man's spiritual history. The first knowledge of truth, on the contrary, declares itself as an intermediate state between the purely unintelligent absorption of the individual in Nature and that spiritual condition which is entirely released from it. This intermediate state, however, in which Spirit merely envisages for itself its conceptions in the plastic forms of Nature's objects because it still fails to master any form of higher significance, although it strives through such association to bring the two aspects of its experience into one homogeneous whole, is, to put it in its general terms, the attitude of art and

poetry as contrasted with that of the prosaic understanding. And for this reason we find that the prosaic consciousness declares itself first in its full bloom, where, as is the case in the Roman and in later times throughout our own Christian world, the principle of the subjective freedom of Spirit is realized in its abstract and actually concrete form.

2. And, *secondly*, the final *aim* toward which the effort of symbolic art is directed, and with the attainment of which the symbolic type is dissolved, is *classical art.* But although we find in this latter form the true manifestation of art's essence first elaborated, it is not the first type of art. Rather it presupposes within its content all the various mediating and transitional stages of the symbolic form itself. It is quite true that the essential aim of that content is to reveal the notion as a rounded and self-defined totality, that is in its concreteness and actuality as the individuality of Spirit; but the notion is only then able to declare itself in such concrete form to conscious life after it has passed through a variety of mediatory stages forced upon it by the abstract conceptions which the nature of its own initial impulse presupposes. It is classical art, however, which brings to a close all the mere preliminary experiments of art in the direction of symbolism and the sublime[25]. And it is able to do this inasmuch as the subjective spirit finds in it, as its essential possession, a form truly adequate to its substance, and in the same way that the self-determining notion creates from its own potency the individual existence that fully expresses it. When once Art has discovered its true content, and by doing so found its true form, its search and striving after both, wherein the defect of symbolical art consists, is therewith at an end.

If we seek further for a closer principle of division of symbolic art within the limits of the boundaries on either extreme hitherto discussed, we shall find the same generally under the modes in accordance with which it contends with the genuine significances of art and their truly appropriate

forms, the battle that is apparent in a content which is still striving in opposition to the truth of art, no less than in a form that is equally inadequate to express it. For both aspects, although externally united in the identity of one creation, are neither brought completely together themselves, nor permeated throughout with the notion of art in its truth; and for this reason they appear quite as much as contestants struggling to be free from the defects of their union. We may, in short, describe symbolic art throughout as a continuous war carried on between the comparative adequacy and inadequacy of its import and form[26]; and the varied gradations of symbolic art are not so much kinds of specific difference as they are stages and phases of one and the same incongruity between the spiritual idea and its sensuous medium.

At first, however, this contention is only potentially present, that is to say the incompatibility of these two sides, whose union is thus affirmed and enforced, is not yet openly present to consciousness. And this is so for the reason that it neither recognizes for itself in its universal nature the import which it seizes, nor is able to comprehend the realized form in its self-subsistent and self-exclusive existence; consequently, instead of representing to the senses both aspects in their *difference*, it is content to proceed upon the immediate appearance of *identity* which it enforces. In this original *point of departure* we have before us the as yet inseparable unity of the art-form and the symbolical expression it seeks after, fermenting, as it were, beneath the association of contradictory elements in mysterious guise — the unity, that is, of the real and primordial symbolism, whose plastic shapes are as yet not *posited* as symbols at all.

The *termination* of this process[27], on the other hand, is the disappearance and dissolution of the symbolic type altogether. The strife which has hitherto been merely implied in it is now brought home to the artistic consciousness. The act of symbolization in consequence becomes the

conscious severation of the transparent significance, which is now recognized for what it is from the sensuous image cognate with it. In this severation, however, there still remains an express relation of reciprocity, which, however, declares itself as such no longer in the mode of immediate identity, but rather as a mere *comparison* between the two, in which that differentiation and separation which in the previous type was not brought clearly to consciousness still remains as conspicuous a factor. And this is the sphere of that symbolism where the symbol is recognized as such. Here we find the artistic import *recognized* and presented in its independent universality, whose concrete embodiment is expressly placed in subordination as an image of that presentment, and no more, and as such a comparative medium is utilized for the purpose of artistic representation.

Halfway between that starting-point above described and this termination of the symbolic type we find the art of the *sublime.* In this the essential import, posited as the universality of Spirit in its absolute self-exclusion, disengages itself in the first place from concrete existence, permitting the same to appear as a mere negative, external and subservient factor beside it, which it is unable to leave, in order that it may express itself in it, standing in its native self-subsistency. Rather it finds it necessary to declare it as that which is essentially defective and self-dissolving, and this, moreover, although it has naught beside as means for its expression than just this to which it opposes itself as external and nugatory. The splendour of this import of the sublime may be accepted in the order of the notional process as previous to that of the mode of genuine comparison for this reason, that the concrete particularity of natural and any other phenomena must necessarily be treated in the first place negatively, merely appropriated, that is to say, as the adornment and embellishment of the unreachable might of Spirit's absolute significance, before that express severation and discriminating comparison of external shapes cognate with,

and yet at the same time distinct from, the import, whose image they reproduce, can assert itself.

3. The three principal stages[28] above indicated break up naturally on closer inspection into the following subdivisions we now summarize in the chapters which include them.

FIRST CHAPTER

A. The *first* stage which presents itself in this portion of our subject-matter is as yet neither to be described strictly as symbolical, nor as belonging strictly to art; it rather clears the road to both. It is the sphere of the immediately cognized and substantive unity of the Absolute regarded as spiritual significance with its unsevered sensuous existence in a form presented by Nature.

B. In the *second* stage we pass to the symbol in its real sense; the dissolution of the first unity above described here commences, and while, on the one hand, the significances assert themselves in their independent universality above the particular phenomena of Nature, on the other they are necessarily forced with a like insistency to present themselves to consciousness together with this preconceived universality in the concrete form of natural objects. In this primary and twofold struggle to spiritualize Nature, and to present that which is born of Spirit to sense, at this stage of the conflict between them, we meet with all the ferment and wild, tossed hither and thither medley, the entire fantastic and confused world that is to say of symbolic art, which half surmises, it is true, the incongruity of its manner of shaping, yet is unable to remedy the same save through the distortion of its figures, while straining after a purely quantitative sublimity that would fain devour all limits. In this phase consequently we find ourselves in a world steeped with poetic phantasies, incredibilities and miracle, yet fail to encounter one work of genuine beauty.

C. Owing to this strife between the spiritual significance and its sensuous presentation, we are conducted *thirdly* to the stage we may describe as that of the true symbol, on which the symbolic *work of art* for the first time appears in its complete character. The forms and shapes are here no longer those present to sense, which, as we saw on the first mentioned stage, were immediately coincident with the Absolute as their positive existence, without any further modification at the hands of art; neither, as in the second phase, are they intent on asserting their unreconciled material against the universality of the significance merely through extensions of the quantitative limits of Nature's objects, the ebullitions of a rioting fancy. Rather the symbolic form, which is here throughout apparent, is Art's own creation, a work not merely capable of expressing its own individuality, but from another point of view possessed with the power of presenting at the same time both the particular object that it is and the further universal significance with which it is associated, and which it thereby discloses to the mind, so that these very shapes stand before us as problems which we are imperatively called upon to unriddle and probe to the inward charge which they carry.

We may at once further venture the general remark with reference to these more clearly defined types of a symbolism still to be ranked as elementary that they spring from the religious attitude to existence of entire nations; for which reason it will form part of our plan to recall their position in history. Not that complete identification of specific types with a given period is wholly feasible. Rather it would be truer to say that particular modes of conception and presentation, when we refer them generally to some kind of artistic type, are mingled up together, so that we find the specific type, which we have reason to regard as the fundamental one in any particular nation's general view of existence, exemplified both in earlier and later peoples[29], though its repetition may only be discovered in subordinate

and isolated cases. In general, however, we may say that we possess the more concrete manifestations and visible proofs of the first stage in the ancient *Persian* religion of the second in the *Indian*, of the third in that of *Egypt*.

SECOND CHAPTER

In the second chapter that significance, which has hitherto been more or less obscured by its particular sensuous form, has at last wrested its way to freedom, and its independent character is brought clearly to consciousness. With this victory the relation of real symbolism is dissolved; we have instead, through the way in which the absolute significance[30] is cognized as the universal *substance* interpenetrating the entire extension of the visible world, the art of the absolute essence[31] in the form of a symbolism of the *sublime*; and this now takes the place of purely symbolical and fantastic suggestions, deformities, and riddles.

We have here mainly two points of view to distinguish which are based upon differences in the relation of the substantive essence, that is the Absolute and Divine, to the finitude of the apparent. Or rather we may say that this relation is capable of being twofold, both *positive* and *negative,* although in both forms, inasmuch as it is in either case universal substance, which has to appear, it is not the particular form and import of the objective facts, but their general principle of animation and their position relatively to this substance which is made visible to sense.

A. In the first phase or type this relation is so conceived, that substance, here the All and the One delivered from every form of particularity, is immanent in the determinate phenomena as the animating principle which brings them into being and is their life; and moreover, it is affirmatively and immediately present to the vision in this immanence, and is comprehended,

and made the object of representation by the individual who surrenders himself to its presence through the adoring self-absorption in this indwelling essence of the entire world of contingent and material things. In this point of view we have the art of the Pantheism which possesses the Sublime as its inherent principle, an art such as we find it in its elementary stage in India, then elaborated in all its splendour in Mohammedanism and its artistic mysticism, and finally with still profounder significance reappearing in certain manifestations of Christian mysticism.

B. The *negative* relation on the other hand of true Sublimity we must look for in *Hebraic* poetry. In this poetry of the Glorious, which is only concerned to celebrate and exalt the unimaginable Lord of the heavens and the earth that it may employ His entire creation as the passing instrument of His Power, as the messengers of His Glory, as the delight and ornament of His Greatness, this service of His Creation, be it never so magnificent[32], is deliberately posited as negative, and this for the reason that it is unable to discover any adequate or positively sufficient expression for the Power and Dominion of the Highest, and is only able to attain a genuine satisfaction by means of the subjection of the creature, which in the feeling and admission of its unworthiness is alone able with adequacy to express its insignificance[33].

THIRD CHAPTER

Through this independent self-assertion of significance, made thus transparent to consciousness in its isolated simplicity, the *severation* of the same from the imaged appearance, whose incommensurability over against it has already been accepted, is now essentially complete; and albeit, along with the fact of this conscious separation, both form and import may still persist in the relation of an intimate affinity, a necessity which is implied in the fact of their being symbolical art, yet this relation no longer attaches to

either import or form, but is placed now in a *third* mode of conception, which according to its own point of view, carries relations of similarity with both these sides[34], and in reliance on these relations makes visible and declares the independently transparent significance by means of the cognate and particular image.

Owing to this change the image, instead of remaining as it was previously the unique expression of the Absolute, becomes now merely an ornament, and we thereby discover a relation which ceases to correspond with the notion of beauty. In other words image and significance, instead of being moulded one within the other, confront each other as opposites, precisely, in fact, as was the case in genuine symbolism, though then the process remained incomplete. Consequently works of art which are based on this form are of subordinate rank, and their content is unable to comprise the Absolute itself, and is necessarily restricted to circumstances and occurrences of narrower range. For this reason the forms which are now under discussion are for the most part merely used occasionally and by way of diversion.

More closely considered we have in this chapter to distinguish between three principal stages of our process.

A. To the *first* we appropriate those types of presentation commonly known as *Fable*, *Parable*, and *Apologue.* In these the severation of form and significance, which constitutes the characteristic trait of the entire sphere to which this chapter refers, is not as yet *expressly* recognized; that is to say, the *subjective* aspect of the comparison is not yet fully *emphasized*; consequently also the representation of the particular and concrete phenomenon, through which the universal significance is finally to declare itself, still remains the *predominant* factor.

B. In the *second* stage, on the contrary, the universal *import* asserts its independent mastery over the elucidating form, which now appears merely

as *attribute*, or, under the guise of an image, capriciously selected by the mind which makes the contrast. To this type belong the *Allegory*, *Metaphor*, and *Simile*.

C. In the *third* stage we meet with the visible and complete *collapse* of those related aspects in the symbol which previously had either been immediately joined in union, despite the fact of their relative incongruity, or in their independent severation had still persisted under a relation of affinity[35]. Out of this arises that form of content which is cognized as independent in its prosaic[36] universality, to which the art-form has become wholly an external relation; on the one hand we find it represented by the *didactic* poem, on the other that very aspect of its external form is accepted for what it is, and exemplified in so-called *descriptive* poetry. Here we find that every association and relation of symbolism has vanished; we have to look round us for some more comprehensive union of form and content, and one more truly adequate to the notion of art.

[5] So the French expression *des couleurs*, and our English "the colours."

[6] Hegel uses the 'technical term *Inhalt* in this passage to signify either (*a*) the quality of significance, or (*b*) the object which is symbolized by virtue of some selected quality. The use of it in both senses makes the passage somewhat difficult to follow.

[7] *Inhalt* here evidently is the abstract quality.

[8] Necessarily because such ambiguity is implied in the idea (*seinem Begriff nach*).

[9] This, I think, is the sense. The language literally is, "Which a form under several possible significations, as symbol of any of which (*deren*) it can be employed often through connecting links (*Zusammenhänge*) more remote, may be taken to symbolize."

[10] The German words are *Begreifen* and *Schliessen*, which in their original sense are "to grasp with the hand" (*prehendo*) and "to shut" or "lock up." The English words in a still fainter form carry the

same significance through the Latin language. The symbolism of language at this stage is obviously only apparent to the student of language.

[11] That is, more abstract.

[12] Or in English: /# Forth on the ocean is shipped Youth with his thousand sails: Silent in bark barely saved steals into harbour old age. #/

[13] *Substantielle*, that is, an artistic consciousness which is aware of its own essential nature — Spirit, and the object of pure intelligence — the Ideal.

[14] Perhaps we should rather say a Theosophy.

[15] The Alexandrine School, of which Plotinus and Philo are leading names.

[16] *Ein allgemeiner Gedanke.* The reference throughout this paragraph to the universality of the ideas of reflection as contrasted with the sensuous image is rather a reference to the abstract conceptions of the analytical mind, that is, which are usually understood as universals in the sense of generic conceptions, than any fuller grasp of concrete reality such as possesses a truly ideal significance. So in its application to the metaphor I imagine what is meant is that we have here the process of dry analysis which merely destroys its significance as metaphor, that is, its synthetic unity for our aesthetic sense.

[17] *Ist aufgehoben*, here not in the sense of being cancelled, but raised to the expression of concrete unity.

[18] *Als blosse Personification*, that is, an individualization which impersonates the subjective identity without possessing its concrete substance, a personified shadow like the sphinx. Such appears to be the sense.

[19] Because the content for which such shapes (*Gestaltung*) are given is itself incoherent, and therefore incompatible with adequate expression.

[20] *Sichhervorarbeiten.* Our word "elaborate" is here insufficient. Hegel means the mode in which the Idea of art works itself free from entirely potential obscurity into a living force, a real *energeia.* We cannot say "emerges into daylight," however, because the highest grasp of symbolic art is still only a twilight. It is like the growth of the plant-germ, still underground, or partially so.

[21] *Pracktischen.* Not matter-of-fact relation, but rather a relation that asserts itself exclusively in action.

[22] *Als Grund*, that is, as a fundamental unity of the real.

[23] *Die erste näher gestaltende Dollmetcherin*, lit., the first interpreter which supplies forms more nearly cognate with itself.

[24] It is valid (*geltend*) because it introduces there its own spiritual nature.

[25] The previous statement of Hegel must not be overlooked, however, and it may be considerably amplified, that there is much in romantic art which is related to symbolism and the sublime. Take the case of the celebrated sculpture of Michael Angelo typifying Night, Day, Dawn, and Twilight, or such modern pictures as those of Watts's "The Minotaur" and "The Spirit of Christianity."

[26] Or rather "between those aspects of its import and form which are reciprocally homogeneous and those which are not."

[27] This process of symbolic art.

[28] *Hauptstufen.* The word signifies either the phase or grade of a process of development, or to take the metaphor used by Hegel above (*Stadien*) may perhaps be better translated by "stage," as though indicating the successive stages of a journey.

[29] I think *Völkern* rather than *Zeiten* must be here understood, and the sense appears to be that the confusion indicated refers to a mingling of forms appropriate to a nation in one historical period with those that are more cognate with a people at any earlier or it may be later period. But unquestionably this attempt to identify a type as between different nations with historical periods that will harmonize with Hegel's own classification is a difficult matter as we may see by the fact that Egypt, the oldest example of all, represents the third stage. On the other hand, if the confusion referred to is applied to the particular development of any one people, the examples given by Hegel do not bear on the difficulty they illustrate.

[30] Or rather "the import of the Absolute."

[31] *Substantiality*, called below *die Substanz*; the word signifies the real essence of the Absolute.

[32] The principal clause of this sentence has no end as printed. The auxiliary must be omitted either before *in diesem Dienste* or *eine positive.* I prefer the first alternative.

[33] The relative here agrees, I think, with *die Dienstbarkeit* rather than *die Kreatur* or *die Poesie.* Hegel says "compatible with itself and its significance," we should rather say "its sense of its own insignificance."

[34] Hegel's words are *sondern in einem subjectiven Dritten*, *welches in beiden Seiten nach seiner subjectiven Anschauung*, etc. This "subjective third" is, as explained below, the way in which the relation between the image and the absolute significance ceases to be regarded as identical.

[35] This sentence as it stands is ungrammatical; there is a change in the construction as it proceeds.

[36] The prosaic universality is the prose of its form separated from content. It is prosaic because it is unrelated to the vitality of the notion.

CHAPTER I

UNCONSCIOUS SYMBOLISM

NOW THAT WE pass to the consideration of the several distinctions of symbolical art in more detail, we have to make a beginning with the identical beginning of art as it proceeds out of the notion of art itself. This commencement, as we have seen, is the symbolical form of art in its still immediate form wherein the appearance, as purely image or likeness, is neither brought to consciousness nor presupposed — *unconscious symbolism*, that is to say. Before, however, we shall be in a position to consider this form in its genuine symbolical character, it will be necessary to review several presuppositions which the notion of symbolism itself determines in order that we may utilize them for the basis upon which the symbol may unfold itself for scientific apprehension.

The point from which we make a start may be defined more closely as follows:

The fundamental root of the symbol is, regarding it from one aspect, the immediate union of the universal and thereby spiritual significance with the form which may at the same time be described as adequate and inadequate, an inadequacy, however, which is as yet unperceived. This association, however, must, on the other hand, receive a form from the *imagination* and *art*, and must not *merely* be conceived as a Divine reality exclusively immediate to sense. By this means the symbolical originates in the first instance with the *severation* of a universal import from the immediate *presence of Nature*, in whose existence the Absolute is contemplated as actually present. These two aspects supply us with the preliminary stages for the genuine forms of symbolic art.

The *first* presupposition consequently — we may call it the coming into being of the symbolical — is not that union which is the product of art, but rather just that immediate unity of the Absolute and True and its existence, which is discovered in the visible world apart from art's mediation.

A. IMMEDIATE UNITY OF SIGNIFICANCE AND FORM

In this identity of the Divine immediately envisualized, a Divine, which is brought home to consciousness as the union of its determinate existence in Nature and humanity, Nature is neither taken simply for that which it is in isolation by itself, nor is the Absolute severed from it and posited in an independent self-subsistence. Consequently it is wholly beside the point to speak of a distinction here between the Inward and the External, the significance and the form, and this for the reason that the Inward is not as yet released in its independence as significance from its immediate reality in the object of sense. When we apply here the expression import[37], such merely emphasizes our *own* reflection upon it, which is due to the necessity for ourselves personally to regard the form, which contains that which is spiritual and inward under the mode of sense-perception, generally as something external to us, through which we are desirous of penetrating into the Inward, that is, its animating life and significance, in order that we may understand it. For this reason we are under the necessity from the very first, when dealing with such general impressions of sense-perception, of making an essential demarcation between those cases in which the peoples, who in the first instance experienced them, themselves were clearly conscious of this Inward itself as such, that is, as a spiritual significance, and those in which the use of such expressions is only applicable to ourselves, who now and only now recognize an import of this kind in the content of that external expression of sense-envisagement.

In this primary unity such as the latter cases involve, there is no such distinction between soul and body, notion and reality, as is implied in the former. That which we describe as corporeal and sensuous, natural and human, is not merely an expression for a significance which proceeds at the same time to a point of distinction from it[38]; but the phenomenon is itself conceived as the immediate reality and presence of the Absolute, which does not in addition possess some other mode of self-subsistent existence, but is confined exclusively to the immediate presence of an object of sense, which is God or the Divine. In the service of the Lama, for example, this particular, actual human being is immediately known and adored as God, just as in other natural religions the sun, mountains, rivers, the moon, particular animals, such as the bull, ape, and so on, are looked upon as immediately Divine existences and worshipped as sacred. We may observe a similar directness, if under a mode of profounder application, even now in many aspects of the Christian consciousness. According to Catholic doctrine, for example, the consecrated bread is the real body, and the wine the real blood of God, and Christ is immediately present therein; nay, even according to the Lutheran faith, both bread and wine are converted into such real body and blood by virtue of the faith of the recipient. In this mystical union it is not merely a symbolism which is expressed, a point of view which comes into prominence as the result of it for the first time in later doctrines of the reformed Church, where we find as a result the spiritual significance is expressly severed from the sensuous object, and the external medium is then accepted as merely pointing to an import which is distinct from itself. In the same way the power of this Divine is held to operate in the miracle-working images of the Virgin as a Divine force that is immediately present within them, and not merely under symbolical guise through the significant import of such pictures.

We find, however, the most thorough and universal exemplification of this absolute and immediate unity of sense-perception in the life and religion of the ancient Zend-people, whose conceptions and institutions are preserved for us in the Zend-Avesta.

1. In other words the religion of Zoroaster beholds Light in the form of its natural existence, the sun, stars, and fire in the luminous activity and flames which proceed from them, actually as the Absolute, without separating this Divine independently from that Light either as its expression and image or the sensuous medium thereof. The Divine, the significance, is not thus severed from its determinate existence in the form of lights, however displayed. For even when light is accepted here in the sense of Goodness and Justice, and through such significance is extended to all that is rich in blessing, support, and life, it is still not taken as the mere image of such things, but Light is itself the Good. And the same view applies to the opposite of light, namely, obscurity and darkness when identified with that which is unclean, hurtful, evil, destructive, and deadly.

This point of view may be more closely defined and considered as follows:

(*a*) In the first instance the Divine, as the essential purity of Light[39], and the Darkness and Unclean are, it is true, *personified* under the names of Ormuzd and Ahriman respectively. This personification is, however, throughout entirely superficial. Ormuzd is no essentially free individuality devoid of all relation to external objects[40] as was the God of the Jews, or truly spiritual and personal as is the God of Christianity when conceived as truly personal and self-conscious Spirit; rather Ormuzd, despite the fact that he is described also as king, great spirit and judge, remains inseparable from such external existence as Light and its illuminations. He is exclusively this universal characteristic of all particular existences, in which light and thereby the Divine and Pure are realized, without any additional power to

withdraw himself in a spiritual universality and independence into his own substance from that which is thus immediately presented. His consistence rests in the particular facts of existence precisely in an analogous way to that of the genus in the species. It is true that regarded as this universal he is superior to all that is wholly particular, and is the first, most supreme, the kings of kings glorious in his gold, the purest and so forth; but he retains his existence none the less exclusively in all that is luminous and pure as Ahriman in all that is obscure, evil, destructive, and charged with disease.

(*b*) As a result this mode of vision is at the same time extended to the conception of an *empire* of light and darkness, and the strife between these forces. In the empire of Ormuzd it is in the first place the Amschaspands, as the seven principal lights of heaven, which receive adoration as Divinity, inasmuch as they are the essential particular existences of Light, and for this reason constitute as a pure and spacious empeopled heaven, the existence of the Divine itself. Every Amschaspand, to which Ormuzd belongs, has assigned to it days of precedence, blessing, and beneficence. The Izeds and Ferners carry the conception still further into specification, which it is probable enough are personifications of Ormuzd himself, albeit they add to him no further shape that we may envisage as human, so that neither the spiritual nor the bodily mode of subjectivity, but simply the existence as light, appearance, illumination, splendour, remains the essential characteristic of the object envisaged.

In the same way also the particular objects of Nature, which themselves do not exist in external form as lights and luminous bodies, such as animals, plants, and so forth, no less than the forms which characterize the human world, whether we view it under its spiritual or bodily presentment, in other words the particular activities and conditions of it, the entire life of the state, the king with the seven great men who support him, the division of classes, cities, the various provinces with their governors, all that is

warranted by experience as typical of the best and purest for the protection of the rest — the entire reality, in fact, of this life is regarded as an existence of Ormuzd. For everything that carries within itself and promulgates what has solidity, life, and substance is an existence of Light and Purity, and consequently an existence of Ormuzd; every particular truth, excellence, love, justness, every individual example of life, beneficence, protection, spiritual power and enjoyment or benignity is, according to Zoroaster, regarded as essentially Light and Divine. The empire of Ormuzd is the Pure and Illuminating of visible reality; and conformably to this there is no distinction between the phenomena of Nature or Spirit, just as Light and Goodness, the spiritual and the sensuous quality, are inseparably blended in the conception of Ormuzd himself. The *splendour* of a creature is consequently for Zoroaster the very substance of spirit, force, and life-exhalations of every kind, in so far, that is, as they tend to actual conservation and to the removal of everything positively evil and hurtful, for that which is the Real and the Good, whether in beast, man, or vegetable life, is Light, and it is according to the measure and mode of display of this luminousness that the relative power or weakness of the splendour of all objects is determined.

An articulation and graduated division of similar character is found in the empire of Ahriman, merely with the difference that what is spiritually or naturally evil, and generally the destructive and actively negative principle asserts itself in actual masterdom. But the might of Ahriman must not be suffered to spread; the aim of the entire world is consequently assumed to be that of annihilating the Empire of Ahriman, in order that the life, presence, and dominion of Ormuzd may prevail throughout creation.

(*c*) To this exclusive object the entire life of humanity is consecrate. The life-task of every man consists exclusively in a purification of soul and body, and in the extension of this blessing and this conflict with Ahriman

throughout all the conditions and activities of the life of man or Nature. The highest and most sacred duty is consequently to glorify Ormuzd in his creation, and to love, honour, and conform oneself to all that proceeds from his Light and is essentially pure. Ormuzd is the beginning and end of all adoration. Above all else the Parsee is moved to summon the life of Ormuzd in thought and speech; he is the main object of his prayers. And in the exaltation of him, from whom the entire world of the Pure has streamed in its splendour, the devotee is in duty bound to accommodate his adoration of particular objects according to the measure in which they proclaim his majesty, worth, and perfection. So far as they are good and ring sound, to that extent, the Parsee reasons with himself, is Ormuzd alive within them; he loves them as the children of his purity, yea, rejoices over them as in the beginning of his substance, forasmuch as through him was everything brought forth in newness and purity. And for the same reason is all prayer directed first and foremost to the Amschaspands as the most intimate reflections of Ormuzd, as the primates of supreme splendour who surround his throne and advance his dominion. Such prayer to these heavenly spirits is immediately directed to their qualities and activities, and in the case of stars at the time of their uprising. The sun is invoked by day, and always with the changes appropriate to his own motion through sunrise, noonday, or sunset. From morning till noonday the devotion of the Parsee centres in this that Ormuzd may exalt his splendour; at evening he prays that the sun may through Ormuzd and the protecting care of every Tzed perfect the course of his life. But principally we find honour paid to Mithras, who, as the fruit-bringer to the Earth and the wilderness, pours forth the fermenting sap over all Nature, and as mighty champion against all the Devas of contention, war, confusion, and destruction, is the author of peace.

In addition to this the Parsee, in his generally single-toned songs of praise, exalts his ideals, that is, the purest and most veritable examples of

human life, the Ferver conceived as pure human spirits, on whatever portion of the Earth's surface they live or have lived. In the chief place prayer is offered to the pure spirit of Zoroaster, and after him to the leading lights of all classes, cities, and provinces; and already in this religion, we find that the spirits of all mankind are contemplated as united together with a sufficient bond in that they are members in the living association of Light, which hereafter in Gorotman shall receive a yet more perfect union.

Finally, not even the animals, mountains, and vegetable world are forgotten, but are appealed to as embodiments of Ormuzd; all that is good and serviceable in them to mankind is extolled, and especially the first and most excellent of its kind is adored as the present existence of Deity. And over and above this worship of Ormuzd and of every form of selected excellence among the pure and beneficent objects of his creation the Zend-Avesta is insistent upon the *practice* of goodness and the purity of thought, word, and deed. The Parsee is to be in the entire display of his external and inward man as Light, as Ormuzd, the Amschaspands, and the Izeds, as Zoroaster and all good men live and do. Such live and have lived in the Light, and all their deeds are Light; therefore shall every man make them an example to his eyes and follow after the same. The more purity of light and goodness man expresses in his life and accomplishment, the nearer he stands to those spirits of heaven. As the Izeds throw the blessing of their beneficence over everything, are a source of life and fruitfulness and friendship, so, too, he must seek to purify Nature, to ennoble her, and to reach abroad the light of life and the joy of plenteousness. In accordance therewith he shall feed the hungry, tend the sick, offer the drink of consolation to the thirsty, give roof and shelter to the wanderer, provide pure seed for the Earth, delve clean channels of water, plant the waste with trees, nourish to the best of his power their growth, care for the sustenance and fructification of things alive, keep pure the lambency of fire, remove

from sight the dead and unclean beast, establish marriages, and in the doing thereof the holy Sapandomad, the Ized of the Earth, herself rejoices, averting the harm which the Devas and the Darvands are busy to prepare.

2. If we ask ourselves once more, after this delineation in outline of the fundamental conceptions of this system, what is the symbolical character of the same there can be but one reply, namely, that there is no trace here of anything we have previously described as symbolical. On the one side, no doubt, we have light in its obvious natural form, and on the other it possesses the further significance of all that is rich in goodness, blessing, and permanence. It is, therefore, possible to contend that the actual existence of light is merely an image cognate with this universal significance, which interpenetrates every part of the world of Nature and mankind. If we apply such an interpretation to the conception of Parsees themselves we shall find such a separation of existence and its import to be false; for these the Light as Light is actually the Good, and is so apprehended that it is in the form of light present and active in everything that is good, vital, and positive. The universal and Divine is carried no doubt through the distinctions of the world of particular objects, but in this its differentiated and particularized existence, the substantial and inseparable unity of import and form remains constant, and the distinctions that are involved in this unity do not affect the difference of significance *quâ* significance, and its manifestation, but only the distinguishing features of particular objects, such as stars, organic life, human opinions and actions, in which the Divine as Light or Darkness is immediately open to sense.

In the further embrace of such conceptions there are no doubt points of connection with incipient symbolism, but we get out of them no real type of that mode of viewing things in its completeness; they will only pass muster as isolated traits in its direction. To such effect Ormuzd is on one occasion made to say of his beloved one Dschemschid: “The holy Ferver of

Dschemschid, the son of Vivengham, was great before me. His hand received from me a dagger, whose sharpness was gold, and whose shaft was gold. Therewith Dschemschid marked out three hundred portions of the Earth. He split up the Earth-realm with his gold-plate, yea, with his dagger and spake: 'Let Sapandomad rejoice.' He spake the holy word with prayer to the tame cattle and the wild and unto men. So his passing through was happiness and blessing for these lands and animals of the home and the field, and men ran together into great dwellings." Here we find in the dagger, and the cleaving of the Earth-soil an image which may be interpreted as significant of agriculture. Agriculture is still no essentially spiritual activity, and just as little is it a purely natural one; it is rather a universal occupation of mankind, which results from reflective thought and experience, and which has point of association with all the relations of life. It is no doubt never expressly stated in this conception of the passing of Dschemschid that this splitting of the Earth with the dagger indicates agriculture; nor is there a single word added of any increase of the fruits of the field by virtue of this division; for the reason, however, that in this particular act more appears to be included than the mere turning over and loosening of the soil, we are led to look for a further significance beneath it. The same observations apply to more recent conceptions, such as we find exemplified in the later elaboration of the worship of Mithras, where Mithras is represented as a youth who in the dusk of a grotto raises on high the bull's head and plunges a dagger in his neck, whereon a serpent licks up the blood, and a scorpion gnaws his genitals. This symbolical account has received an astronomical and other interpretations. We may, however, find in it a still more universal and profounder meaning, and take the bull generally to personify the principle of Nature, over which man, as essentially spirit, secures the victory, and this though astronomical associations may also be implied in it. That, however, such a revolution as

the victory of Spirit over Nature is contained in it is also suggested by the name of Mithras, or mediator, more especially if we refer it to a later period when such uplifting over Nature was already a necessity present to the national consciousness. Symbols such as the above, however, as already observed, only incidentally come to the fore in the conceptions of the ancient Parsees, and do not in any way constitute a principle for their fundamental type of thought.

Still less can we describe the cultus, which the Zend-Avesta inculcates, as one of symbolical tendency. We find no trace here, for example, of symbolical dances in celebration or imitation of the interlaced revolutions of the stars; as little any other forms of activity which may pass as the suggestive counterfeit of universal conceptions; rather all actions which are prescribed to the Parsee as imperative in a religious sense are matters directly concerned with the actual enlargement of his purity, either of soul or body, and appear as directed with one intent and one object of realization, namely, that of increasing the actual dominion of Ormuzd over men and the objects of Nature, an object consequently which is not merely symbolized in such activity, but entirely carried out.

3. For the reason, then, that a genuine symbolic type fails absolutely when applied to this religious system, it is equally destitute of a true *artistic* character. No doubt we may generally describe its mode of conception as *poetical* for the particular facts of Nature are just as little as the particular sentiments, circumstances, acts, and affairs of men treated in their immediate and consequently haphazard and prosaic relation which is void of all significance, and are rather contemplated essentially in the Absolute as very Light; or to put it the other way, the universal essence of the concrete reality of Nature and mankind is not conceived in the universality which is without existence or form, but this universal and that particular is envisaged and expressed in immediate union. Such a mode of viewing

existence may possibly claim a certain beauty, breadth, and largeness of its own, and in contrast to gross and senseless idols Light is no doubt as the essentially pure and universal element, an adequate image of Goodness and Truth. But for all that we find that poetry here fails to pass beyond a general conception; it never reaches either art or the works of art. For the Good and the Divine are neither essentially defined, nor is the consistency and form of this content a creation of mind (Spirit); but rather, as we have already found, the thing which is immediately present to sense, namely, the actual sun, stars, fire, organic nature, throughout its vegetation, animal and human life, is conceived as the appropriate form of the Absolute in this its existent and *immediate* shape. The sensuous representation is not, as Art requires, the plastic product of mind, shaped and discovered by the same, but immediately identified with and expressed by the external existent shape as its appropriate counterfeit. It is quite true, in another aspect, the particular thing is, by means of the imagination, also fixed in an independent relation to its reality, as, for instance, in the Izeds and Fervers, that is, in the genii of particular men; the poetic invention, however, discovered in this incipient severation is of the weakest kind for the reason that the distinction remains entirely of a formal character, so that the genius, Ized or Ferver, neither includes nor is able to include any real characteristic content of its own, but, instead of this, either repeats one identical content or possesses nothing more than the purely empty form of the subjectivity, which the existing individual already possesses. The product of the imagination here is consequently neither an other and profounder significance nor the self-subsistent form of an essentially richer individuality. And when we moreover find particular objects envisaged on the wider plane of general conceptions and generic types, to which, as appropriate to such types, the imagination vouchsafes a real existence, even here also this uplifting of multiplicity into the sphere of an all-comprehending and essential unity,

regarded as the basic core and substance of the individuals that constitute the same species and genus, can only in a yet more indefinite sense be accepted as an activity of the imagination, no real exemplification of either poetry or art. So we have, for instance, in the holy fire of Behram the essence of fire; and in the same way there is a water that underlies all existent water. So, too, Horn is esteemed as the first, purest, and most stalwart among trees, the primordial tree from which the life-sap full of immortality flows; and among all mountains Albordsch, the sacred mountain, is set before us as the primaeval root of the Earth, erect in the splendour of the Light, from which the good deeds of all men proceed, who have possessed the knowledge of Light, and on whom the sun, moon, and stars repose. In general, however, we may affirm that the universal is visibly known in immediate union with the actual objects of sense, and it is merely now and again that universal conceptions are embodied in the particular image.

In yet more prosaic fashion does the cultus of this religion make as its principal object the dominion of Ormuzd a reality which interpenetrates all things, merely requiring this one essential condition to the adequacy of every object, namely, its purity, and without attempting therewith to construct from such any existent form of art that is based upon immediate life, as, for example, the warriors and wrestlers of Greece were so ready to do in their artistic elaboration of physical perfection.

From whatever side, then, or whatever may be the point of view from which we regard this first unity of spiritual universality and sensuous reality, we only get from it the *basis* of symbolical art; it still fails to possess a real symbolism of its own, and is unable to produce works of art. In order that we may attain this object, which is the next in view, we must pass away from the union we have just considered, and examine modes of conception

where the *difference* and *conflict* between significance and form is more really emphasized.

B. FANTASTIC SYMBOLISM

Quitting now the sphere of thought in which the identity of the Absolute and its externally envisaged existence is immediately cognized, we have, as an essential determination to start from, the severation of these two aspects hitherto united, a *cleavage* which stimulates the effort to restore once more the visible breach by means of an elaborate fusing together of the whole thus divided by a rich use of the images of phantasy. With this attempt the essential need for art is felt for the first time. No sooner has the imagination succeeded in holding fast its envisaged content, which is no longer grasped in immediate union with the objects of sense, in isolated separation from that existence, than for the first time spirit is confronted with the task of reclothing with the material of phantasy for sensuous perception, that is, under the renewed mode of a spiritual product, these general conceptions and of creating through this activity the shapes of art. And for the reason that in the stage of our process where we now find ourselves, this task is capable of only a symbolic solution, we may easily fall under the impression that we stand already in the sphere of genuine symbolism. This, however, is not the case. What immediately faces us here are the forms of a fermenting phantasy[41], which in the restlessness of its fantastic dreams merely indicates the path which conducts us to the real centre of symbolical art. In the first appearance of the distinguishing relation between significance and the mode of its presentation, both the severation and the association are still grasped in a confused manner. This confusion is necessitated by the fact that neither of the parted aspects of difference have as yet attained a totality, capable of emphasizing the precise point in the

process, which will serve as the fundamental determination of the opposed side in it, and by means of which for the first,time a really adequate union and reconciliation is rendered possible. Spirit (mind), to illustrate our difficulty further, determines by virtue of its own totality the side of the external phenomenon out of its own essential substance quite as really as it does its own spiritual content for the obvious reason that the essentially complete and independent phenomenon only receives its adequate form as the external existence of that which is spiritual. In the case, however, of this primary severation of the significances apprehended by mind, and the existent world of phenomena such aspects of significance are not those of concrete spiritual life, but abstractions, and this expression also is entirely destitute of spiritual intension, and is consequently, in an abstract sense, purely external and sensuous. This twofold impulse in the direction of disunion and union is for the same reason an unsteady gait[42], which ranges from the objects of sense in undefined and unmeasured waste immediately to the aspects of universal import, and is only able to discover for the inward content of consciousness the absolutely opposed form of sensuous shapes. And it is this very contradiction which is set forth as a means of really uniting elements which contradict each other. The result is that instead of so doing it is first driven from one side of the opposition into the other, and then again is hurled in its ceaselessly alternating dance into the former extreme, while it believes that in this rocking to and fro of its strain it has found the means to lull itself to repose. Instead of getting, therefore, a true satisfaction we have the *contradiction* merely affirmed as its genuine resolution, and in addition the union most incomplete of all is set forth as that which art really requires. We must not therefore expect to find in such a field of confusion worse confounded the true forms of beauty. In this restless leap from one opposed extreme to the other all that we find from one point of view in the sensuous material that is absorbed, regarding the

same in its singularity no less than as it constitutes its elementary appearance to sense, is that the breadth and potency of every import of universality is associated therewith in what must consequently be a wholly inadequate way. From another aspect that which is most universal, as soon as the process has passed from the same, is shamelessly plunged under the reverse treatment into the very heart of the sensuous present; and if any feeling of the incompatibility of such an effort is consciously perceived, the imagination here is only capable of rendering assistance by means of distortions which carry the particular shapes over and beyond their own secure boundaries, adding to their extension, making them ever more indefinite, by an imaginative leap which mounts to the immeasurable, breaks up every bond of union, and in its very strain after reconciliation reveals each opposing factor in its most unmitigated hostility[43].

These earliest and still most uncontrolled attempts of imagination and art we meet most signally among the ancient races of India, the main defect of whose productions, when viewed relatively to their particular position at this stage of our classification, consists in this, that they are neither able to seize the profounder aspects of significance in independent clarity, nor grasp the reality of sense-perception in its characteristic form and meaning. The Hindoo race has consequently proved itself unable to comprehend either persons or events as parts of continuous history, because to any historical treatment a certain soberness is essential of accepting and understanding facts in their true and independent form, and subject to their mediating links, grounds, causes, and objects, being empirically ascertained. The natural impulse to refer all and everything back to the Divine is hostile to this prosaic reasonableness, no less than its tendency to prefigure for itself in the most ordinary or most sensuous of objects a presence and reality of godhead created by its own imagination. These peoples consequently, through their confused intermingling of the Finite

and the Absolute, in which the logical order and permanence of the prosaic facts of ordinary consciousness are disregarded altogether, despite all the profusion and extraordinary boldness of their conceptions, fall into a levity of fantastic mirage which is quite as remarkable, a flightiness which dances from the most spiritual and profoundest matters to the meanest trifle of present experience, in order that it may interchange and confuse immediately the one extreme with the other.

If we concentrate our attention more closely upon the more conspicuous features of this continuous bout of intoxication, this craze and condition of craze, what we are concerned with is not to trace religious conceptions as such, but merely to emphasize the points of prominence which relate such modes of conception with art. These may be indicated as follows:

1. One extreme of the consciousness of the Hindoo is the consciousness of the Absolute, here regarded as the essentially and absolutely Universal, undifferentiated and consequently wholly indefinite. This supreme of abstractions, inasmuch as it is neither in possession of a particular content, nor is conceived under the mode of concrete personality, is, from whatever side you may look at it, no object at all that the imagination acting through the senses can reclothe for art. Brahman[44], taken in a general sense as this supreme Godhead, is absolutely removed from the sensuous and sense-perception, or rather is not even an object for Thought. For self-consciousness is inseparable from thought, which posits itself as an object of Thought, in order that it may thus come to self-knowledge. Every act of intelligence is an identification of the ego and object, a reconciliation of that which is severed outside from this relation of recognition; what I do not understand remains as something strange and foreign to myself. The mode of union, under the Hindoo conception, of human personality with Brahman is nothing more nor less than a continually ascending process of exhaustion[45] in the direction of this supreme of abstractions, in which not

merely the entire concrete content, but also self-consciousness itself, must be eliminated before the final consummation is realized. Or, to put the same thing another way, the Hindoo recognizes no reconciliation and identity with Brahman in the sense that the spirit of humanity becomes *conscious* of this union. The unity rather consists in this, that both consciousness and self-consciousness, and with them the entire content of the objective world and personality totally disappears. This emptying and annihilation to the point of absolute vacuity is treated as the supreme condition under which man is capable of identity with highest Divinity, that is Brahman. An abstraction of this sort, one of the barest it is possible to imagine, whether we consider it from the point of view of the Absolute, as Brahman, or from the human aspect of a purely theoretically conceived cultus that consists in man's self-evaporation[46] and self-annihilation, is in itself no object either for the imagination or art; all the latter can do is to profit by such opportunity as various imaginary representations of what happens by the way to this goal may offer for their exercise.

2. Conversely the Hindoo view of existence launches itself with just the same immediacy over this very abstraction from all sense into the wildest flood of it. Inasmuch, however, as the immediate and consequently unbroken identity of both sides is in this view cancelled, and instead of this the element of *difference* within this identity has become the basic principle of the type itself, this very contradiction plunges us with no mediating connections from the Finite into the Divine, and again from this latter into what is most transitory of all; and we live and move among *simulacra*, which rise up entirely as the growth of this alternating process, a kind of witches' world, where the definition of every shape eludes our grasp as we endeavour to seize it, is converted all at once into its opposite, or straddles away into mere inflated enormities.

The general modes under which Hindoo art manifests itself may be summarized under the three following points of view:

(*a*) In the first place we find the full hugeness of the content of the Absolute is imposed by the imagination upon the *sensuous* in its aspect of singularity in such a way that this particular thing is itself, in its own form and station, taken completely to represent such a content and to exist as such for the imaginative sense. In the Râmâyana, for example, the friend of Râma, namely, the prince of apes Hanuman, is a principal personage, and he accomplishes the bravest of exploits. And generally we may observe that among the Hindoos the ape is revered as Divine, and we find, in fact, an entire city of apes. In the ape, as this point of singularity, the infinite content of the Absolute is envisaged and adored. It is just the same with the cow, Sabalâ, which in the Râmâyana during the episodic treatment of the expiations of Visvamitra, appears clothed with immeasurable power. If we take a glance on higher planes we find entire families in India — even though the individual here be merely a vacant and monotonously vegetating life-unit — in whom the Absolute itself, as this concrete reality, is adored in its immediate life and presence as God. This same coincidence is found in Lamaism. Here, too, a single individual receives the highest worship due to the present God. In India, however, this honour is not exclusively paid to one man. Every Brahmin proves at once his claim from the day of his birth in his own caste to be ranked as Brahman, and possesses that second birth of the Spirit which identifies his humanity with God, in the way of Nature through his actual bodily birth, so that the crown of the most Divine itself is immediately referred back upon the entirely commonplace fact of physical existence. For although the Brahmin is under the most sacred obligation to read the Vedâs, and attain by this means an insight into the secrets of Deity, this duty can be actually carried out in the most perfunctory way without detracting in the least from the Brahmin's own divinity. In a similar manner

it is one of the modes most common to the representations of Hindooism to have the primordial God set forth as the procreator or begetter, as we find Eros is in the case of Greek mythology. This procreation as Divine activity is further worked into all kinds of representations in a wholly material way, and the private parts, both male and female, are treated as sacred in the highest sense. And in a reverse way, and to no less extent, the Divine, when it passes over in its independent Divinity to the plane of existing reality, is suffered in a wholly trivial manner to get mixed up with everyday details. We may take an example of this from the commencement of the Râmâyana, where Brahmâ has come on a visit to Vâlmîkis, the mythical bard of the Râmâyana. Vâlmîkis receives him entirely in the common Hindoo fashion, pays him a compliment or two, places a stool before him, and supplies him with water and fruits. Brahmâ sits down just like anybody else and constrains his host to do likewise: and there they sit on and sit on until at last Brahmâ orders Vâlmîkis to compose the poem of the Râmâyana.

Modes of conception such as these are still not symbolic in the strict sense; for although we find that here, as the symbol requires, forms are taken from the material of sense and diverted to the use of conceptions of more universal import, we still find the further condition of this requirement wanting, namely, that the particular existences must not actually exist for sense-perception as this absolute significance, but merely *suggest* the same. For the Hindoo imagination the ape, the cow, and the particular Brahmin are not merely a cognate symbol of the Divine, but are contemplated and represented as the Godhead itself, as existences adequate to that Godhead.

It is the contradiction inherent in this immediacy which is the motive force of another feature in the conceptions of Hindoo art. For while, on the one hand, that which is absolutely severed from sense, the spiritual significance out and out, is conceived as the actually Divine, yet, on the other, the particular facts of concrete reality are immediately envisaged by

the imagination, even in their sensuous existence, as Divine manifestations. They are no doubt partly only taken to represent particular aspects of the Absolute; but even so the particular thing in its immediacy is still incompatible with the universality, which it is, as adequate to the same, introduced to express; and it appears in all the more glaring contradiction to it for the reason that the significance is here already conceived in its universality, yet, despite of this, an express relation of identity is immediately set up by the imagination between it and the most particular of material facts.

(*b*) The most obvious way in which Hindoo art endeavours to mitigate this disunion is, as we have already suggested, by the *measureless* extension of its images. Particular shapes are drawn out into colossal and grotesque proportions in order that they may, as forms of sense, attain to universality. The particular form of sense, which is taken to express not itself and its own characteristic meaning as a fact of external existence, but a universal significance which lies outside it, fails to satisfy the imagination until it has been torn out itself into vastness which knows neither measure nor limit. This is the cause of all that extravagant exaggeration of size, not merely in the case of spatial dimension, but also of measurelessness of time-durations, or the reduplication of particular determinations, as in figures with many heads, arms, and so on, by means of which this art strains to compass the breadth and universality of the significance it assumes. The egg, for example, contains the bird within it. This particular fact is enlarged to the measureless conception of a world-egg secreting the universal life of all creation, and in which Brahmâ, the procreating God, accomplishes without effort the year of creation, until by virtue of his thought alone the the two halves of the egg fall asunder. And, in addition to natural objects, human individuals and events are exalted that they may express the significance of truly Divine action in such a way that we can neither hold fast the Divine or

the human in their independence, but both seem to run in a continual confusion backwards and forwards into one another. As a striking illustration of such a mode of conception, we have the incarnations of certain Hindoo gods, principally Vishnu, the conserver of life, whose exploits figure largely in the great epic poems. Râmas is, for instance, himself the seventh incarnation of Vishnu (Râmatshandra). From a review of particular demands, actions, circumstances, modes of appearance, and traits of demeanour, we are led to infer from these poems that this content is in great measure borrowed from actual events, that is from the exploits of ancient kings who exercised a powerful influence in creating new conditions of law and order; we find ourselves surrounded by a thoroughly human atmosphere and on the firm ground of reality. But then again, in a converse direction, the entire scene expands, reaches out into the nebulous, playing over and beyond it with universal conceptions, so that we lose the vantage ground we had gained and are robbed of all our bearings. We are treated in just the same way in the Sakuntala. At first we have set before us the most gentle and odorous realm of Love, in which everything goes on its way in an entirely human fashion; and then we are all at once snatched from the wealth of this genuine world, and transported into the clouds of the heaven of Indra, where everything suffers change, and our formerly circumscribed sphere is inflated to the measure of the universal import of Nature's life in its relation to the Brahmin and the power of Nature's gods, which is vouchsafed to man in return for his severe self-mortifications.

Such modes of representation are also not to be termed in a strict sense symbolical. That is to say the true symbol suffers the determinate shape, which it applies, to remain under that original definition, because its purpose is not to envisage therein the immediate existent of the significance in its universality, but to point to that import merely *through* the qualities of the object which are cognate to it. Hindoo art, however, although it severs

universality from the singular existing fact, still adds the further requirement that both sides shall be immediately united through the imagination, and is consequently forced to divest determinate existence of its specific limitations, and, albeit in a material fashion, to enlarge in the direction of indefiniteness and generally to change and reconstitute. In this melting down of all clear definition, and in the confusion which results from it, so that that form is always set down as highest for everything, whether phenomena, events, or actions, which in the mode of their figuration can neither for themselves assert nor intrinsically possess and express any control over such content, we may rather seek for features analogous to the type of the *sublime* than see any illustration of real symbolism. For in the Sublime, as we shall see for ourselves further on, the finite phenomenon only expresses the Absolute, which it would previsage for conscious sense to the extent that in so doing it escapes from the world of appearance, which fails to comprehend its content. This is just its treatment of eternity. Its idea of it is sublime when it has to be expressed in terms of time-duration, precisely through the emphasis it lays on the fact that no number, however great, is sufficient. In this strain runs the text: "A thousand years in Thy sight are even as a day." Hindoo art contains much of the same or similar nature. It strikes the opening notes of "the Sublime" symphony. The main difference, however, between it and the true Sublimity consists in this, that the Hindoo imagination does not in the wild exuberance of its images bring about the essential nothingness of the phenomena which it makes use of, but rather through just this very measurelessness and unlimited range of its visions believes that it has annihilated and made to vanish all difference and opposition between the Absolute and its mode of configuration. In this extreme type of exaggeration, then, there is ultimately little of real kinship with either true symbolism or Sublimity: it is equally remote from the true sphere of beauty.

It offers us no doubt, more particularly in its more sober delineation of that which is exclusively human, much that is endearing and benign, many gracious pictures and tender emotions, the most splendid and seductive descriptions of Nature, the most childlike traits of Love and naïve innocence, and withal much too that is magnanimous and noble; but, none the less, if we review it generally according to the fundamental import of all it expresses, we shall find that the spiritual is throughout rooted in sense, the meanest objects are placed on the same plane as the highest, true definition is wrecked, the Sublime is lowered to the conception of mere immeasurability, and that which is the original material of mythos for the most part vanishes before our eyes in the fantastic dreams of a restless and inquisitive imaginative power, and modes of shaping the same devoid of all intelligent purpose.

(*c*) In conclusion, the purest form of representation which we meet with at this stage of imaginative conception is that of *personification*, as it generally applies to the *human figure.* For the reason, however, that the significance on this plane is not as yet grasped as the free subjectivity of Spirit, but rather either under a determination of abstract universality or as a mode of natural existence, one that contains, for example, the life of rivers, mountains, stars, or sun, for this reason it is only employed as means of expression for this kind of content under a mode which really detracts from the full worth of the human form. For the human body, if we view it in its true definition, no less than the form of human activities and events, expresses simply concrete Spirit and a spiritual content, which is self-contained and subsistent in this its reality, and possesses therewith no mere symbol or external sign.

From one point of view consequently this personification, albeit the significance, which it is invoked to represent, is taken to belong to the spiritual no less than the natural, yet, on account of the abstractness which

clings to this form of significance, is on this stage of thought still of a superficial nature, and needs yet many other modes of representation to be rendered clear to the closer inspection, forms with which it is here confusedly mingled and thereby itself made obscure. And, moreover, taking it under another aspect, it is not the subjectivity here and its form which supplies the characterization, but rather its *expressions*, actions, and so forth; for it is in deed and action that the more defined line of severation first asserts itself, which can be brought into relation with the specific content of the universal significances. In that case, however, we are again face to face with the defect that it is not the conscious subject, but merely its *means of expression*, which supply the signification, no less than the confusion of thought, that events and deeds, instead of constituting the reality and the existence of the subject as determinately self-realized, preserve its content and significance elsewhere. A series of such actions is able therefore very possibly to carry with it a certain result and consequence, which is derived from the content which such a series subserves as its expression. This consequent result is, however, to an extent equally great, liable again to be interrupted and in part suspended by that which is central in the personification and the man[47], because subjective activity is also a stimulus to capricious action and its manifestation, so that both that which is significant and that which is destitute of this quality keep up their varied and irregular interplay just in so far as the imagination is unable to unite their significant characteristics and the forms which are appropriate to them in one substantial and secure mode of association. And, moreover, if it is the purely natural aspect of such facts which is exclusively accepted as the unified content, in that case the material must inevitably prove itself inadequate to support the human form, just as this, being only fully adapted as a means of expressing Spirit, is on its side incapable of representing what is wholly natural. In all these respects such a mode of

personification as the one we are examining fails to express a true mode; for the truth of art requires, as the truth universally requires, that there should be a complete concordance between the inward and the outward, that is, the notion and its reality. Greek mythology, for example, personified the Pontine sea; Scamander possesses its river gods, nymphs, dryads, and so forth. In other words it builds up Nature in the most various forms as the content of its human divinities. It does not, however, suffer its personification to remain purely formal and superficial, but creates thereby real individuals, in whom the purely natural significance fades into the background, and the human element, on the contrary, which has taken up and absorbed such material out of Nature, becomes the prominent factor. Hindoo art, on the other hand, is unable to advance beyond a grotesque intermingling of these two sides of Nature and humanity, so that neither is treated according to its rightful claim, and both are merely given the forms which are appropriate to the other.

Speaking in a general way we cannot consider even these personifications to be as yet strictly symbolical, for the reason that owing to their formal superficiality they do not stand in any essential relation to or mode of association more truly intimate with the more determinate form which they are presumed to express. At the same time we may note here, with respect to other particular modifications and attributes, with which such personifications appear to be intermingled, and which are taken to express the more defined qualities generally attached to Divinities, an impulse in the direction of symbolic representation, for which the personification then stands merely as the universal type of widest connotation.

If we turn now to the more important examples of the imaginative sense on the plane we are now considering, we have first to draw attention to

Trimûrtis, the triformed Godhead. This Deity includes in the first place *Brahmâ*, the activity which brings forth and procreates, the creator of the world, Lord of all the gods and much more beside. On the one hand he is to be kept distinct from Brahman (as Neuter), that is from the ultimate Being, and is the first-born of such. In another aspect, however, he again seems to fall into union with this abstract Godhead, as generally happens with Hindoo thought where the lines of difference are rarely held secure, and part are allowed to vanish and the rest simply to get confused with each other. The form with which he is most closely identified has much that is symbolical about it; he is formed with four heads and four hands, and with the latter are his sceptre and ring[48]. He is of a red colour, an obvious suggestion of sunlight, since these Divinities invariably carry qualities which are of universal significance in Nature and which are thus personified in them. The *second* Deity of this triune Trimûrtis, is Vishnu, the preserving Godhead, the *third* Sivas, the destructive Power. The symbols employed to represent these gods are countless. For by reason of the universality of the significances they express they comprehend an infinite number of varied activities. In part these are related to particular phenomena of Nature, mainly the elementary, such as, for example, the quality of "fiery,"[49] which is an attribute of Vishnu, and frequently we have set before us shapes of the most antagonistic description.

In the conception of this triform god we have the fact at once brought home to us in the clearest way that the form of Spirit is not yet able to assert itself in its Truth if for no other reason than this, that here it is not the spiritual which constitutes the truly permeating significance. That is to say, this trinity of gods would only be Spirit if the third god were an essentially concrete unity, a unity which returned upon itself from the differentiation and reduplication of its substance. For God, according to the true conception of Godhead, is Spirit as this active and absolute self-

differentiation and Unity, a conception which is generally what constitutes the notion of Spirit. In this Trimûrtis, however, the triune God is not by any means such a concrete totality, but merely a passage from this to that, a metamorphosis, a procreator, a destroyer, and so forth. We must be accordingly very careful not to imagine that we have discovered the highest Truth in these most primordial gropings of man's reason, and in this one note of concord which, no doubt, as mere rhythmic expression[50], contains the triune form of Deity, that is, the fundamental conception of Christian theology, believe that we already have before us a recognition of the Christian doctrine of the Trinity.

Starting from such fundamental conceptions as those of Brahman and Trimûrtis, Hindoo imagination expatiates still further without let in a countless number of the most varied formed Divinities. For those primary significances of universal application which are apprehended as essential Deity are of such a kind that they may be rediscovered in an infinite number of phenomena, which are again personified and symbolized as gods, and each and all combine in throwing the greatest obstacles in the way of any intelligible system by reason of the indefinite character and confusing volubility[51] of this type of imagination, which fails utterly to grasp the real nature of anything that it discovers, and merely wrests everything that it touches from its own appropriate sphere. For these gods of subordinate rank, at the head of which we may place such a Divinity as Indrus, who represents the Air and the Heavens, the chief material is furnished by the general forces of Nature, such as stars, rivers, and mountains conceived in the various phases of their activity, their change, their influence on mankind, whether beneficent or hurtful, preservative or destructive. One of the most important subjects, however, of Hindoo imagination and art is the origin of gods and the rest of creation, in other words its Theogony and Cosmogony. For this type of imagination is generally rooted in the

continual effort to carry over that which is most removed from sense into the very heart of the external world, or in the reverse process once more to expunge that which stands nearest to sense and Nature by means of the barest abstraction. Consequently the origin of the gods is referred back to the primordial Godhead[52], and at the same time the workings and existence of Brahmâ, Vishnu, and Sivas are represented as actual in mountains, streams, and human events. A cosmological content of this kind can, on the one hand, contain an independent and specific order of Deities, while on the other these gods are made to merge in those universal significances of the supremest type of Godhead. Such theogonies and cosmogonies are numerous and of every conceivable variety. When anyone ventures, therefore, to say that the Hindoos have thus or thus portrayed the creation of the world or the origin of Nature, such a statement can only be taken to apply to a particular sect or book; you can very easily find a perfectly different account of these events elsewhere. The imagination of this people in the pictures and images they have created is exhaustless.

A mode of conception which is conspicuous throughout the entire series of these creation stories is the constantly repeated presentation of the creative act not in the form of *spiritual fiat*, but of a purely *natural* process of *generation.* Only after having made ourselves thoroughly conversant with this mode of imaginative vision shall we discover the key to unlock the meaning of many representations which at first totally confound all our feelings of shame, shamelessness being here apparently driven to its furthest limits, and in its utter sensuousness carried beyond all belief. A striking example of this mode of imaginative treatment is offered us by the notoriously popular episode from the Râmâyana, known as the descent of Gangâ. This tale is narrated on the occasion when Râmas happens by chance to come to the Ganges. The wintry and ice-covered Himavân, the prince of the mountains, was father by the slender Menâ of two daughters,

Gangâ, the elder, and the beautiful Umâ the younger one. Certain gods, more particularly Indras, beseech the father to send them Gangâ, in order that they may institute the sacred rites, and as Himavat proves himself quite ready to accede to their request Gangâ mounts on high to the blessed gods. After this follows the further story of Umâ, who after accomplishing wonderful actions of humility and penitence, is espoused to Rudras, that is, Sivas. From this union spring up wild and unfruitful mountains. For a hundred years long Sivas lay with Umâ in the bridal embrace, without intermission, so that the gods aghast at the procreative power of Sivas, and full of anxiety for the productive child, beseech him that he will divert the stream of his strength on the Earth. This passage the English translator has not ventured to translate literally, for the reason that it flings too much for him every shred of shame or modesty to the winds. Sivas hearkens to the beseechings of the gods, and staying his former procreative ardour, that he may not utterly confound the universe, he loosens the seminal flood over the Earth. Out of this, transpierced with fire, rises up the white mountain which separates India from Tartary. Umâ, however, falls into scorn and anger at this complaisance, and thereon curses all wedlock. In this section of the tale we have what are mainly fearful and distorted pictures which run so entirely counter to our ordinary notions of imagination and intelligent senses that the most we can do is to observe what they would appear to offer in default of either. Schlegel has omitted to translate this section of the episode and merely added in his own words how Gangâ descends once more on the Earth. And this took place in the following way. A certain forebear of Râmas, Sagaras, was father of a bad son, and by a second wife he was father of no less than 60,000 sons, who came into the world in a pumpkin, were, however, raised up into stalwart men on clarified butter in pitchers[53]. Now it chanced one day that Sagaras was of a mind to sacrifice a steed, which was, however, seized from him by Vishnu in the form of a

serpent. On this Sagaras sends forth his 60,000 sons. But no sooner had they come to Vishnu after great hardships and a long searching than a breath of hers burns them all to ashes. After a weary waiting a certain grandson of Sagaras, by name Ansumân the Shining, son of Asamaschas, set forth to find his 60,000 uncles and the sacrificial steed. He actually comes upon both the steed Siwas and the heap of ashes. The king of birds, Garudas, however, notifies to him the fact that unless the stream of the holy Gangâ flows down from heaven over the heap of ashes his relations will be unable to return to life. Whereupon the stalwart Ansumân endures for 32,000 years on the mountain-top of Himavân the sternest mortifications. All in vain. Neither his own chastisements nor those of yet another 30,000 years of his son Dwilipas are of the slightest avail. At last the son of Dwilipas, the glorious Bhagîrathas, succeeds in accomplishing the feat, but only after mortifications which last 1,000 years. Then the Gangâ plunges down; but in order that the Earth may not thereby shiver in pieces, Siwas now bows his head so that the water runs into his mane. Thereupon yet further mortifications are enjoined upon Bhagîrathas, in order that Gangâ may be free to stream forth from these locks. Finally she is poured forth in six streams; the seventh Bhagîrathas conducts after mighty privations to the place of the 60,000, who mount up to heaven, and therewith Bhagîrathas rules for yet many a year over his people in peace.

Other theogonies such as the Scandinavian and the Greek are very similar in type to the Hindoo. The principal feature of them all is this of physical generation and production; but not one of them plunges so headlong into the subject or in general displays such caprice and impropriety in the images of its invention as the Hindoo. The theogony of Hesiod is in particular far more intelligible and succinct, so that at least one knows where one is, and is clear as to the general significance; and this is so because the impression is far more pronounced that the form and external

embodiment of the myth is set forth by the narrator as something external. The mythos starts in this case[54] with Chaos, Erebos, Eros, and Gaia. The Earth (Gaia) brings forth Uranos of her own accord, and then is mother by him of the mountains, sea, and so forth, also of Cronos and the Cyclops, Centimani[55], whom Uranos, however, shortly after birth incarcerates in Tartaros. Gaia thereupon induces Cronos to castrate Uranos. The deed is accomplished. And from the blood that falls on the Earth spring to life the Erinnyes and the Giants. The castrated member is caught by the sea, and from the sea's foam arises Cytherea. In all this description the outlines are more clearly and decisively drawn. And we are thereby carried beyond the circle of mere gods of Nature.

3. If we endeavour now to seize some point where the transition is emphasized to the stage of real symbolism, we shall find the same already in the first beginnings of Hindoo imagination. That is to say, however preoccupied the Hindoo imagination may be in its efforts to contort the sensuous phenomenon into a plurality of Divinities, a preoccupation which no other people has displayed with anything like the same exhaustless scope and countless transformations, yet from another point of view in many of its visions and narratives it remains throughout constant to that spiritual abstraction of a God supreme over all, in contrast with whom the particular, sensuous, and phenomenal is undivine, inadequate, and consequently is apprehended as something negative, something which has finally to be cancelled. For, as we have from the first noticed, it is precisely this continual involution of one side on the other which constitutes the fundamental type of the Hindoo imagination, and makes it for ever incapable of finding a true principle of reconciliation. The art is consequently never tired of representing, in every imaginable way, the surrender of the sensuous and the power of spiritual abstraction and self-absorption. Of this kind are the representations of toilsome mortifications

and profound meditations, of which not merely the most ancient epical poems, such as the “Râmâyana” and the “Mahâbhârata,” but also many other works of art furnish most important examples. No doubt many of these self-chastisements are undergone on grounds of ambition, or at least with a view to definite objects, which do conduct the devotee to the highest and most final union with Brahman, and to the mortification of everything carnal and finite. An object of this kind is the endeavour to secure the power of a Brahmin; but even in this there is always the fact present to consciousness that the expiation and the continuance of a meditation that is ever more and more diverted from the objects of sense will raise the devotee over his birth-place in a particular caste, no less than help him resist the power of Nature and the gods of Nature. For this reason, that prince of Divinities of this class, Indras, opposes most signally strenuous aspirants, and strives to entice them away; or, in the case where all his seductions fail, he invokes assistance from the supreme gods lest the entire heaven fall into confusion.

In the representation of mortifications of this kind and the several kinds and grades according to which they are ranked, Hindoo art is almost as fertile in its invention as in its system of Divinities, and it pursues the theme with the most thorough earnestness.

This, then, is the point from which we may now extend our survey in a forward direction.

C. REAL SYMBOLISM

In the case of symbolical, no less than that of Fine Art, it is necessary that the significance which it seeks to embody should not merely be set forth, as is the case in Hindoo art, from the first immediate unity of the same with its objective existence, such as obtains before any severation or distinction has as yet been emphasized, but that this significance should itself be

independent and *free* from the *immediate* sensuous content. This deliverance can only so far assert itself as the sensuous and natural medium is both grasped and envisaged as itself essentially negative, as that which has to be and has been absorbed. It is a further requirement, moreover, that the negativity, which is successful in making its appearance as the passing off and the self-dissolution of the Natural, should be accepted and receive embodiment as the *absolute import* of the object generally, as a phase, that is to say, of the Divine. But with a fulfilment of such claims we are already beyond the limits of Hindoo art. It is true that the consciousness of this negative side is not wholly absent from the Hindoo imagination. Sivas is the destroyer no less than the producer. Indras dies, nay, more, the Destroyer Time, personified as Kâla the terrible giant, confounds the entire universe and all gods, even Trimûrtis, who passes away at the same time in Brahman, just as the individual in his self-identification with the highest form of Divinity suffers his Ego and all his wisdom and will to vanish away. In these conceptions, however, the negative element is in part merely a transformation and change, in part only an abstraction, which allows all definition to drop away, in order that it may thrust its path to an indefinite and consequently vacuous and content-less universality. The substance of the Divine on the other hand persists through change of form, passage over and advance to a system of many Deities, and the abrogation of that system once more in the one highest form of God unalterably one and the same. It is not that conception of the one God, which itself essentially possesses, as this unity, the negative aspect as its own determination, both necessary and appropriate to its own essential notion. In an analogous way the destructive and hurtful element is placed according to the Parsee view of existence *outside* the personality of Ormuzd in Ahriman, and consequently only makes a contradiction and conflict manifest belonging under no form of relation to Ormuzd, as a distinct phase of his own substance.

The actual point in the advance which we have now to make consists, therefore, in this that, on the one hand, the negative aspect, fixed by consciousness in an independent relation as the Absolute, is, however, on the other, merely regarded as a phase of the Divine, as a phase, however, which is not only as outside the true Absolute incidental to another Godhead[56], but is to be so ascribed to the Absolute, that the true God appears as a process in which He negates *Himself*, and thereby contains this negative element as an inherent self-determination of His own substance.

Through this enlarged conception the Absolute is for the first time essentially *concrete*, that is self-determination, and thereby essential unity, whose particular antitheses, as parts of a process, appear to consciousness as the different determinations of one and the same God. For the necessity of giving essential definition to the absolute significance is just that which at this stage it is felt to be of first importance to satisfy. All the significances up to this point persisted by virtue of their abstract character as absolutely undefined and consequently void of content, or were merged, when in a converse direction they tended to clear distinction, immediately in the Being of Nature, or fell into a conflict in respect to their configuration which gave them no repose and reconciliation. This twofold defect we have now to remove, both by showing the advance of Thought regarded as itself an ideal process, and by illustrating that advance by means of particular facts of the mind and institutions of nations on the objective plane of history.

And in the *first* place we may observe a more intimate bond of association is set up between the Inward and Outward aspect of consciousness in the increased recognition that every determination of the Absolute is already essentially an inchoate movement in the direction of expression. For every determination is essentially distinction[57]. The External, however, is as such always defined and distinct, and consequently

there is thus an aspect immediately presented, according to which the External is manifested in a form more adequate to the significance than was possible under the modes of conception as yet examined. The first definition, however, and essential negation of the Absolute inevitably falls short of the free self-determination of Spirit as *Spirit.* It is merely the immediate negation of itself. This immediate and consequently natural negation in its most comprehensive form of statement is *Death.* The Absolute is consequently apprehended now in a way that it is compelled to submit itself to this form of negation as a part of the essential determination of its own notion, in other words it is obliged to enter the path of extinction, and we observe consequently the glorification of Death and grief in the first instance made present to the national consciousness as the death of the dying sensuous material. The death of Nature is cognized as a necessary part[58] of the life of the Absolute. The Absolute, however, on the one hand, in order to be subject to this phase of Death, must be posited already as determinate existence; and, equally from another point of view, must not be suffered to remain in the annihilation of Death, but must be held to *re-establish* itself in an essentially positive unity on a yet higher plane of existence. Death is consequently not accepted here as constituting the entire significance, but merely one aspect of the same. And though no doubt the Absolute is in one sense viewed as a cessation of its immediate existence, a passage over and beyond and a passing away, yet it is quite as much in the reverse sense conceived as a return upon itself, as a resurrection, as an eternal process of Divine realization rendered possible by virtue of this evolutional principle of negation. For Death is capable of a twofold meaning. Under the first it is the immediate passing away of the natural; under the second Death is the extinction of the exclusively natural and thereby the birth of a higher type, that is, spiritual, from which the merely

natural falls away in the sense, that Spirit possesses in itself this phase as an essential phase of its own substance.

For this reason, *secondly*, the form of Nature can no longer be accepted in the immediacy of sensuous existence as adequate to the significance referred to it, because the significance of the External consists just in this, that it must die in the form of its real existence and rise again.

On the same ground, *thirdly*, the mere conflict between significance and form and that ferment of the imagination, which was the fantastic product of Hindoo conceptions, drop away. The significance is, it is true, even now not yet fully and with absolute clarity cognized in its pure unity *free* from all sense-presented reality, so that it could be set forth in real *contrast* with the form of its actual embodiment; conversely, however, the form itself, this particular, object, that is, whether in its glorified shape of grandiosity or in any other more conspicuous form of caricature, as an image of animal life, a human personification, event or action, is not taken to envisage for immediate sense an adequate existence of the Absolute. This corrupt form of identity is already surpassed as fully to the extent that it still falls behind that other complete deliverance. And in the place of both of these extremes we have asserted that kind of representation, which we have above already described as the *real symbolical.* On the one hand it is now *able* to appear for the reason that the Inward, or that which is conceived as significance, is no longer something which merely, as in Hindoo conceptions, comes and passes away, at one moment is absorbed immediately in externality, at another is withdrawn from the same into the solitude of abstraction, but it begins to make itself independently secure against the mere reality of Nature. And on the other hand the symbol is now forced to seek some form of plastic shape. That is to say, although the significance, identical in every way with that which has hitherto obtained, possesses as a phasal condition of its content the negation of the Natural, yet the true Inward now for the

first time shows a definite tendency to wrest its way from that Natural, and is consequently itself still swallowed up within the external mode of appearance, so that it is unable independently to be brought home to consciousness in its clear universality without having previously had to comply with the form of external reality.

Now the kind of *configuration* which is implied by the notion of that which generally constitutes the *fundamental significance* in symbolism, may be described in the following terms, namely, we find in it that the definite forms of Nature, human activities and so forth, neither — to express one aspect of it — represent or signify merely themselves severally in their isolated natural characteristics, nor — to emphasize the other aspect — bring their immediate form to consciousness as the Divine actually visible to sense. They are rather employed to *suggest* that same Divine through qualities which they possess cognate with a significance of more comprehensive range. For this reason it is just that universal dialectic of Life, its origin, growth, collapse in and awakening from Death, which also in this connection supplies the appropriate content for the true symbolic type; and this is so because we find in almost every province of natural and spiritual life certain phenomena, which presuppose this process as the basis of their existence, and consequently can be utilized as means of giving a visible body to such significant aspects and of pointing by suggestion to the same, a real affinity being actually inherent between the two sides. Thus plants spring from their seed, sprout, grow, bring forth fruit; the fruit corrupts and produces fresh seed. In the same way the sun rises to a low elevation in winter; in Spring he mounts on high, until we have his meridian reached in summer; it is then that he pours forth his richest blessing or exerts the greatest destructive force; after that he inclines once more towards the horizon. The various stages of human life, too, childhood, youth, maturity, and old age, illustrate precisely the same universal process.

But in a special sense specific localities such as the Nile-valley are adapted to the closer particularization in the direction indicated.

In so far, then, as that which is purely fantastic is displaced by these more fundamental traits of affinity and the more intimate applicability of the expression to the import it expresses there arises a thoughtful process of selection with reference to the comparative congruity or incongruity of the symbolizing forms, and the intoxicated eddy to and fro which prevailed is laid to rest in a more intelligent circumspection.

We consequently observe that a union more at one with itself reappears in the place of that which we found in the first stage of our process, subject, however, to this characteristic difference, that the identity of the significance with its objectively real existence is no longer one immediately envisaged, but one that is *set up* out of the difference and consequently not one previously discovered, rather we should say a mode of union that is the *product of mind* (Spirit). That which, in its most general terms, we call the *Inward* begins at this point to assume the solidity of self-subsistence, to be conscious of itself; it seeks for its counterfeit in the objects of Nature, which on their part possess a similar reflection in the life and destinies of Spirit. Out of this eager movement to recognize the one side in the other, and by means of the external to bring for itself visibly to sense and the imaginative faculty the significance, as also to envisage by virtue of that Inward the significance of the external shapes through a union in which both sides are associated, we get that vast impulse of art which finds its satisfaction through means which are purely symbolical. Only when the Inward is free and is driven forward to make clear to the imaginative vision in real form what it essentially is, and to have before itself this very vision, moreover, in the form of an external work, do we find that the genuine impulse of art, and the particularly plastic arts, begins to be a living fact. Then it is that the necessity is felt to clothe the Inward with a form not merely previously

discovered from the resources of spiritual activity, but rather one that is minted out of spirit (mind) for the first time. In the symbol, then, there is a second form *created*, which, however, is not independently valid for itself as its main purpose, but is rather employed to envisage the significance, and stands consequently in a dependent relation to the same.

It were possible to apprehend the above relation in such a way as though the significance were that point from which the artistic consciousness starts on its journey, and that only after having found this it begins to look round for means to express its universal conceptions through external phenomena cognate in their affinity to such conceptions. This, however, is not the way that real symbolic art proceeds. For its characteristic distinction consists in this, that its penetration fails as yet to grasp the significances in their independent consistency, independent, that is, from every mode of externality. For this reason its point of departure is rather from that which is immediately presented and its concrete existence in Nature and Spirit. This it thereupon, in the first instance, expands to the measure of the universality of such significances, whose determination such objective real existence contains only under more restricted conditions, adding this wider range in order that it may create a form from Spirit, which is to make that universality visible to consciousness in this particular reality when once it is set forth clearly before perception. Regarded as symbolical forms, therefore, the images of art have not as yet attained a form truly adequate to Spirit, inasmuch as Spirit itself is not as yet at this stage essentially clear and thereby free Spirit; but we have at least here embodiments, which essentially proclaim the fact to us, that they are not merely selected to represent simply themselves, but are intended to point to significances of profounder intension and more — comprehensive range. That which is purely natural and sensuous asserts itself as fact and nothing beside; the symbolical work of art, however, whether it be the phenomena of Nature or

the human figure that it makes visible to the eye, points at the same time over and outside such facts to something further, which, however, must possess an intimate root of affinity with the images that are thus displayed, and an essential bond of relation with them. This association between the concrete form and its universal significance may conceivably be present in many different ways. At one time the emphasis will be laid on the external aspect, and it will consequently be more obscure; at another, however, the basis of affinity will be more pronounced as in the case when the universality, which is to be symbolized, constitutes, in fact, the essential content of the concrete phenomenon. In this case naturally it is a much simpler matter to grasp the symbolic character of the object.

The most abstract mode of expression in this respect is *number*, which, however, it is only possible to use as an indication of a further meaning beyond that it ordinarily elucidates when this significance is itself, essentially numerical. The numbers seven and twelve are frequently met with in Egyptian architecture, because seven is the number of the planets, and twelve is that of the lunar revolutions or the number of feet that the water of the Nile must necessarily rise in order to fructify the land. Such a number is then regarded as sacred in so far as it is present as a determinant in the great elementary relations, which are revered as forces in the whole life of Nature. Twelve steps or seven pillars are to this extent symbolical. The same kind of numerical symbolism has an extensive influence upon the form of widely famous mythologies. The twelve labours of Hercules, for example, appear to contain a reference to the twelve months of the year; for if Hercules under one aspect of the myth is no doubt presented to us as the thoroughly human impersonation of a hero, in another he unquestionably indicates a significance of Nature under a symbolized form, and, in fact, is a personification of the course of the sun.

In a further and more complete sense symbolical configurations of space, labyrinthine passages, and such like carry a symbolical image of the course of the planets, just as dances, too, in virtue of their complex evolutions symbolically express the motion of the great elementary bodies.

And further, on a higher plane, the bodies of animals are utilized as symbols, but most succinctly of all the human figure, which, even at this stage, as we shall see later on, appears to be elaborated in modes more compatible with its intrinsic worth for the reason that even now Spirit in general makes a real movement to embody itself from out the mere swaddling clothes of Nature in a shape more adequate to its own self-subsistent personality. Such, then, constitutes our general concept of the true form of symbolism and the necessity under which art labours to express the same. And in order that we may discuss the more concrete exemplifications of this type of symbolism, it will be necessary in dealing with this first plunge of Spirit into the wealth of its own resources to leave the East and direct our attention mainly on the West.

As a symbol of universal import to indicate the point of view where we now stand, we may perhaps first and foremost fix before our eyes the image of the Phoenix, which is its own funeral pile, yet ever is rejuvenated out of the flames of its death and rises from the ashes. Herodotus informs us (II, 73) that at least in representations he saw this bird in Egypt, and, in fact, it is the *Egyptian* people who also supply us with a focus for the type of symbolical art. Before, however, we proceed to the closer consideration of Egyptian art we will mention several other myths, which form, as it were, the passage to that national symbolism which we find most elaborate, no matter from what direction we approach it. Such are the myths of Adonis, that of his death, and the lament of Aphrodite over him, the funeral festivals, etc., conceptions and rites which find their original home on the Syrian coast. The service of Cybele among the Phrygians possesses the

same significance, which also finds its echo in the myths of Castor and Pollux, Ceres and Proserpina.

As the essence of such significance we find in the above quoted examples, before everything else, that phasal condition of negation we have already alluded to, the death, that is, of the natural regarded as a basic and absolute condition of the Divine process, emphasized as such, and made visible in its independence. It is in this sense that we can explain the funeral festivals that celebrate the death of the god, the excessive lamentations over his loss, which is once more made good through his rediscovery, resurrection, and rejuvenescence, making it possible for the festivals of joy to follow. This universal significance contains further its more definite relation to Nature. In winter the sun loses his force, while in spring he returns once more, and with that Nature regains her youth, she dies and is reborn. In examples such as these the Divine, personified as a human event, discovers its significance in the life of Nature, which then from a further point of view becomes a symbol for the essential character of the negative condition generally, in spiritual things no less than natural.

It is in *Egypt*, however, that we have to look for the perfect example of symbolical representation in its systematic elaboration of characteristic content and form. Egypt is the land of symbol, which proposes to itself the spiritual problem of the self-interpretation of Spirit, without being able successfully to solve it. The problems remain without an answer; and such solution as we are able to supply consists therefore merely in this, that we grasp these riddles of Egyptian art and its symbolical productions as this very problem which Egypt propounds for herself but is unable to solve. For the reason that we find that Spirit here still endeavours in the external objects of sense, from which again it strains to free itself, and further labours with unwearied assiduity, to evolve from itself its essential substance by means of natural phenomena no less than to embody the same

in the form of spirit for the *vision of the senses*, rather than as the pure content of mind, this Egyptian people may, in contrast to all the instances previously examined, be described as the nation Art claims for herself[59]. Its works of art, however, remain full of mystery and silence, without music or motion; and this is so because Spirit here has not yet truly found its own life, nor has learned how to utter the clear and luminous speech of mind. In the unsatisfied stress and impulse, to bring before the vision through her art, albeit in so voiceless a way, this wrestle of herself with herself, to give shape to the Inward of her life, but only to become conscious of her own Inward, no less than that which universally prevails[60], through external forms which are cognate with it — we have in a sentence the characterization of Egypt. The people of this wonderful land was not merely agricultural, but also constructive, a folk which tossed up the soil in every direction, delved lakes and canals, and exercised their artistic instincts not merely in giving visible shape to buildings of enormous solidity, but in carrying works themselves of vast dimension to a like extent into the bowels of the earth. To erect buildings of this kind was, as we have long ago learned from Herodotus, a principal occupation of this people, and one of the chief exploits of their kings. The buildings of the Hindoo race are also unquestionably of colossal size; we shall, however, find nowhere else a variety which can compare with that of Egypt.

1. Reviewing now the general conceptions of Egyptian art with a closer attention to particular aspects of it, we may in the first place define the fundamental principle of so much of it as follows, that we find here the Inward is securely held in its independent opposition to the immediacy of external existence. And what is more, this Inward is conceived as the negation of Life, in other words the dead thing, not as the abstract negation of the evil and hurtful thing, such as Ahriman in contrast to Ormuzd, but as form essentially substantive.

(*a*) To illustrate this thought further, the Hindoo merely subtilizes his life to the most empty of abstractions, that is in result one that therewith negates every form of concrete content. Such a Brahm-becoming process is not to be found in Egypt; rather we find here that the invisible possesses a fuller significance; the corpse secures the content of the living body itself, which, however, as torn away from immediate existence, in its retirement from actual life[61], still possesses its relation to that which is alive, and in this concrete form is maintained as self-subsistent. It is a well-known fact that the Egyptians embalmed and revered cats, dogs, hawks, ichneumons, bears, and wolves (Herod., II, 67), but most of all the dead human body (Herod., II, 86-90). By them the honour paid to the dead is not that of burial, but its preservation from age to age as a corpse.

(*b*) And moreover we may observe that the Egyptians do not merely remain constant to this immediate and still wholly natural permanency of the dead. That which is preserved in its physical or natural aspect is also conceived to endure in a form present to the imagination. Herodotus informs us that the Egyptians were the first who held the doctrine that the human soul is immortal. We consequently find that they are the first who present to us a more exalted mode of this resolution of the natural and spiritual, a mode that is to say, under which it is not merely the natural body which secures an independent self-subsistence.

The immortality of the soul is a conception which borders closely upon the freedom of Spirit. The Ego is here apprehended as removed from the purely natural mode of its existence, reposing on its own substance. This knowledge of itself, however, is the principle of freedom. No doubt we are not justified in asserting that the Egyptians grasped the notion of spiritual freedom in its profoundest sense. We must not imagine that their belief in the immortality of the soul is identical with our own form of that belief; but

they already possessed the power to retain securely that which was separated from Life under a form of existence visible only to the imagination, no less than one in which it was identical with the bodily material. They have thereby made possible the passage to the full emancipation of Spirit, albeit it was but the threshold of the temple of freedom that they passed over. This fundamental conception of theirs is further expanded to a unified and substantial Kingdom of the Departed set up in contrast to the immediate presence of the real. A Court of Justice of the Dead is held in this invisible state over which Osiris as Amenthes presides. One of similar character is also instituted in the sphere of immediate reality, justice being executed even among men over the dead, and after the decease of a king every one was entitled to submit his grievances to that court.

(*c*) If we now proceed to inquire what is the *symbolical* form of art, which is given to such conceptions, we must look for this among the characteristic features of Egyptian architecture. The form of this architecture is twofold; there is one type that is superterraneous, while the other is subterraneous.

On the one hand we find underground labyrinths, gorgeous and extensive excavations, passages half a mile in length, dwellings covered with hieroglyphics elaborated with every possible care. On the other we have piled above their level those amazing constructions among which we may first and foremost reckon the *pyramids*. For centuries men have ventilated various notions as to the precise meaning and significance of these pyramids. It is now, however, assured beyond dispute that they are nothing more or less than the enclosures of the graves of kings or sacred animals, such as the Apis, the Cat, or the Ibis. In this way we have before our eyes in the pyramids the simple prototype of symbolical art. They are enormous crystals which secrete an Inward within them; and they so enclose an

external form which is the product of art, that we are at the same time made aware they stand there for this very Inward in its severation from the mere actuality of Nature, and that their entire significance depends on that relation. But this kingdom of Death and the Invisible, which here constitutes the significance, possesses merely the one and, what is more, the formal aspect appropriate to the true type of art, that is its dissociation from immediate existence; it is for this reason primarily but a Hades, not yet a Life, which, although raised above sensuous existence as such, is none the less at the same time essentially a defined existence, and thereby intrinsically free and living Spirit. Consequently the embodiment for such an Inward still remains in relation to the determinacy of the same's content quite as much a wholly external form and envelopment. Such an external environment, in which an Inward reposes under a veil, are the pyramids.

2. In so far, then, as the Inward can be generally envisaged as an external object to immediate perception, the Egyptians in their relation to the aspect opposed to this externality have come to worship a Divine existence in living animals, such as the bull, the cat, and various others. That which is alive is on a higher plane than the purely inorganic object, inasmuch as the living organism possesses an Inward, to which the external shape points, which, however, persists as an Inward and consequently a realm of mystery. This sacred cult of animals must consequently be understood as the vision of a secreted soul[62], which as Life is a power superior to that which is merely external. To us no doubt it can only appear as a repugnant fact that animals, dogs and cats, are held sacred instead of that which is truly spiritual.

This worship, moreover, has nothing symbolical in it viewed simply as such; for it is the actual living animal, Apis or the like, which is here itself revered as the existence of God. The Egyptians, however, have used the shapes of animals in a symbolical way. In that case they are no longer valid,

simply for what they are, but it is further assumed that they express a more universal import. We find the most ingenuous illustration of this in the use of animal masks, which we find more particularly under representations of embalming, at which process certain individuals, who take an active part, either in opening the corpse or removing the intestines, are depicted wearing such masks. It is obvious that the animal's head is not taken to present the animal itself, but a significance at the same time distinct from it and more universal. The forms of animals are also utilized in other ways than this in admixture with the human form. Human figures are to be found with heads of lions, which have been interpreted as images of Minerva; then there are heads of the hawk, and in the heads of Ammon we find the horns still retained. Examples such as the above obviously imply symbolical relations. In a like sense the hieroglyphical writing of the Egyptians is in great measure symbolical, for it either endeavours to make its meaning comprehensible through the images of real objects which do not stand for themselves, but a universality which is cognate with them, or, as is still more frequently the case, in the so-called phonetic aspect of this style of writing, it signifies particular letters by means of the specific mark of some external object, whose initial letter possesses in speech the same tone as that which it is the intention to express.

3. And generally it is the fact that in Egypt pretty nearly every conformation is symbolical and hieroglyphical, expressing not itself but indicative of something more, with which it possesses affinity, or in other words a cognate relation. The truest forms of the symbol, however, are only completely illustrated in such cases where we find that this relation is of a more profound and fundamental character than those we have just adverted to. We will now briefly enumerate a few constantly recurring examples of this more important type of affiliation.

(*a*) Precisely as Egyptian belief[63] surmises a mysterious Inwardness of content in the animal form, we find the human figure represented in such a way that the most characteristic intension[64] of subjectivity is still asserted through an external relation, and consequently is unable to unfold into the freedom of Beauty. Particularly remarkable in this respect are those colossal figures of *Memnon* which, reposing on themselves, motionless, with arms glued to the body, feet close together, inflexible, stiff and lifeless, are set up face to face with the sun, waiting for his ray to strike them, animate them, and make them resonant. Herodotus, at any rate, informs us that these Memnonic figures emitted a musical note on the sun's rising. The higher criticism has no doubt expressed itself as sceptical on the latter point; the fact, however, of a distinct note has recently been once more established both by Frenchmen and Englishmen; and though it appears that this echo is no result of previous mechanical ingenuity, we have an explanation of it in the fact that, as sometimes happens with minerals which make a crackling noise in water, the tone of these images of stone is actually produced by the collective action of the dew, the morning cool, and the subsequent impact of the sun's rays, to the extent, that is, that tiny fractures appear in the stone which then again disappear. In any case we may attribute to these colossal shapes the symbolical import, that they do not possess the spiritual principle of Life free in themselves, and consequently require that their animation should be brought to them externally by Light, which alone is able to unbar the music of their life, instead of having the power to accept the same from that real soul of Inwardness, which essentially carries with it measure and beauty. In contrast to them the human voice is the echo of personal feeling and the soul's self, without any external stimulant, just as the height of human art generally consists in the fact that the Inward of Spirit supplies the form thereof from its own substance. The Inward or soul of the human form

is in Egypt still a mute, and in its animation it is the relation to external nature which alone commands attention.

(*b*) A further type of symbolical conception is to be found in Isis and Osiris. Osiris is an object of procreation and birth, and is done to death by Typhon. Isis seeks for the scattered members, finds, collects, and buries them. This mythos of the god has, then, in the first place as its content purely *natural significance.* From one point of view, that is to say, Osiris is the sun, and his life-history stands as symbolic for his yearly course; from another, however, he signifies the rise and fall of the Nile, which is necessarily the source of all fruitfulness in Egypt. For in Egypt there may not be a drop of rain for years together, and it is the Nile which primarily waters the land by its floods. In winter time it flows but a shallow stream within its bed; then, however, with the summer-solstice ("Herod.," II, 19) it begins for a hundred days to rise, pours over its banks and streams far and wide over the land. Finally the water dries up beneath the sun's heat and the scorching desert winds, and once more retires to its course. Under such conditions the tillage of the soil is carried out with ease; the most luxurious vegetation springs up. Everything buds and ripens. The sun and Nile, and the way both of them become weak or strong, these are the conspicuous forces of Nature in this land, which the Egyptian has symbolically depicted under a human form in the myths of Isis and Osiris. To this type of symbolism, too, belongs the symbolical representation of the zodiac, which is associated with the year's course, just as the number of the twelve gods is bound up with the months. Conversely, however, Osiris typifies under another aspect the entirely *human.* He is held sacred as the founder of agriculture, of the division of the soil, property and laws, and his worship is consequently to an equal extent related to human activities, which are connected in the closest manner with ethical and judicial functions.

In the same way he is judge of the Dead, and secures as such a significance wholly released from the mere life of Nature, an import under which the symbolical tends to pass away for the reason that here the Inward and Spiritual is of itself content of the human form, which, under such a mode of relation, begins to conserve the Inward essentially belonging to it, one, that is, which through its external form signifies merely its own substance. This spiritual process, however, assumes again in equal measure as its content the external life of Nature, and, for example, in temples, number of steps, floors, and pillars, in labyrinths and their passages, windings and chambers, represents the same in an external manner. Osiris is thus quite as much the natural as he is the spiritual life in the different phases of his process[65] and its transformations; and his symbolical embodiments are partly symbolic of the elements of Nature; while again in part these changes of Nature are themselves merely symbols of spiritual activities and their various phases. For this reason, too, the human form persists here as no mere personification, such as we found to be the-case previously, because here the natural aspect, albeit from one point of view it appears as the real significance, yet from another is itself merely asserted as a symbol of the Spirit; and, generally speaking, at this stage of conception, where we find that the Inward struggles to come forth from the sense-vision of Nature, it is in a position of subordinance.

For the same reason we find here that the human figure already receives an entirely different type of elaboration, attesting thereby a real effort to penetrate the arcana of true Inwardness and Spirit, though this endeavour also fails as yet to attain its object, that is, the essential freedom of the Spiritual. And it is by reason of this very defect that the human figure remains before us with neither freedom nor serene clarity, colossal, brooding, petrified, legs, arms, and head glued straitened and tight to the rest of the body, without the grace or motion of Life. Thus it is that art is

first ascribed to Daedalus, in that he loosed arms and feet from their fetters, and endowed the body with movement.

On account of this alternative aspect of symbolism above referred to symbolism in Egypt is, in addition to its other characteristics, a totality of symbols in the sense that what in one respect is asserted as significance is employed as symbol in a sphere cognate with it. This ambiguous association of a symbolism which makes significance and form intertwine, which is further actually typical or suggestive of much, and thereby is already concurrent with that inward subjective sense, which alone is capable of following such indications in a variety of directions[66], is the characteristic distinction of these images, albeit by reason of this ambiguity the difficulty of interpreting them is of course increased.

A significance of this type — attempts at deciphering which are unquestionably nowadays carried too far for the reason that pretty nearly every kind of form is virtually set before us as symbolical in some relation — may very possibly from the point of view of the Egyptians themselves have been clear and intelligible as significance. But, as we insisted at the very entrance of our inquiry, the appropriate motto for the interpretation of Egyptian symbolism is *implicite multum nihil explicite.* There is a type of workmanship undertaken with the express endeavour that it shall carry its own interpretation on the forehead, but we only find there evidence of the effort; it stops short of the essential point of self-illumination. It is in this sense that we must fix our eyes on the works of Egyptian art. They contain riddles, the full solution of which is not merely withheld from ourselves, but was equally beyond the reach of the great majority of the artists who created them.

(*c*) The works of Egyptian art in their excessively mysterious symbolism are therefore riddles, let us rather say the objective riddle's self. And we may summarily define the *Sphinx* as symbol of the real significance of the

genius of Egypt. It stands as a symbol for symbolism itself. In countless numbers, set forth in rows of a hundred at a time, we come across these Sphinx-forms on Egyptian soil; they are hewn from the hardest stone, polished, covered with hieroglyphics, and in the vicinity of Cairo of such colossal dimensions that their lion-claws alone measure a man’s height. Their animal bodies lie in repose, above which as bust a human body rears itself; now and again we find the head of a ram, but in the most common case it is that of a woman. Out of the obtuse strength and robustness of animality the spirit of man is fain to press forward, albeit still unable to attain the perfect representation of his own freedom, or a counterfeit of his body in motion; and this is inevitable, for he is still forced to remain blended in the company of that Other which confronts himself. This straining after self-conscious spirituality, which fails to grasp itself from the truth of its own substance in a form of external reality which is alone adequate to express it, and instead envisages and brings the same home to consciousness in that which is merely cognate with it, but also that which is equally foreign to it, is, in its general terms, the symbolical; and we find it here concentrated to a point as the riddle.

It is in this sense that the Sphinx in the Greek mythos, which itself again is open to symbolic interpretation, appears as the monster which propounds its riddle. The sphinx asked here the famous and problematical question: “Who is it, who walks in the morning on four legs, at noon upon two legs, and in the evening on three?” Oedipus discovered the simple answer that it was man himself, and hurled the sphinx from the rocks. The resolution of the symbol consists in the illumination of all that is implied in the significance of one word, Spirit, just as the famous Greek inscription cries out to mankind: “Know thyself.” The light of consciousness is that clarity, which suffers its concrete content to shine all luminous through the form

which is wholly adapted to unfold it, and in its positive form of existence simply reveals that which it is in truth.

[37] *Bedeutung*.

[38] What Hegel means is that calling an aspect of sense bodily or natural itself implies a distinction from that which is spiritual, or only cognized by mind, and this distinction is not present to the earliest human cognition of Divine reality.

[39] *Das Lichtreine.*

[40] Except in the conceptions of the Hebrew prophets this is only true subject to qualification even of the God of Israel. For he was evidently associated with the thunder, to take but one case — the deliverance of the tables of stone on Sinai.

[41] *Phantasie* may often be translated by the word imagination, but here the element of caprice and dependence on sensuous image rather than creative impulse directed by a principle of selection is to be emphasized.

[42] *Ein Taumel*, *i.e.*, the dance as of intoxication.

[43] This is obviously a difficult passage to follow. The main thing to remember is that Hegel is here describing the movement of a dialectical process, that is the purely objective, rather than the point of view of personal or even national experience. Such vivid expressions as *Taumel* and *schamlos hineinrücken* remind one of the Platonic dialectic.

[44] Hegel's editor has Brahman here, but according to a passage lower down (p. 59) it should rather be Brahmâ.

[45] *Hinaufschrauben*, lit., a screwing up to — a screwing that in fact crews the head off.

[46] *Verdumpfens.* Either Hegel wrote *Verdummens*, or more probably *Verdampfens.* The idea of "becoming mouldy" makes no sense.

[47] This I think is the sense, though Hegel expresses it by using words such as *das Personificieren und Vermenschlichen*, and lower down *das Subjektiviren.* But previously he has rather contrasted that false kind of personification which seeks for the significant in the expression of the subject, his deeds

and acts, rather than in grasping the motive centre of personality, the subjective principle itself, and it appears more intelligible in a passage, which is sufficiently hard to follow in any ease, to preserve that contrast.

[48] There is apparently only one ring and sceptre, but the words used are capable of the interpretation that would attach one for each of the hands.

[49] Hegel cites Wilson's Lexicon, *s.v.* 2.

[50] *Dem Rhythmus nach*, that is, the Hindoo conception is entirely superficial, and expresses rather a rhythmic order than a profound spiritual truth which this number expresses, a truth which as Hegel has previously observed may be expressed under other determinations than the numerical.

[51] *Unstätigkeit*, instability, flightiness, detachment from a fundamental principle.

[52] That is Brahmâ apparently.

[53] The order of the words would strictly mean that the sons were in the pitchers and it is quite possible that this is the meaning.

[54] That is, in Greek cosmogony.

[55] What: *Centimanen* refers to I do not know, possibly a name for Arges, Ceropes, and Brontes.

[56] The sense is "which is not merely (to take the obvious case of opposition which is, however, *not* the one here described) totally outside the Absolute and incidental to," etc. Hegel's words would admit of the interpretation that this was part of the conception he is describing. But this is obviously not so, for, in that case, the negative would be ascribed to both the Absolute and the "other God."

[57] *Ist Unterscheiden*, is that which involves differentiation. To posit a quality is to distinguish from other qualities. A fundamental, aspect of Hegelian logic.

[58] *Glied*, part of one organic totality.

[59] Hegel uses an expression somewhat similar to Milton's "Among the faithless faithful only he." *Den Bisherigen* refers primarily, of course, to the Persian and Hindoo peoples.

[60] *Wie des Innern überhaupt*, *i.e.*, the Inward with its significance as the Absolute.

[61] *In seiner Abgeschiedenheit vom Leben*. In other words the corpse was preserved as still the only appropriate external form of Life. Though Hegel separates the two aspects of Egyptian belief they were necessary concomitants of each other.

[62] I have translated *Innerem* here by "soul," but it expresses of course too much if taken strictly in its most personal sense.

[63] *Aberglaube*, not "superstition" so much as belief that is intuitive, not rationally deduced. The emphasis is on *ahnt.*

[64] Hegel puts it in the rather obscure and contradictory way that the human figure is represented as "still *having* the most unique form of subjective intensity (*Das eigenste Innre der Subjectivität*) outside it."

[65] That is, the mythological history of the God.

[66] Lit., "Which alone is able to apply itself (that is, to the work of interpretation) in a variety of directions."

CHAPTER II

THE SYMBOLISM OF THE SUBLIME

THE PERSPICUITY THAT has no riddles to expound, which is the object of symbolic art and veritably the mark of Spirit self-clothed to the perfect measure of its own substance, can only be attained on condition that first and foremost the significance be presented to consciousness distinct and separate from all the phenomena of external existence. To the union of both immediately envisaged we have traced the absence of art among the ancient Parsees. The contradiction involved in their severation, followed by the association which it then stimulated under the mode of immediacy, was the source of the fantastic type of Hindoo symbolism. Finally, we have seen that in Egypt, too, the free and unfettered recognition of the Inward principle and a significance essentially independent from the phenomenon was lacking; and this resulted in the mystery and obscurity of a symbolism still more complete.

The first decisive act of purification, or, in other words, express separation of the essential substance[67] from the sensuous present, that is from the empirical facts of external appearance, we must accordingly seek for in the Sublime, which exalts the Absolute above every form of immediate existence, and thereby effects that initiatory mode of its abstract liberation which is the basis of the spiritual content. As Spirit in its concreteness the significance is not yet apprehended; but it is, however, conceived as an Inwardness essentially existent, reposing on its own resources, and of such a nature that purely finite phenomena are alone inadequate to express its truth.

Kant has raised a very interesting distinction between the idea of the sublime and the beautiful; and indeed all that he discusses in the first part of his critique of the Judgment from the twentieth section to the end — in spite of its considerable prolixity and its reduction of every form of determination to a fundamentally subjective principle, whether it be the content of feeling, imagination, or reason — still possesses a real interest. We may in fact recognize this very reduction on the ground of its general principle of relation to be just[68]; in other words, to borrow Kant's own expressions, if the matter of our consideration is primarily the Sublime in Nature, it is not in any fact of Nature, but only in the content of our emotional life that such a Sublime is to be discovered, and, further, only in so far as we are conscious of a Nature peculiar to ourselves which involves the added assumption of one that lies outside of us. The statement of Kant is to be taken in this sense where he says: "The true sublime cannot be enclosed in any sensuous form; it is only referable to the ideas of reason, which, albeit no truly adequate representation can be given them, are excited and awakened to life within the human soul by just this very incompatibility of the permissibly sensuous representation with its object[69]." The sublime is, in short, generally the attempt to express the infinite, without being able to find an object in the realm of phenomenal existence such as is clearly fitted for its representation. The infinite, for the very reason that it is posited independently as invisible and formless significance in contrast to the complex manifold of objective fact, and is conceived under the mode of inwardness, so long as it remains infinite remains indefinable in speech and sublimely unaffected by every expression of the finite categories.

The earliest content, then, which the significance secures at this stage consists in this, that in contrast to the totality of the phenomenal it is the essentially substantive *One*, which itself being pure Thought is only present

to thought in its purity. Consequently it is no longer possible to inform this substance under the mode of externality, and to that extent all real symbolical character disappears. If, however, an attempt is made to envisage this essential unity for sense-perception, such is only possible under a mode of relation according to which, while retaining its substantive character, it is further apprehended as the creative force of everything external, in which it therefore discovers a means of revelation and appearance, and with which it is accordingly joined in a positive relation. At the same time it is an essential feature in the expressed content of this relation that this substance is asserted above all particular phenomena as such, no less than above their united manifold; from which it then follows as a still more consequential result that the positive relation is deposed for one that is *negative*; and the negative consists in this that a purification of the substance is thus effected from the phenomenal taken as any particular thing, that is, in other words, that which is also not appropriate to it and which vanishes within it.

This mode of giving form, which is annihilated by the very thing which it would set forth, so that it comes about that the exposition of content affirms itself as that which renders the exposition null and void is in fact the *Sublime.* We have therefore not, as we found to be the view of Kant, to refer the Sublime exclusively to the subjective content of the soul, and the ideas of reason which belong to it, but rather form our conception of it as having its fundamental source in the significance represented, in other words the one absolute substance. We must, then, further deduce our classification of the art-type of the Sublime from this twofold relation of the substantive unity regarded as significance to the phenomenal world.

The characteristic which is held in common by both aspects of this relation, whether we view it positively or negatively, consists in this that the substance is posited above the particular appearance, in which it is assumed

to have found a representation, although it can only be declared thereby under the form of a relation to the phenomenal in its general terms, for the reason that as substance and ultimate essence it is itself essentially without form and out of the reach of concrete external existence. We may describe *pantheistic* art as the first or affirmative mode of conception at this stage, a type of conception which we come across partly in India, and also to some extent in the liberal atmosphere and mysticism of the more modern poets of Persian Mohammedanism, and finally in the still profounder intensity of thought and emotion which characterizes it when it reappears in western Christianity.

Generally, defined substance is cognized at this stage as immanent in all its created accidents, which for this reason are not as yet deposed to a mere relation of service, viewed simply, that is, as an ornament of glory to the Absolute, but are affirmatively conserved by virtue of the indwelling substance; and this is so albeit it is the One and the Divine alone which is set forth and exalted in all particularity. By this means the poet, who contemplates and reveres this unity in all things, and sinks his own individuality, no less than every other object in this contemplation, is able to maintain a positive relation to the substance, with which he associates all other objects.

The *second* or *negative* celebration of the Power and Glory of the one God is that genuine type of Sublimity which we find in Hebrew poetry. In this the positive immanence of the Absolute in the created phenomena is done away with, and in place thereof we have the *one* substance independently affirmed as sovereign Lord of the world, who subsists over against the universe of His creations, which are posited under a relation to this Supreme Being of essential and evanescent powerlessness. If under such a view any representation is attempted of the Power and Wisdom of this Unity under the form of the finite objects of Nature and human

destinies, we find nothing here that resembles the Hindoo's distortion of such objects by the unlimited accretion to their measure. The Sublimity of God is rather brought home to our senses by means of a representation whose entire object is to show us that all that exists in definite guise, with all its splendour, embellishment and glory, is a loyal accident in His service, a show that vanishes before the Divine essence and consistency.

A. THE PANTHEISM OF ART

Anyone who makes use of the word pantheism nowadays exposes himself thereby to the grossest misunderstanding. For, to take but one aspect of the difficulty, this word "all" signifies generally in our modern acceptation of the term "all, and everything in its wholly empirical particularity." We have at once recalled to us, for example, this particular box with all its attributes, its specific colour, size, form and weight, or that particular house, book, animal, table, stool, oven, streak of cloud and so on, to the end of the list. When we consequently find the charge advanced by not a few of our modern theologians against philosophy, that it makes a God of everything in general, it is quite obvious that this "everything" is taken in the sense we have just adverted to, and this it is which is thus bodily thrust upon her shoulders. In one word the complaint which attaches to it is absolutely unwarranted. Such a conception of pantheism only exists in the heads of stupidity, and is not discoverable in any form of religion whatever, not even in those of the Iroquois and Esquimaux, to say nothing of any philosophy. The "Everything" in what has been termed pantheism is therefore neither this nor that particular thing, but rather "Everything" in the sense of the "*All*," that is the One substantive essence, which no doubt is immanent in particular things, but is cognized in abstraction from their singularity and its

empirical reality, so that it is not the particular as such, but the universal animating essence or soul, or to adopt a more popular way of speaking, it is the true and the excellent, both equally a real presence in this particular thing, which are here affirmed and indicated.

This it is which constitutes the real meaning of pantheism, and we shall only have occasion now to employ the expression in this sense. It applies first and foremost to the Orient, whose type of conception is based on the thought of an absolute unity of Godhead and of everything else as subsisting in this Unity. As such Unity and All the Divine can only be presented to consciousness by means of the ever recurrent evanescence of the limited number of particular objects, in which its Presence is expressed. On the one hand we have here the Divine envisaged as immanent in the most diverse objects, whether it be life or death, mountain or sea, and with still closer intimacy no doubt as the most excellent and pre-eminent among and in all determinate existence. On the other hand, inasmuch as the One is this and again that other and that other beyond it, and in short is discharged into everything, all particular existence appears for that reason to be a thing which is cancelled and vanishes, for no particular is alone this One, but this One is this manifold of particulars which pass away before semi-perception, as such particulars into the universe which comprises them. For if the One is Life, it is also at another point Death, and is to that extent not merely life, so that it is neither as life nor the sun nor the sea that these or any other objective realities constitute the Divine and One. At the same time we do not find here, as in the genuine type of the Sublime, that the accidental is expressly posited in the negative relation of mere service. So far from this being so, substance is essentially identified with one particular and accidental existence, inasmuch as it is this One in everything. Conversely, however, this very particular, because it is equally subject to change, and the imagination does not restrict substance to one definite existence, but

moves over every definition, letting it fall that it may advance to another, is thereby relegated in its turn to the accidental, over which the One is superposed in the sublimity thus conjoined with it.

Such a way of viewing existence therefore can only be expressed in art through poetry; the plastic arts are closed to it, inasmuch as they bring before the vision the definite and particular, which in their contrast to the substance present in the objects of Nature has to be given up in a determinate and persistent form. Where we find pantheism in its purity no plastic art is found as a mode of its presentation.

1. Once more we may adduce, as a first example of such pantheistic poetry, the literature of the Hindoos, which along with its fantastic symbolism has also elaborated the type of art under discussion with distinction. In other words the Hindoo race, as we have seen, proceed in their conceptions from the point of most abstract universality and unity, which is then carried forward to the specific shaping of gods such as Trimûrtis, Indras, and the rest. This process of definition, however, is not adhered to with constancy; but to a like extent is suffered once more to break up, so that we find inferior gods are absorbed in superior gods, and the highest of all in Brahman. From this it is sufficiently obvious that this Universal constitutes the one persistent and unalterable basis of all. And if, as we freely admit, the Hindoos evince the twofold impulse in their poetry, namely, either to exaggerate the particular existence, in order that it may appear to the senses compatible with the significance of the Absolute, or, in the converse case, to suffer every form of definition to pass as mere negation when contrasted with the one abstraction of Being, yet at the same time there is another aspect of their literature, in which we also find artistic representation under the purer mode of imaginative pantheism we have just described, a mode in which the immanence of the Divine is exalted above all particular existence in which it is presented to sense and which as such

disappears. We may no doubt be rather inclined to recognize in this later mode of conception a certain similarity with that type of the immediate unity of pure thought which we found to be characteristic of the religious consciousness of the Parsees. Among the Parsees, however, the One and Excellent is conserved in its independence as itself a fact of Nature, that is, Light. With the Hindoos, on the contrary, the One, or Brahman, is merely the formless One; and this it is which in its transformations through the infinite variety of the phenomenal world, first gives rise to the pantheistic mode of representation. So we read of *Krishna* (*Bhagavad-Gita*, Lect. VII, II. 4 *et seq*.): "Earth, water and wind, air and fire, reason and egoity are the eight pieces of my essential force; yet knowest thou somewhat more in me, a more exalted essence, which animates the earthly and supports the world. In it all existences have their origin. Ay, verily, thou knowest I am the origin of the entire universe as also its annihilation. Aught higher than myself is not; in me is this All conjoined together, as a chaplet of pearls on a thread. I am the taste of sweetness in all that flows; I am the splendour in the sun and moon, the mystic Word in the sacred writings, manhood in man, the clean savour in the Earth, brightness in flame, in all Being Life, meditation in all who repent. In that which has Life the Power of Life, in the wise Wisdom, in the glorious Glory. Everything that is true of its kind, and everything that is specious and obscure proceeds out of me. I am not in them, but they are in me. Through the illusion of these three qualities all the world is made foolish, and knows me not who am unalterable. Moreover also the Divine illusion, even Mâya, is my own illusion, which is hard indeed to surpass, albeit all who follow after me step over this illusion." In this passage we have indicated in the most striking terms just such a substantive unity as the one above discussed, not merely from the point of view of its immanence in immediate sense, but also from that of its advance beyond and over all singularity.

In a similar manner *Krishna* affirms of himself that He is the most Excellent among all the different forms of existence (Lect. X, 21): “Among the star’s I am the radiant sun, among the human signs the moon, among the sacred Books the Book of Hymns, among the senses the spiritual, Meru among the tops of the mountains, the lion among animals, the vowel A among all letters, among the seasons of the year the blooming spring-time, etc.”

This enumeration, however, of superlative excellence, and we may add the description of that which is merely a change of forms, among which it is always one and the same thing that is envisaged, despite any superficial appearance such may give us at first of a prodigal imagination, is none the less, by reason of this very equality of content, extremely monotonous and in general empty and tedious.

2. Under a higher mode and in a freer manner from the subjective point of view we find, *secondly*, oriental pantheism is elaborated in Mohammedanism more particularly among the *Persians.*

And here we are confronted with a relation of some singularity when we direct our attention expressly to the point of view of the individual poet.

(*a*) To explain this more fully we would point out that so long as the poet yearns to behold the Divine in everything, and really so beholds it, he also surrenders his own personality; but, while doing so, he realizes quite as vividly the immanence of the Divine in his spiritual world thus expanded and delivered; and consequently there grows up within him that joyful ardour of the soul, that liberal happiness, that revel of bliss, which is so peculiar to the Oriental, who in freeing himself from his own particularity seems wholly to sink himself in the Eternal and Absolute, and henceforth to know and feel the image and presence of the Divine in all things. Such a self-absorption in the Divine, such an intoxicated life of bliss in God borders closely on mysticism. Under this aspect no volume is more famous

than the Oschelaleddin-Rumi, of which Rückert, with the help of his marvellous powers of expression, which enable him to make light of both words and rhymes with all the wealth and freedom of the phantasy that comes so natural to the Persian poet, has supplied us with the fairest examples. Love to God, with whom man identifies himself in most boundless surrender, beholding Him as the One through every part of His Universe, with whom and to whom every and each thing is related and referred — this it is that gives us the focus of this type of thought, a centre which radiates in every direction.

(*b*) And, further, while in the true type of the sublime, as will appear shortly, the most excellent objects and the most glorious shapes are employed merely as the ornament of God, and as servants to celebrate the splendour and majesty of the One, being set before our eyes to do Him honour as Lord of all creation, in pantheism, on the contrary, it is the immanence of the Divine in external fact which exalts the determinate existence itself of the world, Nature, and humanity to its own self-substantial glory. The identical Life of Spirit in the phenomena of Nature and all human relations animates and spiritualizes the same in their own nature, and is further the source of that characteristic attitude of subjective feeling in the soul of the poet toward the objects he celebrates in his song. Suffused with the animating influx of this glory the soul is essentially serene, independent, free, secure in its comprehension and greatness; and in this positive identification of itself with such qualities it penetrates imaginatively with its life into the very heart of objective existence, sharing the restful unity that it finds there, and grows up in most blissful, most blithesome intimacy with the natural world and its munificence, with the drinking-booth no less than the beloved, and, in short, all that is held worthy of praise or affection. We find, no doubt, the same kind of self-absorption in the romantic temperament of the West. Generally speaking, however, and

more particularly in the North, it is not so gladsome, spontaneous, or free from yearning; or, at least, it remains more exclusively shut up in itself, and is consequently selfish and sentimental. A spiritual mood of this type, in its depression and gloom, finds its most forceful outlet in the popular songs of barbarous peoples. The spontaneous and joyful emotional atmosphere is, on the contrary, congenial to the East, and particularly characteristic of the Mohammedan Persians, who openly and gladly surrender themselves with all their soul to the Divine influence, and indeed to everything that appears to merit such devotion, while they do not fail to retain the freedom of independence in such surrender, and consciously to preserve the same in their attitude to the world and all that surrounds them. We may, in fact, observe in the ardour of this passion, the most expansive ecstasy and parrhesia[70] of the emotional life, through which, in its inexhaustible wealth of gorgeous and splendid images, one emphatic note of joy, beauty, and happiness rings again and again. If the Oriental suffers or is unfortunate he takes his reverses as the unalterable fiat of Destiny, and falls back upon the strength of his own resources without any increase of depression, sensitiveness, or vexation of spirit. In the poetry of Hafis we hear often enough of the lover's woes and laments[71], as of many another kind, but our poet persists through grief, no less than in happiness, as free of care as ever. This is the mood of that sometime refrain:

For thanks, in that the present glow
Of friendship circles thee,
Light strong the taper e'en in woe,
And joyful be.

The taper teaches us both to laugh and to weep; it laughs through the flame of shining merriment, albeit it melts at the same time in hot tears; in

the act of consumption it spreads wide the brightness of joviality. This is also the general character throughout of this type of poetry.

Among the objects frequently referred to in Persian poetry we may mention flowers and jewels, and, above all, the rose and the nightingale. It is a matter of frequent occurrence to represent the nightingale as bridegroom of the rose. This gift of personality to the rose and love to the nightingale may be abundantly illustrated from Hafis. “Out of gratefulness, O rose,” he sings, “that thou art the sultana of Beauty, see to it that thou settest not a proud face to the love of the nightingale.” The poet himself speaks of the nightingale of his own soul. When we of the West, on the contrary, refer in our poetry to roses, nightingales, or wine, and such matters, we do so in a wise much nearer to prose. The rose merely serves us for ornament, as in the expression, among others, “garlanded with roses.” If we listen to the nightingale it is but to follow the bird with our own emotions; we think of the grape-juice, and call it “the breaker of our cares.” Among the Persians, however, the rose is no mere image or ornament, no symbol, but itself appears to the poet as possessed with a soul, as loving bride, and he transpierces with his spirit the rose’s very heart. Precisely the same character of a gorgeous Pantheism is still impressed on the most modern Persian poems. Herr von Hammer, for instance, has given us a description of a poem which was forwarded, among other gifts of the Shah, to the Emperor Francis in the year 1819. It contains an account of the exploits of the Shah in 33,000 distiches, who made a present of his own name to the Court poet in question.

(*c*) Goethe, too — here in contrast with the more perturbed atmosphere and the concentrated emotion of the poetry of his youth — was carried away in advanced age by the breadth of this careless and blithesome spirit; and though already a veteran, swept through by the breath of the East, dedicated the evening glow of his poetic passion, in a flood of extraordinary

fervour to this freedom of emotion which, even where controversy is the sub ect-matter, still retains the beauty of its careless temper. The songs of his Westöstlicher Divan, are by no means the mere play of trivial social urbanities, but originate in a precisely similar spirit of free and unrestrained emotion. In a song of his to Suleica they are thus described by himself:

Pearls from the poet,
Thine is the treasure,
Thine was the big swell
Of passion tumultuous,
Which strewed them on desolate
Strand of his life.
Gold-tips I call it,
Pierced with bright jewels,
Tenderly conned o’er
By tapering fingers.

“Take them,” he exclaims to his beloved:

Circle thy neck with them,
Close, close to thy breast!
These raindrops of Allah
The meek shell hath ripened.

Poetry such as this is the product of an experience of the widest range, a sense which has held its own in many storms, a depth and also, too, a youth of the heart — in other words:

World of Life’s own drift of forces,
World, the wealth of whose wave-roll

Caught afar the bulbul’s passion,
Won the song which shook the soul.

3. In this unity of pantheism, moreover, if emphasized in its relation to *personal* life, which feels itself united with God thereby, and the Divine as this presence intuitively cognized, we have, speaking generally, that type of *mysticism* which, under this more intimate mode, has also been elaborated in the pale of Christendom. We will adduce but one example, namely, that of Angelus Silecius, who, with the greatest audacity and depth of conception and emotional fervour, has expressed the essential presence of God in objective Nature, the union of the self with God, and the Divine with human personality, with an extraordinary power of mystical presentment. The more genuine type of Oriental pantheism, on the contrary, is inclined to insist more upon the vision of the One substance in all phenomena and the self-surrender of the individual, who thereby secures the most supreme expansion of conscious life no less than the bliss of absorption into all that is most noble and excellent by virtue of the absolute release from all finitude.

B. THE ART OF SUBLIMITY

The One substance, however, which is here conceived as the real significance of the entire universe, is only truly posited as *substance* where we find it suffered to retire into itself as pure Inwardness and substantive Power out of its presence and realization beneath the shifting forms of the phenomenal, and thereby is *set forth* in self-consistency as against all finitude. It is not till we come to this intuitive vision of the essence of God as absolutely Spiritual and apart from all image, and thus opposed to the things of the World and Nature, that the Spiritual is completely wrested from all that pertains to mere sense-perception and Nature, and delivered

from determinate existence in the finite. While conversely, however, the absolute substance still maintains a relation to the phenomenal world from which it is reflected back upon itself. In this relation is now asserted that *negative* aspect already adverted to, which consists in this, that the entire universe, despite all the fulness, power, and glory of its phenomenal contents, is expressly affirmed in its relation to substance as that which is essentially of a purely negative subsistence, a creation of God, subject to His power and service. The world is therefore envisaged as the revelation of God, and He is the *Goodness* which permits the created thing that has no essential claim to exist, none the less to exist in relation to Himself, nay, further to have independent existence and thereby freely to conserve Him. This conservation on the part of the finitude, however, is without real substance, and in opposition to God the creature is here assumed to be that which passes away and is powerless, so that at the same time its *claim to existence*[72] is exhibited as a part of the goodness of the Creator, which not only veritably affirms the impotence of that which is essentially nothing apart from Himself, but thereby asserts His substance as the source of all Power. It is this relation, so far as it is set forth by art as the fundamental relation, both of content and form, which brings before us the art-type of the real *Sublime.* The Beauty of the Ideal and Sublimity no doubt present features of contrast. In the Ideal the Inward transpierces external reality, whose inward essence it really is under the mode at least, that both aspects are adequate to each other, and consequently appear to be in perfect fusion with one another. In the Sublime, on the contrary, the external existence, in which substance is envisaged for sense, is deposed in its opposition to that substance, such deposition and vassalage constituting the only mode, by means of which the God who is in His own seclusion without form, and in His positive essence incapable of being expressed by aught that is of the world and finite, can be envisualized by artistic means. The Sublime pre-

supposes the significance in the self-subsistence of One, in relation to which externality is defined as in subjection, in so far as that Inward substance fails to appear, but its transcendent character is so asserted, that in the end nothing can be represented save just this essential and active transcendency[73].

In the symbol the mode of the *external form* was the main point emphasized. It must possess a significance, and yet fail completely to express it. In contrast to symbol of this kind and its obscure content we have now a *significance* in the absolute sense of the term conjoined with its full recognition. A work of art is now the actual discharge of pure essence conceived as the intensive purport of everything, of an essence, however, which deliberately affirms that very incompatibility of form to significance, which was only implicitly present in the symbol, to be the actually transcendent significance of God Himself within the sphere of worldly existence, and above all that is contained therein.

It is a significance which is therefore sublime in the work of art, which is exclusively concerned to express the same as thus explicitly declared. We may no doubt with justice accept the description of "*sacred*," as applicable generally to symbolical art, in so far as it accepts the Divine as comprised in the content of its productions; but the art of the Sublime alone can make good its claim to the distinction without any deduction, for it is here alone that God receives all the honour. In this sphere, owing to the fundamental character of the significance implied, the content is generally of a more restricted nature than that we find in genuine symbolism, whose relation to the Spiritual is that of an effort and nothing more, and which in the continuously shifting nature of its relations to to the world offers such a wide field, either for transformations of that which is spiritual into natural images, or of that which is essentially material under accordant fusion with the Spirit.

We find as nowhere else this art of the Sublime, as a mode of its original appearance, in the religious conceptions of the Hebrew race and their sacred poetry. We say poetry advisedly, because plastic art cannot possibly be in question here, where it is assumed that no image whatever is adequate to express the nature of the Divine, and that the part of poetry alone by means of the spoken or written word can be employed for such a purpose. A closer examination of this type of religious conception will secure to us the following points of view most worthy of our general attention.

1. If we look at the content of this poetry under the aspect of its most universal import, one of our first conclusions will be that God, as Lord of a world created to serve Him, is not conceived as incarnated in any form of the external, but rather as personality withdrawn from all determinate and worldly existence into the solitude of His pure Unity. For this reason that[74] which in genuine symbolism was still associated with supreme Unity, falls apart under the view we are considering into its twofold aspect, on one side the abstract subsistency of God, on the other the concrete existence of the world.

(*a*) Now God Himself as this pure self-subsistency of the One substance is essentially without form, and under this abstract conception cannot be brought closer to the envisagement of sense. That which therefore the imagination is able to seize at this stage is not the Divine content viewed under the aspect of its pure essence, inasmuch as this latter precludes the possibility of artistic representation under any form adequate to it whatever. The only content therefore that is left open to it is that of the *relation* of God to His created world.

(*b*) God is the creator of the universe. This is the purest expression of the Sublime itself. In other words we find that here for the first time all those fanciful conceptions of *generation* and purely physical *procreation* of external fact by God disappear. Each and all give place to the thought of

creation by virtue of spiritual power and activity. “God spake: Let there be Light, and there was Light.” A sentence dong ago cited, as a striking illustration of the Sublime by Longinus. And such indeed it is. The Lord of all, the One substance, proceeds, it is true, under the mode of self-expression; but the type of this bringing forth is the purest, nay, a mode of expression, aetherial so to speak, and without material form, the Word that is to say, the medium of thought as the ideal Power, in conjunction with whose mandate that it shall exist, the existing thing is veritably and immediately posited under the relation of tacit obedience.

(*c*) Into this created world, however, God is not conceived to pass over as into His reality; rather He abides withdrawn behind Himself, albeit this opposition supplies no secure ground for a logically developed dualism. For that which has been brought into being is His work, possesses no self-consistency as apart from Him. It is solely a witness to *His* Wisdom, Goodness, and Justice in general, just that and no more. The One is Lord over all; His dwelling is not in the facts of Nature. They are solely the accidents of His Greatness, without potency in themselves, which can indeed suffer the show of His essence to appear, but are unable to make the reality of it visible[75]. And this it is which constitutes the Sublime in its reference to the Divine.

2. Moreover, inasmuch as the one God is thus severed from the concreteness of the phenomenal world and posited in isolated fixity, while the externality of determinate existence is on its side defined and placed in subordination as the finite, both natural and human existence are now viewed under the novel aspect that they cannot be conceived as manifesting the Divine without at the same time making visible their essential finiteness.

(*a*) The most direct way of bringing home to ourselves the significance of the above contrasted relations may be expressed in the statement that here for the first time we have Nature and the human form set before us *cut*

off from the Divine, prosaic fact in short. It is a Greek tale that when the heroes of the Argonautic Expedition passed in their ships through the straits of the Hellespont, the rocks which hitherto had crashed open and shut like shears suddenly came to a standstill rooted firmly for evermore in the ground. In a manner somewhat similar the process of the finite toward stability in intelligible definition, as contrasted with the infinite essence, moves onward in the sacred poetry of the Sublime, while in the conceptions of symbolism, where we have the finite overturned in the Divine and the latter quite as frequently thrust forth from its own substance into temporal existence, nothing is permitted to keep its due position. If we turn, for example, from ancient Hindoo poetry to the Old Testament we find ourselves at once in a totally different atmosphere, one in which we feel ourselves thoroughly at home, however much we may discover in the circumstances, events, actions, and characters an environment either alien or different to that in which we live. From a world of tumble and confusion we are transported to another, and have human figures presented to us, which appear as natural as those we see with our eyes, characters with the stable outlines of patriarchal life, which in the truth of their delineation stand so near that they receive an immediate assent from our intelligence.

(*b*) In a general view of existence such as the above which is able to grasp the natural process of life and to accept as valid the claim of natural laws, *wonder* for the first time is a really active force. In Hindooism everything is a wonder and consequently is no longer wonderful. No wonder can enter a world where the intelligible connection of facts is invariably broken, where everything is wrested from its place and turned topsy-turvy. For the wonderful presupposes the rational sequence of events no less than the clear perceptions of ordinary consciousness which, when it meets with some example of causal effect produced by a higher law breaking the customary chain of events now for the first time notifies the

exception as a wonder. Wonders of this kind, however, are no real or specific expression of the Sublime, for the reason that the ordinary course of natural phenomena is conceived as quite as much the product of the Will of God and evidence of Nature’s submission as such interruption of the same.

(*c*) We must rather look for the real Sublime in the fact that under this view the entire created world is limited in time and space, with no independent stability or consistency, and as such an adventitious product which exists solely to celebrate the praise of Almighty God.

3. This recognition of the nullity of objective fact and the exaltation and extolment of God are at this stage the source of man’s *own* self-respect, and in these he looks for his own consolation and satisfaction.

(*a*) In this connection the Psalms supply us with classical examples of the genuine Sublime, and are set forth as a precedent for all times of what our humanity at the highest point of its spiritual exultation has superbly expressed as the reflection of its religious consciousness. Nothing in the world can here make good its claim to independent subsistence, inasmuch as everything exists and subsists simply through the Power of God, and only exists as in duty bound to extol His mightiness no less than to acknowledge its own essential nothingness. In the imagination of pantheism, which mainly unfolded in the direction of material substance an infinite *extension* of range was most remarkable: what we most are amazed at here is the power of spiritual exaltation which suffers everything else to fall away that it may declare the unique Almightiness of God. An extraordinarily forceful illustration of this temper is the 104th Psalm, “The Light is Thy mantle which Thou wearest; Thou spreadest out the heavens like a carpet, etc.” Light, heavens, clouds, the pinions of the winds, each and all are here nothing by themselves, merely an external vesture, the chariot or messenger in the service of God. A further expansion of the same

idea is the extolment of the Wisdom of God, which has ordained all things. The springs, which leap from their sources, the waters, which flow between the hills, by the banks of which the birds of the air sit and carol among the branches; the grassy vine, which gladdens the heart of men and the cedars of Lebanon which the Lord hath planted; the sea, and its swarms without number; the whales which sport therein, all these hath the Lord made. And all that God has created He also preserves. "Thou hidest Thy Face, and they are affrighted; Thou takest their breath away and they are gone and become again as dust." The 90th Psalm, that prayer of Moses, the man of God, insists expressly on the nothingness of man, where we read: "Thou sufferest them to pass away like a brook; they are like as a sleep, even as the grass, which is soon withered, and in the evening is cut down and dried up. Thy scorn maketh us to pass away; Thou showest Thine anger and we are gone."

(*b*) Two ideas are therefore associated together with the Sublime, if viewed in its relation to the human soul, first, that of man's finiteness, and secondly, that of the insurmountable aloofness of God.

(*α*) For this reason the idea of *immortality* is not to be found where this mode of conception obtains in its original purity; for this idea involves the assumption that the individual self, the soul, the spirit of man is essentially a self-subsistent entity. In the religion of the Sublime it is only the One that is apprehended as imperishable; opposed to that all else merely subsists and passes away, is neither essentially free nor infinite.

(*β*) And, further, on a similar ground man is conceived in his absolute *unworthiness* before God; his exaltation consists in the fear of the Lord, in a trembling before His scorn. Over and over again, with a directness which tears aside every veil and opens the very depths, we have the cry of the soul to God depicted, the sorrow over the sense of its nothingness, increasing lament and groanings unutterable.

(*γ*) On the other hand if the individual persist in his finiteness of opposition to God, this deliberately willed persistence is wickedness, which as *evil* and *sin* belongs only to the natural and human condition, and is conceived as remote from the One undifferentiated substance as pain and everything else that is essentially negative.

(*c*) *Thirdly*, however, within this very condition of spiritual nakedness, and, in despite of it, man secures a freer and more independent position. On the one hand out of the fundamental repose and constancy of God viewed in reference to His Will and the commands which that Will imposes upon humanity, arises the *Law*; while under another point of view the wholly unambiguous distinction between that which is human and that which is Divine, between the finite and the Absolute, is implied in this type of human exaltation. Therewith the judgment upon good and evil, and the onus of decision in respect to either the one or the other is transferred to the individual soul itself. This relation to the Absolute, and the question it involves as to the fittingness or unfittingness of man over against the same presents, therefore, also an aspect, which applies to the individual himself, his own behaviour and action. In other words we may trace in man's rightful acts and his following of the Law a relation to God which is, side by side with the former one, an affirmative relation, a relation which has to bring generally the external condition of his existence, whether it be positive or negative, weal, enjoyment and satisfaction, or pain, unhappiness and oppression into union with the obedience of his heart or his stubbornness of spirit against the Law, and accept the same in the one case as favour and reward, in the other as trial and punishment.

[67] *Des An-und-für-sich-seyenden, i.e.*, the explicit content of all that is implied in actuality cognized as an object in itself.

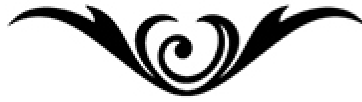
[68] According to Hegel the conception of Kant is right in that (*a*) He makes the Sublime to consist in a relation between the phenomenal fact and something which it is not; and (*b*) that he lays it down that no mere representation by means of phenomenal form can adequately express it. He is wrong, however, in that he refers the Sublime for its source wholly to the subjective content, *i.e.*, that Nature which is peculiar to ourselves (*in uns.*)

[69] "Critique of the Judgment," 3rd ed., p. 77.

[70] Parrhesia, *i.e.*, πἀρρῄσια, — speaking freely or beyond ordinary bound.

[71] *Den Schenken* should be *die Schenken*, and a few lines below *der Kerze* should be *die Kerze.* I omit the *Schenken* altogether. Of course it is possible *der Kerze* is Genitive, "in the woe of the taper," and the verb intransitive; but this is very harsh.

[72] This appears to be the meaning of *Garechtigkeit.*



[73] *Sondern so darüber hinausgeht, dass eben nichts als dieses Hinauseyn und Hinausgehen zur Darstellung kommen kann.* That is, the art of the Sublime is based essentially on a contradiction, for while it assumes the One substance to be the significance of the external world, it is the truth of that significance that it points to that which transcends externality.

[74] The thought here is not strictly logical. What is associated by symbolism with Unity is the external Other, what is divided by Hebraic conception is the entire content of the Real both in its spiritual and external aspect. But the general sense is sufficiently clear.

[75] This I take to be the point of the contrast between the words *scheinen* and *erscheinen*.

CHAPTER III

THE CONSCIOUS SYMBOLISM OF THE COMPARATIVE TYPE OF ART

THE RESULT WE have now arrived at in the above consideration of the Sublime, and in contradistinction to the strictly unpremeditated type of symbolization, consists partly in the *separation* of its own independent Inwardness, consciously apprehended in its quality of significance, from the concrete appearance that is thereby distinguished from it, partly also in the direct or indirect affirmation of the *incompatibility* of the two above mentioned aspects to one another, by which it appears that the significance as the universal passes beyond the particular fact and its singularity. But in the imagination of pantheism, no less than in the type of the Sublime, the real content, that is the One universal substance of all concrete existence, was unable to be presented to imaginative vision or sense-perception without some relation to created existence, albeit created under a mode inadequate to express the essence of that Unity. This relation, however, was attached to the substance itself, which, in the negativity of its accidents, supplied the proof of its Wisdom, Goodness, Power, and Justice[76]. For this reason the relation between significance and content is also in the case of the Sublime, at least in a general way, of a kind that is both *essential* and *necessary*, and the two sides thus linked with each other are not yet, in the strict sense of the term, external to each other. It is, however, inevitable, for the reason that it is implicitly present in symbolism, that this externality should come to be directly posited and appear in the forms we have now to consider in this concluding chapter on the art of symbolism. We may

summarily describe them as *conscious*[77] symbolism, or, in a still more direct way, the *comparative* type of art.

In other words, what we understand by conscious symbolism is this, that the significance is not merely independently cognized, but is *expressly* set forth as distinct from the external mode, in which it is represented. The significance then appears, as in the case of the Sublime, to receive an independent expression which is not essentially in the actual embodiment given to it under the mode employed[78]. The relation, however, of both to one another no longer continues to be, as in the type last examined, a mode of relation which is fundamentally due to the significance itself, but is a more or less haphazard association, which may generally be expressed as the product of the *subjectivity* of the poet, the absorption of his spirit in an external object, the result of his wit or invention; a mode, in short, which enables the poet at one time rather to make a beginning directly from a sensible phenomenon, and to imagine for it from his own mind a spiritual significance cognate with it, and at another to select in preference as his point of departure the real or only relatively personal idea, with a view to embodying the same, or even to do nothing more than relate one image with another, which presents characteristic features of resemblance.

This kind of linking together must consequently be distinguished from that still naïve and *unconscious* symbolism in virtue of the fact that now the individual recognizes the inward essence of the significances he adopts for the content of his creation no less than, the positive nature of the external objects, which he employs as means of comparison for the more direct presentment of the same, placing both in this juxtaposition with clear intention owing to the similarity he has discovered between them. The distinction, on the other hand, between the present type and that of the Sublime is rather to be traced to the fact that though under one aspect it may be true that the separation and juxtaposition of the significances with their

concrete shaping in the work of art is itself set forth in express relief to a less or higher degree, yet, on the other hand, for the reason that it is no longer the Absolute itself that is accepted as content, but any defined and restricted significance whatever, the typical relation of the Sublime falls away, and in its place a relation is set up within the act of severance thus intentionally made between the real significance and its embodiment, a relation which in effect produces the very result in the sphere of premeditated comparison that we found unconscious symbolism in its own way proposed as an object.

In one word, so far as *content* is here concerned, the Absolute itself, *the Lord of creation*, can no longer be conceived as the significance which Art seeks after. That this is so is rendered inevitable by the already obvious fact that on account of the severation of more concrete existence from the notion, and further, if only under the mode of comparison, the juxtaposition of both sides thus separated, the category of *finitude* is there and then accepted by the artistic consciousness, in so far as it conceives this form as the real and ultimate one; and for this reason, moreover, the imagined significances, being selected wholly from the sphere of the finite, have no further association whatever with the Absolute as the fundamental significance of all created things. Sacred poetry stands out in entire contrast to this, for in this God is the exclusive significance of all things; as set over against Him, they have no stability at all, but vanish or are nothing. If, however, the significance is able to discover its image and parallel of resemblance in that which is itself essentially *restricted* and finite, it follows that it must itself to that extent be limited in its range, as, in fact, it is in the type of symbolic conception which now occupies our attention, where that which is found is nothing more than an image, necessarily external to the content, selected purely at random by the poet for the sake of the *similarity* it presents to the content, and as such regarded as relatively adequate

thereto. For this reason there is but one trait left us in the comparative type of art, which is also shared by that of the Sublime, and it is this that every image, instead of embodying the fact and significance directly under a mode adequate to their full reality, is only taken to present an image and similitude of either.

For these reasons this kind of symbolization is, if we conceive it apart as an independent whole, a generic class of subordinate rank. The form which it supplies is merely the descriptive selection of a portion of sensuous existence immediately perceived, or of a prosaic idea of the mind[79], in other words, the significance is expressly to be distinguished from it. And, further, in a measure such an employment of comparison in works of art, which are shaped out of homogeneous material, and in their specific form constitute an indivisible whole, can only assert itself as relatively valid, that is, as mere ornament and accessory, such as we find it, in fact, in the genuine products of classic and romantic art.

It is a further consequence that if we regard the entire sphere of this type as the union of the two stages which preceded it on the ground that it not merely comprehends within itself the *separation* of significance from external reality, which is the fundamental *causa rationis* of the Sublime, but also includes the *reference* of a concrete phenomenon to a universal import cognate with it, as we have seen was asserted in the real type of symbolism, such a union is notwithstanding in no way a higher type of art; it is, in truth, despite its very clearness, a superficial way of apprehending things, limited in its content and formally more or less prosaic, which falls away into the consciousness of commonsense as fully remote from the secretly fermenting depth of genuine symbolism as it is from the height of the Sublime.

So far as the *classification* of our present subject-matter is concerned we may observe, first, that in this act of comparative differentiation, which

presupposes the significance independently, and affirms either a sensuous or imaginary form in a relation of opposition to it, there is the aspect held constantly throughout that the significance is here accepted as of most importance, and the form is solely the embodiment of the same and external to it; but along with this the further difference makes its appearance, namely, that it is sometimes the one aspect of this opposition which is first pre-eminently emphasized, and made the significant point of departure, while at other times it is the other. And owing to this fact we have either the embodiment presented us as an independently external, immediate fact or phenomenon of Nature, which is then related by comparison to a significance of a more general bearing, or the significance is independently come by in another way, and only afterwards a mode of embodying it is selected from some external source, it matters not what.

Relatively to the above distinctions we may classify our material under the two first fundamental and a third and other supplementary divisions as follows:

A. In the *first* it is the *concrete phenomenon*, whether the selection be made from Nature or human events, incidents, and actions, which constitutes both the point of departure in the process of artistic conception, and the substance of essential weight in the reproduction. It is no doubt exhibited solely on account of the more general significance, which it contains and signifies, and is only so far unfolded, that it may contribute to the object of embodying this significance in a specific occurrence or condition cognate with it. The comparison, however, of the general significance and the particular case is not as yet *expressly* set forth as *subjective* activity, and the entire reproduction will not merely be the embellishment of a work which actually possesses a substantive position without it, but is set forth as itself claiming to give the character of an

independent whole. The types of this class are the fable, the parable, the apologue, the proverb, and the metamorphosis.

B. In the *second* phase the *significance* on the contrary is that which is first presented to consciousness, and the concrete embodiment is that which is merely incidental or accessory to it, possessing no independent subsistency of its own, but appearing as wholly subordinate to the significance, so that we are now also made more immediately aware of the element of personal caprice in the selection of this rather than any other image. This mode of production is unable in the great majority of cases to reach the point of a fully perfected work of art, and is consequently forced to leave the forms it supplies as appurtenant to other artistic images. The important types of this class are the riddle, the allegory, the metaphor, the image, and the simile.

C. *Thirdly*, and in conclusion, if rather by way of supplement, we have yet further to include within our list the didactic poem, and purely descriptive poetry, inasmuch as in these types of poetry we find, on the one hand, that the presentment of the general character of the objects in the clearness under which they are made intelligible to commonsense[80], no less than on the other that the exhibition of their concrete appearance receives a substantially independent form, and by doing so effects with elaborate completeness the severation of that which only in its union and really reciprocal fusion is capable of giving us a genuine work of art.

This separation of the two phases essential to the process of art-production carries with it the result that the various forms which find their place in the entire subject-matter under discussion have merely a claim to fall in as part of an inquiry into the modes of art in virtue of the fact that poetry, and only poetry, is in a position to express such a relation of self-contained independence as between significance and form. As opposed to

this it is the very problem of the plastic arts to manifest such significant content in and through their external form and viewed thus externally.

A. MODES OF COMPARISON, WHICH HAVE THEIR ORIGIN UPON THE SIDE OF EXTERNALITY

The attempt to arrange the several kinds of poetic production which are apportioned to this first stage of the comparative type of art carries with it no little difficulty, and is a fruitful source of embarrassment. They are, that is to say, hybrid species of a subordinate rank, which in no way whatever mark out any necessary aspect of art They stand in the domain of Aesthetic presenting features analogous to certain animal types, and other exceptional phenomena in natural science. In both spheres the difficulty consists in this that in either case it is the notion of the science itself, which is the ground of its classification and specific differences. As differentia of the notion these are also at the same time distinctions really adequate to the notional process, and intelligible as such; with these latter such transitional modes are unable fully to conform for the reason that they are merely defective types, which proceed from a previous phase that is fundamental without being able to reach the next one. This is no fault of the notion, nay, supposing that we preferred to make such ancillary types the basis of our classification, instead of pointing out their relation to the specific phases of the *notional* process of our subject-matter, we should have presented us precisely that aspect of them which was inadequate to this process as the irreproachable mode of their development. A true principle of classification, on the contrary, is compelled to proceed from the true notion, and such *hybrid* types as those now discussed can only be suitably placed where the genuine and independently stable ones show a tendency to dissolve and pass over into others.

Apart from such considerations, however, the artistic types referred to belong to the *forecourt* of artistic symbolism, inasmuch as they are generally incomplete, and to that extent *merely* a search after art in its truth. Such a movement no doubt presents the essential ingredients of a genuine mode of configuration, but it lays hold of them in their aspect of finitude, separation, and purely relative propinquity; it fails consequently to rank on the same level. When we discuss, therefore, the fable, apologue, and the rest we must treat these forms not as though they belonged to *poetry* in the specific sense, as it differs among other things from music no less than the plastic arts, but only with the view of pointing out the relation in which they stand to the *generic* types of art. It is only thus their specific character can be elucidated. To such an object the notion of the genuine types of the art of poetry, whether epic, lyric, or dramatic, will not assist us.

We propose now to differentiate these forms in the following order; we shall begin with the *fable*, proceed after that to discuss the *parable*, *apologue*, and *proverb*, and conclude our inquiry with the *metamorphosis.*

1. THE FABLE

Hitherto we have throughout merely dwelt upon the formal aspect of the relation of an expressed significance to its embodiment; we have now furthermore to elucidate the content, which declares its suitability for such a mode.

In our previous consideration of the various aspects of the *Sublime* we saw that at the point where we have now arrived, it is no longer a matter of any importance to envisualize the Absolute and One in its indivisible Power by means of the nothingness and impotency of the created thing to rise up to that infinite transcendency. We are now on the plane of the finite consciousness, and have only to concern ourselves with a finite content. If we direct our attention conversely to the genuine symbolical type, to which

the comparative is under a certain aspect equally related, we find that here that *inward* aspect, which stands in opposition to the form up to this point always immediately presented, the natural shape, that is to say, is the spiritual, a truth that even in Egyptian symbolism received ample illustration. To the extent, however, that everything natural is left standing, and preconceived in its position of isolated *solidarity*, the spiritual is also something both *finite* and *defined*, that is to say man and his finite aims and the natural maintains a certain, albeit theoretical[81], relationship to these objects, a significant suggestion and revelation of the same to the use and weal of mankind. The phenomena of Nature, storms, flight of birds, the constitution of the intestines of animals and so forth, in the significance they possess for human interests, are now accepted in a totally different sense to that they figured in the conceptions of Parsees, Hindoos, or Egyptians, for whom the Divine is still linked to the Natural under the mode that man, as an integral part of Nature, moves to and fro in a world full of gods, and his personal action consists in the display through his activities of this very identity of Life, whereby this doing of his, in so far as it is compatible with the natural existence of the Divine, appears itself as a revelation and bringing forth of the Divine in mankind. When, however, man is withdrawn into himself, and intuitively seeks for his freedom within the closed doors of his own substance[82], he becomes intrinsically the object of his own personality; he acts, transacts his affairs, and works as he himself wills; he possesses a personal life of his own, and feels the essential character of his aims as part of himself, to which the natural is only related as something outside him. Consequently Nature becomes insulated around him, serves him under such an aspect that in his attitude to the Divine he no longer secures an envisagement of the Absolute in her, but simply regards her as a means, through which the gods enable him to discover such a knowledge of themselves as may contribute most to his advantage,

unveiling their will to the human spirit through the medium of Nature and suffering the purpose thereof to declare itself through mankind. An identity of the Absolute and Nature is here presupposed, an identity in which *human aims* are pre-eminently emphasized. A type of symbolism such as this, however, is not within the province of art, but that of religion. That is to say, the *vates* or prophet subordinates every significant relation of natural events, pre-eminently to the service of practical ends, whether it be in the interest of the particular designs of individuals, or in that of the common action of an entire people. Poetry, on the contrary, is bound to recognize and express even the practical situations and relations in a more universal form adapted to contemplation.

What we have, however, to deal with now is a natural phenomenon, an occurrence, which, in its passage, exhibits a particular relation, which maybe accepted as symbol for a general significance in the circle of human deeds and dealings, in other words for an ethical maxim, a saw, for a significance, therefore, whose content unfolds a reflection over the nature of the course which either is taken or ought to be taken in human matters, that is, facts which are related to volition. Here it is no longer the Divine will, which is self-revealed in its essential nature to mankind through natural events, and their religious import. We have nothing more than a quite ordinary course of everyday occurrences, from the isolated reproduction of which we are able to abstract in a way commonly intelligible an ethical *dictum*, a warning, ensample, or rule of prudence, by whatever name we choose to call it, which is set before us in a form that appeals to our imagination for the sake of the reflection it carries with it. And this is just the way in which we ought to regard the fables of Aesop.

(*a*) In other words, the fables of Aesop in their original form are just such a mode of conceiving a natural relation or event between single natural objects generally, mainly between animals, whose intercourse with one

another is based on the same practical necessities of life that are the motive force in that of humanity. This relation or occurrence, as viewed in its more general characters, is consequently of a kind that may happen in the sphere of human life, and as such carries with it a significance for man.

As thus explained the genuine fable of Aesop is therefore the reproduction of a condition of animate or inanimate life, of some occurrence in the animal world for example, which is not by any means composed at haphazard, but is put together in conformity with natural fact and genuine observation, and so reproduced in the form of narrative that, in its relation to human existence, and particularly the practical aspect of the same, a general maxim may be deduced from it. The requirement of *primary* importance that it implies, therefore, is that the particular case in question, which is to supply the so-called moral, must not be purely *imaginary*, that is to say, first and foremost the substance of the composition must not present facts which run *counter* to the mode of their appearance in real life. The narrative may be further and yet more clearly characterized in this that it does not record the particular case itself in its universality, but rather the mode under which this, taken in its concrete singularity and as a real fact, is in such external reality the type for all action based upon analogous circumstances.

This original form of the fable leaves upon it, and this is the *third* point to which we direct attention, the impress of most *naïveté*, because in it the didactic aim and the deduction of general significances of utilitarian colour do not appear to be that which was the original intention of the narrator, but rather something which turned up afterwards. For this reason the most attractive among the so-called fables of Aesop will be those which correspond most emphatically with this naïve tone and narrate actions, if such an expression may here be used, or at least relations and events, which in part are founded upon animal instinct, partly are the expression of some

other natural relation and partly are generally put together for their own sake rather than exclusively composed as the fancy of the moment happened to dictate. For this reason it is further sufficiently obvious that the motto *fabula docet*, which has attached itself to these fables as we now have them presented us, either takes the true spirit out of them, or frequently is something like a fist in our eyes[83], so that quite as often as not we are inclined to deduce the intended maxim's opposite, or one or two as good if not better.

In further elucidation of this conception of these Greek fables we propose now to offer a few illustrations. The oak and the reed stand in the teeth of the storm-wind. The slender reed merely bows before it, the stubborn oak snaps. This is a frequent enough occurrence in a great storm. In its ethical suggestion what we have here is some man of high position and inflexible temper as opposed to one of more modest station who, through his natural pliancy, is able in misfortune to keep himself secure on such ordinary levels, while the great man goes to ground through his pride and obstinacy. An analogous case is the fable of the swallows which we find in the Phaedrus. The swallows and other birds with them see a rustic sowing the flax seed, from the growth of which the bird-snare is to be made. The provident swallows fly away, the other birds think nothing of the morrow; they abide at home and are caught. A real phenomenon of Nature is also at the bottom of this fable. It is a notorious fact that in autumn swallows are off to southerly climes, and consequently are absent when birds are snared. The same thing may be said of the fable about the bat, which is despised by day and night, because it belongs to neither the one nor the other. A more general human significance is attributed to real prosaic incidents of this class, much as pious people are only too ready nowadays to interpret everything that occurs in a sense that is edifying or useful. It is, however, not essential to such a purpose that in every case the

true fact of Nature should appear at once as obvious. In the fable, for instance, of the fox and the raven we are unable at first blush to recognize the natural fact, although it is not wholly absent. It is, in truth, a genuine characteristic both of ravens and crows that they set about cawing when they happen to catch sight of strange objects, whatever they may be, whether man or beast, in sudden motion. Natural relations of a similar kind lie at the root of the fable of the thorn-bush, which plucks the wool off the passer-by, or wounds the fox that seeks refuge there, or that of the countryman who warms a snake in his bosom. Others set forth occurrences which may naturally form part of animal experience; take, for instance, the first example of the fables of Aesop where the eagle devours the cubs of the fox and carries off a hot coal attached to the sacrificial flesh which sets his nest on fire. And, in conclusion, we find that others contain traits of old myths, such as the fable of the dung-beetle, eagle, and Jupiter, where the circumstance borrowed from natural history — we will pass it by for what it is worth — appears to be referable to the different seasons of the year when the eagle and dung-beetle respectively lay their eggs; at the same time we may observe a clear intimation here of the traditional importance of the scarab, which, however, even in our present example, is already treated with an inclination toward comedy, an inclination still more pronounced in Aristophanes. As an excuse for not entering more fully here into the question how many of these fables can actually be traced to Aesop we mention the already well-established fact that only of quite a small minority — the last-cited one of dung-beetle and the eagle is among them — can it be shown that they date from Aesop's time, or that in general terms there is any flavour of antiquity about them to support the view that Aesop is in fact their author.

Of Aesop himself we are informed that he was a deformed and humpbacked slave; and for his place of residence we are transported into

Phrygia, the very land, that is, which marks the passage from the immediately symbolical and the existence still fettered on Nature, to a land in which man begins to take real hold of the spiritual and himself as the source of the same. In our present connection, no doubt, he does not behold the animal and natural world in the way the Hindoos and Egyptians beheld it, that is, as something of itself, superior and Divine. He regards it with prosaic vision as something whose relations are only of service in the presentment of a picture of human act and avoidance. His conceits are further merely the reflections of wit, without real energy of soul or depth of insight and a fundamental grasp of reality, without poetry and philosophy, in fact. His opinions and maxims are, in consequence, fairly rich in sensuous image and traits of cleverness, but we never get beyond the digging away into mere trifles, which, instead of creating free shapes from the unfettered life of spirit, is contented to discover some additional aspect that is new in material already close at hand, such as the specific instincts and habits of animals or other daily occurrences of little moment; and this is so because that which he would teach he is still afraid to express freely, and is only able to make it intelligible in a kind of riddle which is at the same time always being solved. Prose has its origin in the slave, and in the same way prose clings to the entire type of conception with which we are now concerned.

Despite this fact, however, the experience of almost all nations and times has in one form or another run through these old tales; and however much any particular people whose literature is generally well versed in fable may pride itself as possessing more than one fabulist of distinction, we shall find that their poetry is for the most part merely a reflection of these primary sallies of invention, merely translated into the vernacular of the age. All that has since been added to the general heritage of such conceits falls far behind the original legacy in real merit.

(*b*) There are, however, among these fables of Greek descent a number which betray the greatest poverty of invention and execution, being mere pegs on which to hang the instructive moral, so that the contents, whether they refer to gods or animals, have merely a formal significance. Yet even these are far enough removed from the modern tendency of doing violence to the animal world as we find it in Nature. An example of this tendency is that fable of Pfeffel about a marmot which collected provisions in autumn, an act of foresight which another marmot neglected, and so was brought to the condition of beggary and starvation. Or there is that other of the fox, the bloodhound, and the lynx, of whom it is narrated that they presented themselves before Jupiter, together with the talents which exclusively belonged to them of cunning, keen scent, and clear sight, and requested that these gifts should be equally divided between them; the fable goes on that they obtained such consent under these rather surprising terms: "The fox gets a blow on the forehead, the bloodhound is good for no more hunting, the Argus Lynx receives a cataract." That a marmot should cease to make provision for its wants, or that the three animals above mentioned should ever incidentally meet with, or be naturally capable of receiving, a proportionate division of their respective gifts is contrary to all reason and consequently meaningless. A better fable than those above cited is that of the ant and the grasshopper, or that other of the deer with the beautiful horns and the slender legs.

Conformably to the tenor of fables of this kind we have grown, as a rule, accustomed to accept the moral of the fable as that which is of first importance, and to regard the narrative as *merely* an external form, and consequently an event entirely *composed* with a view to expound that moral. Embodiments of this sort, however, more particularly when the occurrence described is wholly at variance with the natural character of specific animals, are in the highest degree insipid, attempts at invention

which mean less than nothing. The real ingenuity of a fable consists exclusively in this that it is able to impart to that which already exists in determinate form a further and more universal significance than that which is immediately presented.

The question has further been raised, in reference to the general assumption that the essence of a fable consists in setting before us the actions and speech of animals rather than those of mankind, as to what it is precisely which attracts us in this allusion. We cannot suppose, however, that there is after all much that is attractive in such a furbishing up of our humanity in animal form, even though it should exceed or at least differ from that of a comedy of apes and dogs, where, apart from the sight of the general cleverness of the dressing up, the entire interest consists rather in the deliberate contrast between animal nature as it really is and appears, and that represented as taking part in human affairs. On grounds of this sort Breitinger finds the attraction to consist entirely in the element of the *marvellous*. In the original type of the fable, however, the appearance of animals endowed with speech is *not* put before us as anything uncommon or surprising. And for this very reason Lessing is of the opinion that the introduction of animals is really of great use in helping us to understand and *assisting* the poet to *abridge* his exposition; in other words we are well acquainted with the qualities of animals, the cuteness of the fox, the magnanimity of the lion, the voracity and violence of the wolf, and are consequently able to set before our minds a concrete image in place of such abstract qualities. An advantage of this kind, however, in no essential degree mitigates the triviality of the relation when it has become one purely of form, and generally it is even a disadvantage to place animals thus before us instead of men, for the reason that the animal form remains a mask, which, so far as intelligibility is concerned, *veils* fully as much as it *declares* the significance.

The most important fable of this kind should be in that case the old history of Reinecke, the fox, which is notwithstanding strictly speaking no fable at all.

(*c*) In other words we may in conclusion add a *third* type of the fable, in which we find that there is already a tendency to pass beyond the real boundaries of the type. The ingenuity of a fable consists, as already pointed out, in the discovery of particular cases among the variety of natural phenomena, which we are able to use as evidential support of general reflections upon human action and behaviour, without essentially displacing the animal and natural world from its own native mode of existence. For the rest this general application or adaptation of the particular case to the so-called moral is an exercise of personal caprice, or shall we say native wit, and is therefore to all intents and purposes an affair of pleasantry. It is this aspect which receives the main emphasis in the type of fable now before us. The fable is in fact accepted as a witty jest. Goethe has written many a delightful and ingenious poem in this vein. The following lines occur in one of them, which is entitled "The Barking Dog":

Down every road afield we ride
On business bent or pleasure;
And ever in our wake full-cry
A hound's bark beats the measure.
Loosed from our horse's stable he
Will always gallop beside us:
And this is what his clamour proves!
We ride, are with the riders.

It is equally necessary here, as in the case of Aesop's fables, that objects which are borrowed from Nature should receive their native aspect, and only bring before us in their action and habits human circumstances,

passions, and traits, which have a close affinity to those of the animal world. The story of Reinecke is one of this kind, and is really more a fairy-tale than a fable in the strict sense. We find in the content of this the reflection of an age of disorder and lawlessness, of evil generally, weakness, baseness, violence, and shamelessness, of unbelief in religion, that merely retains the appearance of a mastery, or indeed an established position in the world-drama; and the result is that craft, cunning, and selfishness have it all their own way. It is, in fact, the condition of the Middle Ages, more especially as developed in Germany. The powerful vassals pay, it is true, some appearance of respect to the king; but practically every man does as he pleases — robs, murders, oppresses the weak, betrays the king, finds a way somehow to the favours of the queen, so that if the community just holds together that is about all. Such is the human content, which by this fable is preserved, not in a mere abstract proposition but in an entire *complexus* of conditions and characters, and by reason of its baseness fits in with the animal nature exactly, under the forms of which it is unfolded. For this reason we find nothing embarrassing in the fact that it is without any reserves transferred to the animal realm; and for the same reason the particular form it takes does not so much appear as an exceptional case cognate with it; rather we are inclined to feel the singularity of it make way for a certain breadth of universality, a vision emphasizing the general truth: "Such is the way things happen in the world." The comical side consists in the forms under which the whole is put together, drollery and jest being freely mingled with the bitter earnestness of the situation; the general effect of which is that we not only have human meanness admirably depicted through that of animals, but we are further made a present of the most entertaining traits, and most characteristic anecdotes wholly peculiar to animal life, so that, despite all tartness to the palate, our final view is that of

a comedy whose main intention is neither bad nor purely capricious, but one that has genuine earnestness to support it.

2. PARABLE, PROVERB, APOLOGUE

(*a*) *The Parable*

Parable has this general affinity with *fable*, that it accepts events from the circle of common life, but also makes them the depositors of a higher and more universal significance, expressly with a view that the same shall become intelligible and objective by means of that daily occurrence in its ordinary guise. A difference, however, at once asserts itself between the parable and fable, and it is this, that the former selects such occurrences in *human* action and habits, as we have them every day before our eyes, rather than in Nature and the animal world; it then expands the particular case selected, which appears trite enough at first as such a particular, to the range of wider interest, by suggesting through it a higher kind of significance.

For this reason the range and the importance of the significances in wealth of *content* can materially be increased and deepened[84], while, if we take the point of view of form, it is clear that the subjective process of intentional comparison and setting out of a generally instructive reflection already marks the acceptance and appearance of a more advanced type.

As a parable, still united to a wholly practical end, we may view the means of persuasion used by Cyrus to induce the Persians to rebel (Herod., I, cap. 126). His letter to the Persians advised them to betake themselves to a certain spot provided with sickles. When there he set them all on the first day to clear with hard labour a certain field overgrown with thistles. On the following day, however, after they had rested and bathed, he conducted them to a meadow and supplied them with ample cheer in the shape of food and wine. Finally, at the close of the feast, he asked of them which of the two days had proved the most enjoyable. All voted naturally for to-day

rather than yesterday; the former had brought them only good things, while the latter had been a day of weariness and toil. On this Cyrus exclaimed: "Follow me, and many will be the good days such as the present has brought you. Refuse to follow me, and countless labours are in store quite a match for those of yesterday." Of a type akin to the above, though of profoundest interest and the widest range considered relatively to their significance, are the parables we meet with in the Gospels. Take, for example, that of the sower, a narrative which as such possesses the most unimportant subject-matter, and whose significance centres throughout in the comparison it supplies to the preaching of the kingdom of heaven. The significance in these parables is wholly a religious gospel, to which the human occurrences, wherein such is imaginatively presented, stand in a relation similar to that between the animal and human world in the fables of Aesop, where the former elicits the meaning of the latter. Of a like breadth of content is the famous story of Boccaccio, which Lessing converted in his "Natham" into the parable of the three rings. The substance of the narrative is also in this case taken by itself nothing remarkable; the extraordinarily wide, reach of its content arises wholly from the way the differences between and the relative validity of the three religions, namely, the Jewish, the Mohammedan, and the Christian, are suggested by it. The same thing may be said of the latest novelties in this type of art, the parables of Goethe for example. Take that of the "cat-pasty." In this a famous *chef*, in order to prove himself hunter no less than cook, went out hunting, but shot a tom-cat instead of a hare, which he then served up to the company sauced with his most consummate art. This is no doubt a reference to the Light theory of Newton. We have here under the guise of the hare-pie which the cook tried in vain to elaborate out of a cat a reflection of that abortive type of physical science which the mathematician will assume to be something better than it is. These parables of Goethe frequently have a strong touch of drollery

about them, an aspect which they share with his fables by the help of which he was wont to shed himself of life's disappointments.

(*b*) *The Proverb*

The *proverb* forms as it were the middle point of this sphere. In the form of their execution, that is to say, proverbs lean at one time in the direction of the fable, at another to that of the apologue. They give us a particular case selected for the most part from the daily walk of mankind, which, however, is to be interpreted universally. Take the example, "One hand washes the other," or those others, "Every one wheels before his own door," "Who digs a grave for another, falls into it himself," "Bake a pudding for me and I will staunch your thirst," and others like them. To wise saws of this type belong the many apophthegems that Goethe has contributed to modern literature, often of exquisite grace and profound to a degree. These are not modes of comparison of the type that the general significance and the concrete phenomenon are opposed to one another in separation, but the former is immediately expressed with the latter.

(*c*) *The Apologue*

The *apologue* may be regarded as a parable, which not only serves in the way of *comparison* to render visible a general significance, but rather in this its very form reproduces and expresses the general moral, the same being actually included in the particular case, which is, however, related as only a single example. Conformably to this definition we may call Goethe's "Der Gott und die Bajadere" an apologue. Here we find the Christian tale of the repentant Magdalene reclothed in accordance with Hindoo ideas. The Bajadere[85] exemplifies the same humility, a like strength of love and faith; God puts her to the proof, an ordeal she completely sustains, and her exaltation and reconciliation follows. In the apologue also narrative is so extended that the outcome of it furnishes the moral itself, bare of any parallel to support it, as may be illustrated from "The Treasure-Finder":

Work by day and guests at night,
Weeks of moil, feasts of delight,
Such the Future's spell for thee.

3. THE METAMORPHOSIS[86]

The *third* mode we have to discuss in its contrast to the fable, parable, proverb, and apologue, is the *metamorphosis*. This is no doubt of a kind which is both symbolical and mythological; it sets forth, however, expressly furthermore the natural in its opposition to the spiritual. That is to say, it confers on an object immediately present to sense such as a rock, animal, flower, or spring the peculiar significance of being a *delapsus* and a *punishment* of spiritual existences. Such are the examples of Philomela, the Pieredes, Narcissus, and Arethusa, all of whom, through some false step, passion, transgression or the like, became subject to irreparable guilt or pain, and for this reason were deprived of the freedom of spiritual life, and united to the substance of physical nature. From one point of view Nature is not regarded merely under its external and prosaic aspect, simply, that is, as mountain, river-source, tree and so forth, but it further receives a content which is bound up with some action or event of spiritual life. The rock is not simply stone, but Niobe herself, who weeps for her children. From the other point of view this human action implies guilt of some kind, and this metamorphosis into the physical phenomenon is accepted as a degradation of Spirit.

It is therefore necessary to distinguish these metamorphoses of human individuals or gods very sharply from the genuine type of *unconscious symbolism*. To return to Egypt, for example, the Divine is here in part immediately envisaged in the mysterious and secluded intension of animal life, partly, too, the real symbol is here a natural form which is immediately associated with a wider significance cognate to it, despite the fact that this form is unable to supply the determinate existence fully commensurate with

it; and this is so for the reason that neither in respect to its form or its content has unconscious symbolism arrived at the free outlook of Spirit. Metamorphosis, on the contrary, emphasizes the essential distinction between Nature and Spirit, and by doing so marks the *passage* from that which is both symbolical and mythological to that which is in the *strict sense* mythological, under, that is to say, a conception of the latter, which, albeit that it proceeds in its myths from a concrete fact of Nature such as sun, sea, rivers, trees, earth, and the like, nevertheless, further and expressly sets this purely natural aspect on one side and apart, divesting such natural phenomena of their inner content and individualizing the same as a spiritual Power in the adequate artistic form of gods clothed in the lineaments of humanity, whether we regard them as external shape or spiritual activity. In this sense Homer and Hesiod have given to the Greeks their mythology, a mythology which by no means merely consists in the revelation of the significance of such gods, by no means is merely an exposition of moral, physical, theological, or speculative doctrine, but one that is a mythology in the strict sense, that is the origin of a spiritual religion under the genuine guise of our humanity.

In the Metamorphoses of Ovid the most heterogeneous material is brought together quite apart from the entirely modern spirit in which myth is treated. Beside the mere aspect of metamorphosis, which could here in general terms only be conceived as a kind of mythical representation, we have the specific character[87] of this type raised in an exceptional way in these narrations, in which embodiments of this sort, which are commonly accepted as symbolical, or are already received in their entirely mythical character, appear to have been converted into metamorphoses, and that which is elsewhere united is so presented as to assert an opposition between its significance and form, and the passage of the one into the other. In this way, for instance, the Phrygian or Egyptian symbol, the wolf, is so

separated from its intrinsic significance, that the same is converted into a previous existence if not actually into the kingship of the Sun, and the existence of the wolf is conceived as resulting from an act of that human existence. In the same way in the song of the Pierides the Egyptian gods, the ram, the cat, and so forth are imaged as such animal forms, in which the mythical gods of Greece, Jupiter, Venus, and the rest have concealed themselves from sheer fright. The Pierides themselves, however, by way of punishment, in that they dared to rival the Muses with their singing, are changed into woodpeckers.

Looked at from another side it is equally necessary, with a view to securing the more accurate definition, which the content wherein the significance consists essentially carries, that we distinguish the metamorphosis from the fable. That is to say in the fable the binding together of the moral with the natural fact is an association that is *harmless*; for in this the thing of Nature, regarded under the mode in which it differs in its natural aspect from Spirit, does not affect the significance, although there are certainly single examples of the fables of Aesop, which, with but slight alteration, would be instances of metamorphosis. As such may be cited the forty-second fable of the bat, the thorn-bush, and the diver, whose instincts are explained as due to the ill-luck of former experiences.

And here we must end our passage through this the first circle of the comparative type of art. It started from that which was immediately present to sense, that is, the concrete phenomenon. We proceed now from the point we have arrived at to examine a further kind of significance which the type unfolds.

B. COMPARISONS, WHICH IN THEIR IMAGINATIVE PRESENTMENT HAVE THEIR ORIGIN IN THE SIGNIFICANCE.

Forasmuch as the severation of significance from embodiment is the hypostasized form for consciousness, within which the relation of both originates independently, it is both possible and inevitable that in the articulation of the self-subsistency of one side no less than the other a start should be made not only from external existence, but conversely and as emphatically from that which is *immediately present* to the conscious subject, in other words general conceptions, reflections, emotions, and principles of thought. For this inward aspect is equally with the images of external objects a subject-matter present to consciousness and in its independence of that which is external proceeds on its way from its own resources. In the case, then, where we find the significance is the point of departure, the expression, that is, the reality, appears as the *modus formulandi*, which is abstracted from the concrete world in order to give a visible and sensuously defined shape to the significance regarded as abstract content.

Owing, however, to the reciprocally indifferent relation under which both sides confront each other, this association which binds the two sides together is, as we have already seen, no essentially explicit and necessary union; consequently the relation, such as it is, that is no actual reflection of objective fact, is rather a *product* of *active mind*, which no longer even disguises this its fundamental character, but rather deliberately exposes it in the form of its representation. The very embodiment possesses this binding together of form and content, soul and body, under the guise of concrete *animation*[88], as essentially and explicitly the substantial union of both sides in the soul as in the body, in the content as in the form. In the case before us, however, what is presupposed by consciousness is the dislocation of the two sides, and consequently their association is the vivification of the significance simply for consciousness by means of a shape external to it, and an indication of a real existence, equally subjective in its character

through the relation of the same to the general conceptions, emotions, and thoughts common to humanity. For this reason what is mainly emphasized in these forms of comparative art is the subjective art of *the poet* in his creative capacity, and in complete works of art we have mainly in our attitude to this particular aspect of them to separate that which strictly is appurtenant to their subject-matter and its necessary embodiment from that which is attached to them by the poet as mere ornament and embellishment. Such accessory detail, which we cannot fail to distinguish, that is, consisting mainly of images, similes, allegories, and metaphor, is precisely that part of his work in virtue of which he earns his title to fame with most people, a tendency which is all the more common because it indirectly bears witness to the insight and subtlety which enables such critics to discover our poet and draw attention to that aspect of his invention which is so entirely his own. But for all that, as we have already observed, in genuine works of art such forms as those we are discussing can only be regarded as accessory, although we doubtless do find in previous works on *Poetics* such incidental features treated as precisely those which go to make the poet.

Furthermore however, though unquestionably in the first instance the two sides which have to be associated stand in a relation of indifference to one another, yet in order to justify the subjective relation and comparison, the embodiments must also in the character of its content itself include the same relations and qualities under a cognate mode to that which the significance intrinsically possesses; the grasp of this similarity is, in fact, the one sure ground upon which the setting forth of the significance in union with this specific form rather than any other, and the envisagement of such import by its means is based. Lastly, inasmuch as we begin here, not from the concrete phenomenon, by the abstraction of a general characteristic from that, but conversely from this universal itself, which the intention is to have reflected in an image, the significance secures the

position which makes it stand out actually as the real object, and as such is predominant over the sensuous picture which is the *modus* of its envisagement.

The series in which we propose now to examine the particular types we have mentioned as belonging to this phase of comparative art may be indicated as follows:

First in order, as most cognate to the previous stage, the *riddle* will enlist our attention.

Secondly, we have to examine the *allegory*, in which as the main feature we shall find the abstract significance assert a mastery over the external form.

Thirdly, we have the class of the comparison in its strict sense; *metaphor, image*, and *simile.*

1. THE RIDDLE

The true symbol is essentially enigmatical in so far as the externality, by means of which a general significance is made apparent, still differs from the import it is intended to express: in other words it thereby raises the doubt as to what is the exact signification applicable to the form. The riddle, however, appertains to conscious symbolism, and an obvious distinction between it and the genuine symbol is to be found in the fact that in the former case the meaning is clearly and fully *recognized* by the propounder of it, and the form which veils that which is to be interpreted by it is therefore *intentionally* selected for this very purpose. The genuine symbol is both before and after the act of selection an unsolved problem, the riddle, on the contrary, is essentially a problem that is solved. It is therefore with very good reason that Sancho Panza exclaims: "I should much prefer to hear the solution first and the riddle afterwards."

(*a*) *First*, then, in the invention of the riddle, the point from which the process starts, is the apprehended meaning, the signification of it.

(*b*) The *second* step consists in the intentional selection of traits of character and other qualities from the common experience of the external world, which — such is always the aspect of Nature and external objects of every kind — are placed relatively to one another in piecemeal fashion, and in thus setting them forth in disparate contiguity, which makes their singularity the more striking. And inasmuch as they are so placed they are without the enfolding unity of mind, and their array and association intentionally distract has so far no intrinsic significance whatever. And yet for all that, and this is the other aspect of the riddle, they do expressly point to a unity in relation to which even traits to all appearance most heterogeneous contain, notwithstanding, both a real sense and significance.

(*c*) This unity, which may be styled the subject of these distract predicates, is just the simple preconception, the word that solves our riddle, to discover or divine which from the apparently confused medley of the mode under which it is propounded is the riddle's problem. Thus interpreted we may call the riddle the facetiousness of symbolism, aware that it is such which puts to the proof acuteness of insight and aptness at putting things together, and finally, by stimulating the zest of solution, breaks into and destroys the very mode of presentation it has itself set up. In the main we shall find this, form, therefore, most employed in human speech, though we may find exceptional examples of it also in the plastic arts[89], architecture, horticulture, and painting. With regard to its historical appearance the East is first and foremost responsible, and we may date its advent in that intermediate and transitional period out of the more obtuse type of symbolism into one of more intelligent knowledge and comprehension. Entire peoples and historical epochs have taken delight in the solution of such problems. It also plays an important part in the Middle Ages among the Arabs and the Scandinavians, and as a particular example it is much in evidence in the minstrel tourneys on the Wartburg. In modern times it is

mainly under the more modest guise of recreation and purely social pleasantry that we cross it.

In the riddle we have opened a practically limitless field for witty and striking conceits, which in their reference to any given circumstance, occurrence, or object take the form of a play upon words or an epigrammatical sentence. On the one hand we have presented an object trite to a degree, on the other some conceit of the mind which emphasizes unexpectedly with conspicuous force some aspect or relation, which we failed to perceive in that object on first confronting it, and which now attaches to it the light of a new significance.

2. THE ALLEGORY

The counterpart to the riddle in this sphere of comparative art, where the point of departure is from the generality of the significance, is the *allegory.* From a certain point of view this form, no less than the former, endeavours to make more visible to us the definite qualities of a general conception through qualities in materially concrete objects which are cognate therewith; but in contrast to that form this is not done in the interest of a partial concealment and a mysterious problem; rather it is now quite the other way with the express object of absolute revealment; to an extent, in fact, that all which is external, and is as such utilized by it, must become through and through transpicuous with the significance which has to make its appearance therein.

(*a*) It is therefore in the first place concerned to personify abstract conditions of a general character or similar qualities both from the human and the natural world, such as religion, love, justice, strife, fame, war, peace, the seasons, death, and the like, and conceive them under the mode of *personality.* This subjective aspect, however, is neither in respect to its content nor its external form in itself either a real subject or individual, but persists as the abstraction of a general conception, whose content is merely

the *barren* form of subjectivity which may be called as truly a grammatical subject[90]. In other words an allegorical being, despite every attempt to clothe it in the lineaments of humanity, entirely falls short of concrete individuality, whether it be a Greek god, a saint, or any other genuine example. It is, in fact, so forced to pare away[91] from the substance of subjectivity, in order to make it conform with the abstract character of its significance, that all the true definition of individuality disappears. It is therefore only a just criticism of allegory to say that it is frosty and cold, and, having regard to the abstract quality of its significances, even in the point of invention, that it is rather the result of the matter-of-fact understanding than that of the complete vision and emotional depth of genuine imagination. Poets, such as Virgil, for example, are particularly ready to give us examples of allegorical individualization simply because they are unable to create gods of the Homeric type of personality.

(*b*) *Secondly*, however, the significant character of allegorical material is at once *defined* in its abstraction, and only by means of such definition is it intelligible; the expression of such particular aspects, for the reason that it is not immediately unfolded in that which is in the first instance a purely *generalized* conception of personality, is consequently forced to appear alongside of the subject, simply as the predicates which elucidate the same. This separation of subject from predicate, generality from particularity, is the second feature of the frostlike appearance of the allegory. The envisagement of the determinate and specific qualities is borrowed from the modes of expression, activity, and resultant effects which make their appearance in virtue of the significance, when that secures its realized form in concrete existence, or from the various means which subserve it in its true realization. For example, war is delineated through weapons, cannons, drums, and standards, etc.; the yearly seasons, by an enumeration of the flowers and fruits, which pre-eminently spring up under the favouring

influence of the particular seasons. Objects of this kind may further receive purely symbolical relations, as, for instance, Justice may be brought home to our minds by means of the scales and fillet, Death by that of the hour-glass and scythe. For the reason, however, that the significance in allegory is the dominant factor, and the more specialized presentment is subordinate to it under an equally abstract form, for it is, after all, itself merely an abstraction, the embodiment of such definable characteristics only secures the validity of an *attribute* pure and simple.

(*c*) In this way the allegory is under both these aspects without vital warmth. Its general personification is empty, the definite mode of its externalization is only a sign, which taken independently has no longer any meaning, and the *centrum*, which is thus constrained to gather up the variety of the attributes into a focus does not possess the potency of a truly subjective unity which is itself self-embodied in its real and determinate existence inter-related throughout, but is rather a purely abstract form, for which the substantial filling-up with particular traits, which, as we have seen, never succeed in rising above the rank of the formal attribute, remains as something external. Consequently we may say that in so far as the allegory sets up any claim to real self-consistency, in which it personifies its abstraction and their delineation, it is not to be taken seriously. In other words, that which is both implicitly and explicitly self-substantive is unable really to conform with an allegorical being. The *Dikê* of the ancients, for instance, is not on all fours with allegorical individualization. She is universal Necessity personified, eternal Justice, the universally potent subject, the absolute substantivity of the relations which co-ordinate Nature and spiritual Life, that is, she is the absolute Self-subsistent itself, in the train of whom all other individuals are bound, whether gods or men. Herr Frederick von Schlegel has, it is true — we have already referred to the fact — ventured the opinion that every work of art must of necessity be an

allegory. Such an expression of opinion is only true if limited to the sense that every work of art must contain a general idea and a significance which is itself essentially true. What we have above, on the contrary, included under the term allegory is a mode of presentation which only conforms to the notion of art incompletely, being itself no less in content than in form subordinate to it. Every human event and development, every relation in which life is concerned, possesses no doubt intrinsically an aspect of universality, which may be emphasized as such, but abstractions of this kind are already to be found in the general contents of consciousness, and merely to assert them in their prosaic aspect of generality and external delineation, which is the point where the allegory halts, is still to fall short of the true sphere of art.

Winckelmann has also written an immature work on allegory, in which he has ranged together a large number of examples, but failed for the most part to distinguish those which exemplify the symbol and allegory respectively.

Among the particular arts within which we find examples of the allegory, poetry is really acting contrary to its laws when it takes refuge in such a mode of presentment; sculpture on the contrary is in most directions barely complete without it, more especially modern sculputure, which freely admits of that which is native to portraiture, and so must avail itself of allegorical figures in order to delineate more closely the relative aspects under which the individual presentment is posed. On Blucher’s monument, for example, which has been raised to him here in Berlin, we find both the genius of Fame and Victory, although, having regard to the general treatment of the war of liberation, this allegorical aspect is once more set aside by means of a series of particular scenes such as the departure of the army, its march, and victorious return. Generally speaking, however, where the subject of sculpture is portraiture the sculptor will avail himself gladly

of allegorical representation as offering to the simplicity of his central figure the contrast of environment and variety. The ancients on the other hand, on their sarcophagi for example, more frequently made use of general mythological representations of such figures as Sleep, Death, and the like.

Allegory generally is far less common in the antique than it is in the romantic art of the Middle Ages, although it must be added that such romance as it possesses is not really referable to allegory. The frequent appearance of allegorical conception at this particular epoch of human history is to be thus explained. From a certain point of view we find that the content of the Middle Ages is preoccupied with particular types of individuality and the personal aims, generally focussed in love and honour, and resulting in vows, wanderings, and adventures, which are common to them. Individuals of this type and the events of such lives invariably offer the imagination a wide scope for the inventive faculties, and the composition of accidental and capriciously imagined collisions and their resolution. On the other hand, in direct contrast to this motley show of worldly adventure we have the universal, taking it here as the stability of the ordinary relations and conditions of life, a universal which is not, as was the case in the ancient world, individualized in the figures of self-subsistent gods; consequently we find it freely and naturally emphasized in independent isolation as such universality alongside of these particular types of personality and their specific modes of appearance and activity. If the artist therefore happens to have before his mind the general conditions of life we have adverted to, and assuming that he is desirous of giving artistic embodiment to them in some form other than the accidental mode common to his age, that he wishes, in short, to emphasize their universality, he has no other alternative than to accept the allegorical type of presentment. This is precisely what we find in the sphere of religion.

The Virgin Mary, Christ, the actions and dramatic events of apostolic history, the saints with their penances and martyrdoms, are, it is true, even here individualities in the full sense; but Christendom is also to an equal extent concerned with the general conceptions of abstract spiritual qualities, such as will not comply with the concrete definition of actual persons inasmuch as the relation of *universality* is precisely the mode under which they are presented, of which examples are Love, Faith, and Hope. And generally the truths and dogmas of Christendom are independently cognized by the religious consciousness, and a main interest even of their poetry consists in this that these doctrines are emphasized in their *universal* aspect, that Truth is known and believed in as *universal* truth. In that case, however, it is necessary that the concrete presentation should remain a subordinate factor, itself external to the content, and allegory is just the form which satisfies this want in the easiest and most sufficient way. Conformably to this the divine comedy of Dante is full of allegorical matter. Theology, for example, in this poem is run together in fusion with the image of his beloved lady Beatrice. This personification, however, wavers in the lines of its delineation; and this uncertainty of outline is that which constitutes the beauty of it, and places it halfway between genuine allegory and a vision of his youthful love. In the ninth year of his life he looked on her for the first time: she appeared to him no daughter of mortal men, but of God. His fiery Italian nature conceived a passion for her, which the years failed to extinguish. And conscious that it was she who awoke in him the genius of poetry he finally sets himself the task, after he had lost in her that which was most loved in the fairest flower of its promise, of composing that wonderful monument of the most intimate and personal religion of his heart in the poetic masterpiece of his life.

3. METAPHOR, IMAGE, SIMILE

The *third* sphere of content attached to the riddle and the allegory consists in the *imaged thing* generally. The riddle veiled the still independently cognized significance and the mode of its shaping in cognate, albeit heterogeneous and distantly placed traits of definition was still of most importance. Allegory on the contrary emphasized the perspicuity of the significance so strongly as the predominant aim, that the personification and its attributes appear deposed to the rank of mere signs. The imaged thing now connects this clarity of allegorical expression with that impulse of the riddle to envisage the significance which stands out clearly before the mind in the form of an externality cognate with it; the result, however, is not that it gives rise to problems which have first of all to be solved, but rather that the imaged shape appears, by means of which the preconceived conception is revealed with absolute transparency, notifying itself as that which it really is.

(*a*) *The Metaphor*

The *first* point we have to draw attention to in the *metaphor* is this, that it may be accepted at once as essentially a simile, in so far as it expresses clear and self-subsistent significance in a similar phenomenon of reality comparable with it. In the comparison as such, however, both sides of the comparison, that is the real meaning and the image, are definitely kept apart from each other, while on the contrary in the metaphor this separation, albeit it is essentially present, is *not* as yet clearly *posited.* For this reason Aristotle long ago distinguished comparison and metaphor by his statement that a "how" is added to the former which is absent from the latter. In other words the metaphorical expression specifies but *one* aspect, the image. In the context, however, to which the image is attached, the real significance which is intended lies so near that it is at the same time immediately asserted without any direct separation of it from the image. When it is said, for example: "the Spring-time of these cheeks," or "a sea of tears," we are

inevitably forced to accept such an expression as an image rather than an actual fact, an image whose significance the context at the same time expressly designates. In the symbol and allegory the relation of actual meaning to external form is not asserted either so immediately or necessarily. From the fact that an Egyptian staircase consists of nine stages, and a hundred other circumstances of similar pregnancy, it is only the adept, the connoisseur, and the professor who will derive a symbolical significance, and doubtless will scent out and discover much that is both mystical and symbolical into the bargain, which is so much ingenuity of research thrown away for the reason that what is discovered is not there. This may have happened often enough to my honoured friend Creutzer, no less than our latter-day Platonists and the commentators of Dante.

(*a*) In range and variety of form it is impossible to exhaust the resources of metaphor; its definition, however, is simple. It is a wholly abbreviated comparison, in which we find, as a fact, image and significance are not as yet set in opposition to one another, but only the image is introduced by it; at the same time, however, the meaning which is thus attached to the image is not its real meaning; this is as it were effaced, and by virtue of the content in which it is set we are enabled to recognize the significance which is really intended in the image itself, albeit that meaning is not expressly asserted.

For the reason, however, that the meaning that is thus rendered intelligible under the image only comes to light by virtue of the context, the significance which is expressed in metaphor cannot claim the importance of an independent artistic presentation; their mode of appearance is purely incidental, so that metaphors, in a still more emphatic degree, can only be employed as the external embellishment of an essentially independent work of art.

(*β*) The metaphor is mainly used in the expressions of speech, which we may usefully consider in this relation under the following aspects.

(*αα*) In the first place every language includes within its own compass a host of metaphors. They arise from the fact that a word, which in the first instance merely designates something entirely sensuous, is carried over into a spiritual sphere. "*Grasp*", "*comprehend*"[92], and generally a number of words connected with the processes of thought, have in regard to their original meaning a content that is wholly sensuous, which is consequently abandoned and exchanged for the meaning applicable to mind; the first meaning is sensuous, the second spiritual.

(*ββ*) By degrees, however, the metaphorical aspect disappears in the general use of such a word, which as the current coin of language is converted from an expression which is not strictly accurate to one that is so, the effect of this process being that image and import, owing to the habitual frequency with which the latter is only conceived in the former, cease to differ from one another, and the image merely immediately presents the abstract significance itself instead of a concrete mode of vision[93].

When we take, for example, the word "grasp" in the sense applicable to mental life it entirely escapes us that there is any sensuous relation implied between the hand and external objects[94]. In living languages this distinction between genuine metaphor and words which already through usage have fallen to the level of a mere means of expression is readily established; the reverse is the case with dead languages, for the reason that here mere etymology is unable finally to bring our minds to a decision, inasmuch and in so far as the question does not depend on the original source of that word, and its general development in speech, but first and foremost on the fact whether a word which has all the appearance of being used in a picturesque and metaphorical sense had or had not already lost by habitual usage under

a meaning applying exclusively to spirit, and in the speech when alive, its first sensuous significance and been absorbed wholly in that higher sense.

(*γγ*) When this takes place the invention of new metaphors, which are the exclusive product of the poetical imagination becomes for the first time a vital necessity. That in which this invention is mainly concerned consists *first* in transferring the phenomena, activities, and conditions of a higher level of fact in a way that illustrates the content of less important material, and in bringing to light significances of such inferior matter in the form and image which stands above them. The organic, for example, is by itself essentially of higher importance than the inorganic, and to carry forward that which has no life within, the range of vital phenomenal enhances its expression. We may illustrate this with the saying of Ferdusi: “The keenness of my sword *devours* the brain of the lion, and *drinks* the dark blood of the courageous.” In a yet more enhanced degree we find the same result when that which is of Nature and sensuous is imaged, and thereby raised and ennobled in the form of *spiritual* phenomena. So we have such common turns of speech as “*smiling* fields,” and “*angry* flood,” or in the language of Calderon: “The waves *sigh* beneath the burden of ships.” In these examples that which exclusively applies to humanity is diverted to the expression of Nature. The Latin poets use such metaphorical language often enough, as we may find in our Virgil, take the example: *Quum graviter tunsis gemit area frugibus* (Georg., III, 132).

Conversely and in the *second* place that which pertains to mind is brought in the same way more close to our powers of vision through the image of natural objects. Such fanciful presentations, however, can very readily degenerate into mere trifling and far-fetched conceits, when that which is essentially without life receives notwithstanding every appearance of individuality, and really spiritual activities are assigned to it with perfect seriousness. The Italians more especially have given themselves over to

illusive trickery of this kind, and even Shakespeare is not wholly free from them, as in that passage from "Richard II" (Act V, sc. I), where he makes the King say to the Queen on parting:

For why, the senseless brands will sympathize
The heavy accent of thy moving tongue
And in compassion weep the fire out;
And some will mourn in ashes, some coal-black
For the deposing of a rightful king.

(*γ*) Finally, if we look at the aim and interest of that which is metaphorical, the first thing which strikes us is that a word in the strict sense is an independently intelligible expression, the metaphor otherwise. The question consequently presents itself, what is the reason of this twofold means of expression, or, to put it another way, why is it that we have the metaphorical which essentially implies this division? The common explanation is that metaphors are used to give vivacity to poetical composition, and this animating effect is the ground in virtue of which Heyne, in particular, insists on their value. The vivacity consists in the support they offer to imaginative vision in the direction of clear definition, divesting the word, which is always something generalized, of its purely indefinite character, and bringing it home to sense by means of an image. No doubt a greater degree of vivacity is to be found in metaphors than in the strict expressions of ordinary speech; genuine vitality, however, is not to be sought for in metaphors, whether in isolation or combination, whose figurative plasticity, it is true, may frequently include a relation, which by good chance attaches at the same time to the expression an increased perspicuity and a higher definition, but quite as often, if every detail of the process of thought is thus figuratively emphasized in isolation, makes the whole unwieldy, overloading it thus with its emphasis on singular aspects.

The genius of metaphorical diction is consequently, as we shall have to elucidate more closely in our consideration of simile, to be regarded as responding to a need and potency of mind and the emotional life, which will not rest satisfied with that which is entirely simple, ordinary, and homely, but make an effort beyond this and over into something more recondite under the attraction which distinction offers and the impulse to co-ordinate contrasted effects. This binding together has itself again various causes, which may be notified as follows.

(*αα*) *First*, we have it for the sake of *reinforcing* an effect. The emotional life, under the pressure and movement of its passions, gives visible utterance to these forces by means of the piling up of sensuous image. More than this, it strives to express its own whirl and tumble, or persistence in the ideas which crowd upon it by means of a similar letting itself go into phenomena cognate with such a condition, and its own free movement among images of the greatest variety. In Calderon’s supplication to the Cross Julia utters the following words when she looks upon the dead body of her only just deceased brother, and her lover, Eusebio, the man who has killed Lisardo, stands before her:

O that I might close for ever
Eyes before this blood here guiltless,
Blood which cries for vengeance with its
Flooding stream of purple flowers!
Would that I could deem thee pardoned
In the rush of tears that blind thee:
Wounds and eyes are mouths which swallow
Lies which seek admittance never, etc.

With a still more vehement burst of passion Eusebio starts back from the sight of her, when Julia finally is for surrendering herself to him, as he

exclaims:

Flaming sparks thine eyeballs scatter;
Every sigh is breath that scorches;
Every word is a volcano,
Every hair a scribbled lightning,
Every word is Death, and every
Soft caress is Hell's own anguish;
Such the horror stirs within me
As I see — O awful symbol,
Crucifix thy bosom carries.

The human soul on the swell of its emotion keeps adding image on image to that immediately confronting it, and with all this impetuous seeking to and fro for new means of expression barely lays to rest its own tumult.

(*ββ*) A *second* rationale of the metaphorical consists in this that the human soul, after adding to its own depth by this the motion of its own life into the varied survey of objects cognate with it, is stirred at the same time to cast itself free of the externality of such objects, to the extent that it seeks to rediscover itself in what is external; it transmutes that external in its own free activity, and by clothing both itself and its passions in the forms of beauty, proclaims furthermore its power to present in visible semblance its own exaltation above the bare fact.

(*γγ*) A *third* ground of figurative expression, and one of at least equal force, may be found in the purely ribald exuberance of the phantasy, which is unable to set before us an object in its own outlines for what they are worth, or a significance in its unadorned simplicity, but on all occasions hankers after some concrete embodiment cognate with it, or is overmastered by the ingenuity of a personal caprice, which, in order to escape the

commonplace, abandons itself to the charms of the piquant novelty, a caprice that is never satisfied until it has discovered for us points of affinity in material the most remote apparently from that before us, and has thereby related the same to the most distant objects.

And we may here observe that it is not so much the *prosaic* and *poetic* style generally as the style of the *classic* world in contrast with that of later periods which presents such a marked difference in the pre-eminent importance they attach to genuine or metaphorical expression respectively. It is not merely the Greek philosophers, such as Plato and Aristotle, or the great historians and orators, such as Thucydides and Demosthenes, but also the great poets, Homer and Sophocles, who, albeit we find examples of the simile in all them, remain on the whole, and without exception, constant in the use of their direct form of expression[95]. Their plastic severity and sterling substance will not permit them such a multifarious product, as is bound up with the use of metaphor, nor will it suffer them, even for the sake of gathering the so-called flowers of expression, to waver fitfully in devious ways from their ideal mintage of the completely simple and co-ordinate result as of one metal cast in one mould. The metaphor, in fact, is always an interruption to the logical course of conception and invariably to that extent a distraction, because it starts images and brings them together, which are not immediately connected with the subject and its significance, and for this reason tend to a like extent to divert the attention from the same to matter cognate with themselves, but strange to both. The prose of ancient writers in the extraordinary clarity and flexibility of its utterance and their poetry in the repose of its completely unfolded content[96], are equally removed from the frequent use of metaphor by modern writers.

On the other hand it is particularly in the East, and above all the later literature of Mohammedan poetry, which makes use of the indirect or figurative modes of expression, and, indeed, finds them essential. The same

thing may be said, if less emphatically, of modern European literature. The diction of Shakespeare, for instance, is full of metaphor. The Spaniards, too, are very fond of this flowery region, and, indeed, have wandered off into it to the point of the most tasteless exaggeration and superfluity. Jean Paul falls under the same charge. Goethe by virtue of the equal strength and clarity of his vision to a less extent. Schiller, however, is even in his prose exceedingly rich both in image and metaphor; in his case this is rather due to his effort to bring really profound ideas within the range of the imaginative vision without being forced to expound all they imply for the mind in the technical language of philosophy. We behold and find there the essential unity of the speculative reason reflected on the mirror of Life as it stands before us.

(*b*) *The Image*

We may place the *image* midway between the metaphor and the simile. It has, in fact, so close an affinity with the metaphor that we may regard it as merely a metaphor *fully amplified*[97], an aspect which at the same time marks its very close resemblance to the simile; there is, however, this distinction, that in the case of the image as such the significance is not set forth in its independent opposition to the concrete external object expressly compared with it. That which we term the image arises when two phenomena or conditions, which by themselves stand substantially apart, are placed in concurrence so that one condition supplies the significance which is made intelligible by means of the other. The first, that is to say, the fundamental *modus* of the definition constitutes here the relation of *independent consistency*[98], and is the line of *division* of the spheres in their separation, from which both the significance and its image are deduced; and that which is common to them, the qualities and relations and so forth, are not, as in the symbol, the indefinite universal and substantive itself, but the self-defined concrete existence on the one side no less than on the other[99].

(*a*) Under a relation such as this the image may possess as its significance a whole series of conditions, activities, contrasts, and modes of existence, and manifest the same through a series of a similar nature from an independent if cognate source, without emphasizing in so many words the significance as such within the limits of the image. The poem of Goethe, entitled "The Song of Mahomet," is of this kind. It is merely the title here which shows us that in the image of a rocky water-spring which, in the freshness of youth, leaps over the cliff's edge into the abyss, and which then spreads away with the rush of tributary springs down the plain, ever and anon taking up fraternal rivers, which gives further a name to localities, and sees whole towns subject to its glory, until it finally bears in the tumultuous folds of its rapturous heart all these splendours, the brothers, its possessions, its children, to the great source that awaits them — it is, we repeat, merely the title which explains to us that in this comprehensive and radiant image of a mighty river we have the first bold appearance of Mahomet, then the rapid spread of his teaching, and, finally, the deliberately planned attempt to bring all nations to the *one* faith set forth with such singular directness. We may view in a similar way many of the Xenien of Goethe and Schiller, those sentences edged in part with scorn, but as often the mere vehicle of good spirits, which were flung at the public and its weak authors in particular. Take the pair of distiches which follow, as an example:

Stille kneteten wir Salpeter, Kohlen und Sewefel,
Bohrten Röhren, gefall' nun auch das Feuer work euch!

Einige steigen als leuchtende kugeln und andere zünden,
Manche auch werfen wir nur spielend das Aug' zu erfreun[100].

Ay, we have in truth seen not a few rockets of this order changed to dull ash, to the exceeding entertainment of the better half of public opinion, only

too delighted when the rabble of commonplace and miserable quality, which had for a long time spreadeagled it far and wide and laid down the law, received a genuine smack in the mouth and a bucket of cold water over its precious body into the bargain.

(*β*) In these last examples there is, however, already a *second* aspect brought to view, which in our consideration of the image should be emphasized. In other words the content is in these cases an *individual* which acts, brings before us objects, experiences specific states, etc., and then is reflected in the *image* not as such a subject, but merely with a reference to his particular actions, workings, and experiences. The individual himself as subject is, on the contrary, introduced without an image, and it is only his actions and relations strictly viewed which contain the form of indirect expression. Here, too, as in the case of the image generally, it is not the *entire* significance which is separated from its mode of embodiment, but the subject is alone set forth independently, while the definite content of that subject receives at the same time the form of an image; and the result is that the subject is imagined in such a way as though it was itself the means which supplied the imaged form of their existence to the objects and actions in question. The metaphorical relation is, in fact, ascribed to the individual subject expressly named. This confusion, or at least interfusion of the direct and indirect modes of expression has frequently been the subject of adverse criticism, but we do not find very solid ground to support it[101].

(*γ*) Orientals are to an extraordinary degree distinguished by the bold use they make of this type of imagery. They will unite together and intertwine in one image entirely *independent* forms of existence. Take for example this sentence of Hafiz: “The life-course of the world is a bloodstained dagger, and the drops which fall therefrom are crowns.” Or that other: “The sword of the sun drips in the red of morning with the blood of Night, over which it has won the victory.” Or again this: “No one has yet drawn aside the veil

from the cheeks of thought as Hafis since the day when the tips of the locks of the Word's bride were curled." The meaning of this image may be apparently thus expanded. Thought is the bride of the word; so Klopstock calls the word the twin-brother of Thought, and since this bride has been adorned by man with delicately turned words, no one is likely to be more competent than Hafis to suffer the thought thus adorned to appear in the clarity of its unveiled beauty.

(*c*) *The Simile*

From this last type of imagery we may proceed without a break to the consideration of *simile.* For in the image we already find the initial appearance of the independent and imageless expression of this significance, the subject of the image being here designated. The two types are, however, distinguished by this that in the simile everything which exclusively manifests the image in a figurative form is furthermore able to receive an independently subsistent mode of expression as significance, which thereby appears alongside of its image and is placed in comparison with the same. The metaphor and image declare the significances without making that declaration explicit, so that it is only the context, in which either metaphor or image occur, which shows without disguise what their meaning veritably is intended to be. In the simile, on the contrary, both aspects, image and significance, albeit no doubt we find at one time it is the image, and at another the significance which is most clearly and fully emphasized, are kept completely apart and set forth each in its isolation, and only then, and in such severation are related to one another in virtue of the similarity of their content.

Viewed in this relation it is possible to characterize the simile as to some extent merely a vain *repetition*, in so far, that is, as one and the same content is reproduced in a twofold, or it may be threefold or fourfold form. In part, too, we may even see in it a frequently wearisome *superfluity*, for

the reason that the significance is already there as an independent factor, and requires no further mode of figuration to render it intelligible. The question consequently presses upon us here with even more insistence than in the case of the image and metaphor, what essential interest and object there may be in the employment of isolated examples or a whole number of similes. For their use is not to be justified on the commonly received ground of mere vivacity, and the contention that they increase the lucidity of expression will assist us just as little. On the contrary similes make a poem only too frequently insipid and overweighted, and an image or metaphor by itself can possess a clarity fully as pronounced without there being any previous necessity to attach the significance to either as something still outside.

We must consequently conceive the object of the simile to consist in this, that the subjective[102] imagination of the poet, however much it has brought home to the artist's consciousness the content, which it seeks to express, with distinctive emphasis according to its more abstract generality and expresses it in this universal aspect, yet it finds itself equally under a constraint to seek out a concrete form for it, and to envisualize for itself in the phenomena of sense that which already is clearly before the mind as its significance. Looked at in this way we shall find that the simile is, no less than the image and the metaphor, indicative of the bravery which invariably distinguishes imaginative power when it faces its object, it matters not what, it may be a single object of sense-perception, a definite condition, or a general significance — the enterprise, that is, to bind together with its own activity that which lies remote from it in its external environment, and by so doing to carry away by force objects of the greatest variety, and unite them to the interest which its unified content possesses, and generally to annex to the matter in hand a whole world of diversified phenomena. And this power of the imagination continually to find out the new plastic shape, and cement

together heterogeneous material by means of the relations and associations of sense is, in general terms, also the rational basis of the simile.

(α) In the *first* place, then, this impulse to compare can find satisfaction simply by virtue of the demand which it satisfies, without bringing to light, that is to say, anything else in the brilliancy of its images than the bravery of the imagination itself. And this is but the same thing as that revelry[103] of imaginative power, which, more particularly in the East, with all the easy-going tranquillity of the South regales itself in the wealth and splendour of its images nor seeks any other object, while it seduces the hearer to give himself up to the same spirit. At the same time we are frequently astounded by the amazing force, with which the poet surrenders himself to ideas of the most startling contrasts, and displays a cunning of combination which far exceeds all the effort of mere wittiness as an indication of genius. Calderon, too, supplies us with many comparisons of this type, more particularly in his pictures of important and splendid pageants and festive processions, in his descriptions of chargers and cavaliers, or in his reference to ships, which on one occasion he calls "birds without pinions, and fish without fins."

(β) A *second* and more intimate aspect of these comparisons is that in virtue of which we find them to be a *tarrying by* one and the same object, which becomes thereby the substantial centre of a series of other ideas remote from it, by pointing to or illuminating which the interest of the content compared receives a tangible increase.

This protraction of the interest round one centre may be explained in several ways.

($\alpha\alpha$) As the *first* we may draw attention to the *absorption* of the soul in the content, which is the source of its *animation*, and which attaches itself so intimately to it, that it is unable to detach itself from the permanent interest thus excited. We may at the same time observe that a fundamental

difference once more asserts itself in this respect between the poetry of the East and the West resembling that we have already adverted to our discussion of Pantheism. In other words the Oriental is in his absorption less dominated by the personal relation, and consequently without the languish and yearning of self-interest: his longing, such as it is, remains a more impersonal delight in the object under comparison, and consequently more of a contemplation. He looks about him with a free mind, sees in everything which surrounds him, everything which stirs either his mental faculties or his heart, an existing image of that which actively concerns his sense-life and his spiritual forces, and with which he abounds. This type of the imagination which is free from all mere self-obsession, delivered, I mean, from all morbid introspection discovers its satisfaction in the figurative conception of the object itself, and most of all when that object, by virtue of the comparison instituted, is extolled, exalted, and declared in line with that which is most glorious and beautiful. The West is in its general contrast more remote from this impersonal spirit, and in its grief and pain more inclined to languish and yearn itself away.

This dallying, as we may call it, is then pre-eminently an interest of the *emotional* life, more particularly of love, which delights to take refuge in the objects of its suffering and its raptures; and as often as it finds itself unable to break loose from such feelings finds naught that is wearisome in the task of repainting the object ever anew. The lover is above all things the prodigal in wishes, hopes, and ever changing conceits. Among such conceits we have to reckon the simile, to which love and the emotions generally have recourse, all the more readily for the reason that they take up and absorb the entire soul, and are themselves the independently motive source of comparison. Whatever is their immediate content, is, that is to say, a beautiful object arrested in its singularity, whether it be the mouth, the eye, or the hair of the beloved. In such a state the human soul is active,

restless, and the states of joy and pain are neither without life nor in repose, but full of activity and motion, are up and down, which at least is continuous in this that it is for ever bringing all material of whatever kind into relation with the one emotional centre of the world of the heart. In other words the interest of comparison has its root in the feeling itself, which is insistently conscious of the fact, for example, that there are other objects in Nature which are beautiful, or have given rise to pain and so on. Consequently love draws these objects with the aid of the simile into the sphere of its own content, and makes the same wider and more universal thereby. If the object of the simile is, however, entirely *isolated* in its *material* form, and brought into juxtaposition with objects of a similar nature, we shall find, and particularly so where similes of this sort are piled one on the top of another, that such a composition is due to emotion of a still rather superficial order, and to reflection equally wanting in depth; the result will be that the variety which merely plays round an external material will readily appear to us insipid and of no vital interest, because we have here no spiritual relation interpenetrating it. We may illustrate such an effect from the fourth chapter of the Song of Solomon where we find the words: "Behold thou art fair, my love; behold, thou art fair; thou hast doves' eyes within thy locks; thy hair is as a flock of goats, that appear from mount Gilead. Thy teeth are like a flock of sheep that are even shorn, which came up from the washing, whereof everyone bear twins, and none is barren among them. Thy lips are like a thread of scarlet, and thy speech is comely: thy temples are like a piece of pomegranate within thy locks. Thy neck is like a tower of David builded for an armoury, whereon there hang a thousand bucklers, all shields of mighty men. Thy two breasts are like two young roes that are twins, which feed among the lilies[104]. Until the day break and the shadows flee away." This *naïveté* is to be met with in many of the comparisons of Ossian. Take for example the words: "Thou art as snow

on the heather; thine hair is as mist on the kromla, when he curls himself up on the rock, and glistens toward the gleam in the West; thine arms are as two arrows in the halls of the mighty Fingal."

Of the same kind, only here in wholly a rhetorical way, are the following words Ovid places in the mouth of Polyphemus (Met. XIII, vv. 789-807): "Thou art more white, O Galatea, than the leaf of the snow-white meadowland; more blooming than the fields, more slender than the elm; more brilliant than glass, more arch than the tender little roebuck; smoother than the shell ever-polished by the sea; more dear than Winter's sun, or the shade in Summer; nobler than the fruit-tree, more comely than the lofty plane." And so on through all the nineteen hexameters, a description not wanting in rhetorical beauty, but as the presentation of an emotion, which rouses little interest, itself equally lacking in interest.

We may find many examples of this style of comparison in Calderon, although a halt, by the way, of this kind is more suitable to lyrical emotion simply, and fetters the march of drama far too insistently, if it is not actually motived by the subject-matter. Don Juan, for instance, during the progress of the action, describes at length in this way the beauty of a veiled lady whom he had followed. This is what he says to a third person:

Natheless in despite and often
Through the gross and barriered darkness
Of that intranslucent veil,
Flashed a hand of sheen most splendid,
Mistress pure of rose and lily,
Princess, to whose matchless glory
E'en the snow's gleam paid obeisance,
Slave all murk of Aethiop moulding.

The matter is wholly different, however, when any one capable of *profound* emotion, expresses his life through images and similes, in which the most secret folds of spiritual feeling are unveiled, the soul here either identifying itself with some scene of external Nature, or making such a scene the counterfeit of a spiritual content. We may cite Ossian once again in illustration of this better use of image and comparison, although the range of objects which serve him in such similitude is jejune, mainly restricted to clouds, mists, storms, trees, streams, thistles, grasses, and other facts equally obvious. Here is one of them: “The Present[105] brings joy to us, O Fingal; it is as the sun on Kromla, when the hunter has mourned its absence a whole year long and now it breaks forth from the clouds.” In another passage of the same writer we find these words: “Did not Ossian hearken but now to a voice? Is it then the voice of the days that are no longer? Ofttimes, oft as the evening suns, comes the memory of times that are gone into my soul.” And for another instance take this bit of narration: “Pleasant are the words of song, saith Kuchullin, and dear to the heart are the tales of times far away. They are as the quiet dew of the morning on the hill of the roe-deer, when the sun trembles faintly on his flank, and the pool lies motionless and blue in the dale.” In the case of Ossian this halting by the same emotions, and their similitudes expresses the attitude of an old age which out of weariness and exhaustion turns to sorrowful and painful memories. And generally a recourse to comparisons is evidence of an inclination to melancholy and effeminate emotion. The desire and interest of such a soul lies far away and foregone; and for this reason we find as a rule that, instead of bracing itself up manfully, it yields to its longing to lose itself in something else. Many of the figurative expressions of Ossian consequently are quite as much a response to this wholly personal mood as they are a reflection of ideas mostly of a mournful colour, and of the restricted circle beyond which he is unable to pass.

But, conversely, it is quite possible that *passion*, in so far as it is able to concentrate its forces on one content, despite its own unrest, with the object of finding a counterfeit of the soul in the natural world around it, may fluctuate to and fro in a variety of images and similitudes, which are all purely conceits of the fancy over one and the same object. A fine example of this we have in that monologue of Juliet from "Romeo and Juliet," in which she apostrophizes the night as follows:

Come, night; come Romeo; come, thou day in night;
For thou wilt lie upon the wings of night
Whiter than new snow on a raven's back:
Come, gentle night, come, loving, black-brow'd night,
Give me my Romeo; and when he shall die,
Take him and cut him out in little stars,
And he will make the face of heaven so fine
That all the world will be in love with night
And pay no worship to the garish sun.

(*ββ*) The similes of epic poetry as they come before us over and over again in Homer stand out in a marked contrast to the above type of almost purely lyrical simile in which sentiment is absorbed in the heart of its content. In the former case the aim of the poet, when he may by any chance wish to dally with the comparative mode around some specific object, is, on the one hand, interested in raising us over the active curiosity, expectancy, hope, and fear, by which we are moved relatively to the several situations and exploits of his heroes during the actual progress of events over, that is to say, the general concurrencies of cause, action, and consequence, and in fixing our attention upon the images which he places before us in their plastic repose, purely for our contemplation, serene as the works of sculpture. This repose, this absolution from the merely practical interest that

we may enter into that which he places visibly before our eyes comes upon us with all the more force in so far as everything with which he compares the object is taken from a field entirely remote from it. Moreover, this halting round the simile possesses the further significance that by virtue of this kind of twofold painting of the same object its importance is emphasized, and is thus not permitted to be whirled away in the mere shifting stream of the song and the events it celebrates. Take, for example, what Homer says of Achilles, when that hero, fired with anger, confronts Aeneas ("Iliad," XX, vv. 164-175):

As when the harmful king of beasts (sore threatened to be slain
By all the country up in arms) at first makes coy disdain
Prepare resistance, but at last when anyone hath led
Bold charge upon him with his dart, he then turns yawning head,
Fell anger lathers in his jaws, his great heart swells, his stern
Lasheth his strength up, sides and thighs waddle with stripes to learn
Their own power, his eyes glow, he roars, he leaps to kill,
Secure of killing: so his power then rous'd up to his will
Matchless Achilles, coming on to meet Anchises' son[106].

Much in the same spirit he speaks of Pallas, when she averted the arrow which Pandaros had let fly against Menelaus ("Iliad," IV, vv. 130-131):

"She did not forget him, and warded off the arrow e'en as a mother flicks away some fly from her son, as he lies in sweet slumber."

And again further on when the arrow, notwithstanding, wounds Menelaus (vv. 141-146):

Yet forth the blood flow'd, which did much his royal person grace,
And show'd upon his ivory skin, as doth a purple dye

Laid, by a dame of Caïra, or lovely Maeony,
On ivory, wrought in ornaments to deck the cheeks of horse;
Which in her marriage room must lie; whose beauties have such force,
That they are wish'd of many knights, but are such precious things,
That they are kept for horse that draw the chariots of kings;
Which horse, so deck'd, the charioteer esteems a grace to him;
Like these, in grace, the blood upon thy solid thighs did swim,
O Menelaus, etc[107].

(γ) A *third* motive cause of similes, quite distinct from that of purely imaginative riot as also the self-absorbed sentiment or, under its other aspect, the dallying round important objects with the figurative power of the fancy, we have now to emphasize with particular reference to dramatic poetry. The content of the drama is made up of the conflict of passions, activities, pathos, actions, and the accomplishment of the thing willed by the soul, a content which does not, as in the case of the epic, take the form of a narrative of past events, but the dramatic poet places the individuals themselves before our eyes and makes them unfold their emotions personally in an objective form, and their actions as taking place in the present: his mediate position between ourselves and the objects represented therefore ceases. Looked at from this point of view it would appear as though in order to make this presence in Nature clear to us a primary requirement of drama would be that the expression of passions and the vehemence of their grief, consternation, and delight should be painted as naturally as it was possible to paint it, and consequently the simile would be here out of place. To let individuals, on the very plane of their action, in the full storm of emotion, and in the continuous strain of the busy world, speak much in the language of metaphor or image is obviously, from the commonsense point of view, an unnatural proceeding and injurious to the directness aimed at. We are by the simile diverted from the immediate

situation, and the characters, whose actions and emotions are involved in it, to something external and strange to it, which in short does not strictly belong to it, as part of its own present; consequently the general course of the dialogue must unavoidably appear to lag under the interruption thus imposed. And for this reason it came about also in Germany when at last our young bloods were all for freeing themselves from the fetters of French rhetorical taste, that the Spaniards, Italians, and French were regarded as artists who did nothing more than place their own personal flights of fancy or witticism, their own conventional attitude to society and elegance of speech in the mouth of their dramatic characters in situations, too, when the very tempest of emotion cried out for Nature's most direct expression to the exclusion of all other. We find as a result of such an insistence on the principle of realism that in many dramas, which hail from this time, the outcry of emotion, with all the exclamatory signs and hyphens which may render its nudity more visible, takes the place of a noble and dignified diction, rich in image and simile. In much the same sense even English critics have often charged Shakespeare with a superabundant and too varied recourse to the simile, some of which he not unfrequently will attach to characters in the full strain of personal bereavement, where the stress of emotion least of all admits of the tranquillity necessary to reflection, the attitude of mind which is indispensable to this type of comparison. We may no doubt admit that now and again we meet with in Shakespeare an exaggerated tendency to pile up image upon image, and that his diction is thereby overweighted. At the same time we shall see, if we examine the matter in all its bearings, that even in drama the simile is entitled to a position essential to this form of poetry and vital to its action.

In other words if the emotion makes a pause in similes for the reason that it is absorbed in its object and is unable to free itself therefrom, there is also on the plane of *active life* a distinct purpose subserved by it, namely, to

indicate that the individual is not thus so exclusively preoccupied with the particular situation or state of the emotions then uppermost, but possesses a fine and noble nature superior to such conditions and able to assert its independence. In passion soul-life is restricted and fettered to its own seclusion, narrowed down to the point of concentrated heat, either thereby a mute, an ejaculation of monosyllables, or the rage that vents itself at random. Greatness of soul and intellectual power alike refuse to submit to such limitations: they are wings which carry the soul in a fine tranquillity over and above the storm of pathos that moves it. It is this deliverance of the soul, which the simile primarily expresses by the very mode under which it is asserted. In other words it is only a really profound composure and strength which is able to make itself the object of its pain and suffering, to compare itself with something else, and by doing so to view itself impartially[108] in a strange material; or it may be in a mood of the most terrible scorn to set forth in the external thing the confronting image of its own annihilation, and still persist in the repose of its own obdurate forces. In epical poetry, as we before observed, it was the poet's undoubted function to transmit to his audience, by means of those halts by the way which his picturesque similitudes offered, that sense of tranquillity which is essential to fine art. In dramatic art, on the contrary, the *dramatis personae* appear as themselves the *poets* and *artists.* Here it is the characters who objectify their own soul-life in that which they are powerful enough to imagine and inform, thereby further manifesting to us the nobility of their receptive faculties and the inherent force of their emotional resources[109]. For this absorption into something else that is external is now[110] the deliverance of the world within from a purely practical interest, or at least is that which lifts the immediacy of emotion to the level of forms the soul may contemplate in freedom; and for this reason every comparison instituted simply for the comparison's sake in the way we have already observed it

under the first aspect of the simile discussed, is vindicated now in a much profounder sense than was then possible; it can now only appear as a victory over the exclusive obsession of passion and the release from its masterdom. In following up the course of this liberating process we will now emphasize several important distinctions to illustrate which we shall borrow exclusively from Shakespeare.

(*αα*) Now in the first place we would observe that when we have a soul set before us about to meet with a grave misfortune, by which it will be shaken to its depths, and the pain of this inevitable cataclysm is at length actually entered upon, it would be nothing less than an indication of a nature essentially commonplace if it were there and then to break out into the cry of horror, pain, and desperation, and so make a clean breast of it. A strong and noble spirit on the contrary holds its lamentation as such in reserve, keeps a hand of iron upon its pain, and by this means preserves a free power to embody in far-distant material imaginatively presented the profound sense of its anguish, and to express its own tragic state under the image of that which is remote. Thus man rises superior to his suffering; he is not utterly with all that is in him bondman to it; rather he is as wholly distinct from it as he is one with it; and consequently he can still pause before that which is outside and beyond him, which he relates to his emotion as an independent force cognate with his own. This will explain to us those words of the old Northumberland in Shakespeare's "Henry IV," when he inquires of the messenger who comes to inform him of the death of Percy, what news he brings him of his son and his brother, and, on receiving no reply, gives utterance to the composure of the most poignant grief as follows:

Thou tremblest; and the whiteness of thy cheek
Is apter than thy tongue to tell thy errand.
Even such a man, so faint, so spiritless,

So dull, so dead in look, so woe-begone,
Drew Priam's curtain in the dead of night,
And would have told him half his Troy was burnt;
But Priam found the fire ere he his tongue,
And I my Percy's death ere thou report'st it[111].

This attitude of the soul, which spins about itself as it were the garments of its pain, and yet retains the power throughout to image itself under new modes of comparison, receives a particularly striking illustration in the character of Richard II, where we find him repentant over the youthful frivolity of his days of prosperity. In fact there is no trait in this royal grief that is more touching or suggestive of a child's simplicity than the fact that he always expresses himself under the objective form of most pertinent images, and in the play of this type of self-expression preserves his suffering all the more profoundly. When, for example, Henry demands of him the crown, he replies:

Give me the crown. Here, cousin, seize the crown;
Here cousin;
On this side my hand, and on that side yours.
Now is this golden crown like a deep well
That owes two buckets, filling one another,
The emptier ever dancing in the air,
The other down, unseen and full of water.
That bucket down and full of tears am I,
Drinking my griefs while you mount up on high[112].

(*ββ*) The other aspect to which we would now draw attention is this, namely, that a character which is already made one with its interests, its

sorrow, and its destiny, endeavours by means of the simile to release itself from this immediate union, and makes this deliverance obvious to us by the very fact that it shows itself still able to deduce such similitudes. In "Henry VIII,"[113] for instance, the Queen Katherine, on being forsaken by her royal consort, expresses the depth of her desolation in the words:

I am the most unhappy woman living!
Alas, poor wenches, where are now your fortunes?
Shipwreck'd upon a kingdom, where no pity,
No friends, no hope; no kindred weep for me;
Almost no grave allow'd me: like the lily,
That once was mistress of the field and flourish'd,
I'll hang my head and perish.

In a still more admirable manner in "Julius Caesar"[114] Brutus exclaims to Cassius, to whose want of spirit he has vainly striven to give the spur:

O Cassius, you are yoked with a lamb
That carries anger as the flint bears fire;
Who, much enforced, shows a hasty spark,
And straight is cool again.

That Brutus in such a situation can find room for a simile is already an excellent proof that he himself has thrust his scorn into the background, and has begun to assert himself as master of it.

For the most part Shakespeare, by endowing his criminal characters with greatness of soul in crime no less than in misfortune, exalts them before he leaves them above their own evil passions: he will not let them rest in the purely abstract assertion of crimes they are for ever going to do, but never really commit, as is the French style, but actually infuses them with the imaginative power, by means of which they stand out before us as distinctly

as any other personification that is new to us. Macbeth, for instance, when his last hour has struck[115], exclaims in the well-known words:

Out, out, brief candle!
Life's but a walking shadow, a poor player
That struts and frets his hour upon the stage
And then is heard no more: it is a tale
Told by an idiot, full of sound and fury
Signifying nothing.

The same thing may be said of those last words of Cardinal Wolsey in "Henry VIII,"[116] uttered at the close of his career when struck down from the summit of his greatness:

Farewell! a long farewell to all my greatness!
This is the state of man: to-day he puts forth
The tender leaves of hopes: to-morrow blossoms,
And bears his blushing honours thick upon him;
The third day comes a frost, a killing frost;
And when he thinks, good easy man, full surely
His greatness is a-ripening, nips his root,
And then he falls, as I do.

(*γγ*) In this impersonal relation of objective fact and its expression of the comparative mode, the repose and substantial self-command of character returns to itself; it is the means whereby the pain of a great downfall is softened. So Cleopatra exclaims[117] to Charmian, after she has already put the mortal aspic to her breast:

Peace, peace!
Dost thou not see my baby at my breast,

That sucks the nurse asleep?
As sweet as balm, as soft as air, as gentle —

The bite of the serpent relaxes her members so gently that Death is himself deceived and holds himself to be Sleep. And this image may well pass as itself a counterfeit of the mild and allaying influence of such similitudes.

C. THE DISAPPEARANCE OF THE SYMBOLIC TYPE OF ART

Didactic, *descriptive poetry and the ancient epigram.*

The conception we have in general terms formed of the symbolic type of art is such that within it significance and expression are unable to unite sufficiently to appear in complete and reciprocal fusion. In unconscious symbolism the *incompatibility* of these two aspects remained a fact throughout, if not actually *declared* as such; in the Sublime on the contrary this inadequacy was *explicitly* asserted: the absolute significance, God, no less than His external reality, the world, are expressly represented in this excluding relation to one another. On the other hand, however, in all these types that further aspect of symbolism, namely, the *affinity* which obtains between the significance and the external form, in which it is visibly manifested, still retained its importance. In the original type of symbolism this was exclusively the case, a type which did not as yet set forth the significance in contrast to its concrete existence. But in the Sublime, too, it remained an *essential* relation, a type which, in order to express the Supreme Being, if here under a wholly inadequate mode, required as its means the phenomena of Nature, and the events and exploits of God's chosen people. And finally it reappears in the comparative type of art a personal relation and one that is consequently amenable to *caprice.* This element of caprice, however, albeit it is an entirely present fact and

particularly so in the case of the metaphor, image, and simile, is notwithstanding still hidden away behind the *affinity* between the significance and the image utilized to express it, in so far as it selects the comparison simply out of a regard for their mutual resemblance, a fundamental aspect of which is not so much the *external* form as just this *relation* set up between them by the activity of the soul and consisting in subjective emotions, points of view and ideas and their cognate modes of configuration[118]. When, however, it is not the notion of the material itself, but simply a capricious use of the judgment, which brings together the content and its artistic form, both can only be conceived as posited in an entirely external relation to one another; their association is now a juxtaposition without essential relation, simply a dressing up, that is to say, of the one side by the other. For this reason we have here to treat these last-mentioned and subordinate types of art by way of supplement. They arise from the absolute collapse of the essential phases in all true art-production; they bring before us, in short, by their independence of the principle of relativity the suicide of the symbolic type.

If we view this stage generally as a whole we find on the one hand already as wholly independent the elaborate but formless significance, for the artistic shaping of which all that we can now supply is an external ornament selected at caprice to set it off. On the other side we have the external mode pure and simple. That is to say, instead of being mediated in its identity with that on which it is imposed by the fact that this is its own essentially cognate significance it can now only be accepted and described in the aspect of its self-subsistence over against this *centrum* of significance, and consequently only as mere externality. From the above contrasted aspects we may differentiate in abstract terms *didactic* from *descriptive* poetry, a distinction which so far at least as the didactic is concerned is only to be made good under the poetic type for the reason that

this alone is able to bring before us the significance in its abstract universality.

Inasmuch, however, as the notion of art does not consist in the dissociation, but the identification of significance and form we find even at this stage not only a complete separation, but also in line with that, a relation asserted between the sides thus opposed. This relation, however, now that the partition line of symbolism has already been *crossed*, is no longer of a symbolic nature, and is therefore an attempt to abolish the fundamental characteristics of that type, namely, the incompatibility, and at the same time the self-subsistence of form and content, a position that all the previous types were unable to transcend. Owing, however, to the separation of the two sides, which thus make for unity, being already presupposed by this type this attempt can only be looked upon as a mere aspiration[119], to completely satisfy which in all that it involves is reserved for a more perfect type of art, namely, the classical.

We will now briefly glance at these supplementary forms, in order to make our passage from them to the real type above mentioned more fully intelligible.

1. THE DIDACTIC POEM

When a significance, which as such co-ordinates a homogeneous *complexus* of relations, is apprehended exclusively as significance, yet does not receive the form strictly adequate to this content, but is merely invested with the external ornamentation of art, then we have before us the didactic poem. The didactic poem does not figure among the genuine types of art. For in it we find on the one hand a content already completely elaborated under a mode that is thereby necessarily prosaic, while on the other we have the artistic form, which is merely tacked to it in an external way, for this very reason that it had already been accepted by the mind in a form stamped with *prose* throughout, and is merely exhibited to our common sense or

reflective faculties as instruction under this prosaic aspect, that is to say, with an exclusive reference to the significance embodied in its abstract and general terms. Consequently art, in this its external relation to a content so essentially foreign to its real informing process, can only recognize in the didactic poem its external aspects, such as metre, exalted language, episodic matter, images, similes, ebullitions of sentiment, points of acceleration and transition in the march of ideas, aspects in short which do not give us the heart of the content as such, but rather surround it as an incidental accretion, with the object of alleviating and making more enjoyable the serious and dry tone of the didactic material by means of their more inspiriting atmosphere. That which is intrinsically, in the fundamental conception of it, relegated to prose, cannot receive the poet's mintage, though it may be the peg on which he may hang his mantle[120]. Just as we find, for example, that the art of gardening is in great measure a purely external rearrangement of what is already presented us by Nature, but not necessarily of that which is itself a truly lovely locality; or as the art of building ameliorates by its ornament and external decoration a locality which has been expressly devoted to prosaic purposes and affairs.

In this way Greek Philosophy made a start under the mode of the didactic poem. We may even adduce Hesiod as an example, albeit a prosaic treatment of this kind in its strict sense is only fully assured when the understanding is undisputed master of the subject with its train of reflections, consequences, and classifications, and instructs us from this standpoint alone in as pleasing and elegant a way as it can. Lucretius, too, in his relations to the philosophy of Epicurus, and Vergil, with the information he supplies on agriculture, are in part examples of the same type. Despite all their artistic adroitness they are unable to give their versification the genuine spontaneity of the artistic form. In Germany the didactic poem is new out of fashion; in France Delille, in addition to his

previous efforts entitled “Les jardins, ou l’art d’embellir les paysages,” and his “Homme des champs,” has presented his compatriots with a further example of the didactic poem, in which he has treated physical science as compendiously through its forms of magnetism, electricity and the rest.

2. DESCRIPTIVE POETRY

The *second* type which we have to examine stands out in direct contrast to the previous one. The point of departure here is not from a significance already present before the mind in an independent form of its own, but from external objects simply such as natural localities, buildings, seasons of the year or periods of time, and the modes under which they are presented to sense. But as we found in the didactic poem the content persisted in formless *generality* so far as its essential character was concerned, so here, if in a converse manner, the *external material* is *independently* set forth in the singularity which pertains to it simply as phenomenon without being drawn within the circle of the significances apparent to mind; and it is this particularity which is depicted and described in its external aspect precisely as it appears to the matter-of-fact consciousness. Such a sensuous content has no relation to true art whatever, except under the *one* feature, namely, that of its external existence; and this can only claim art’s recognition in so far as it represents the natural basis of *spiritual* life and individuality, its actions and events, the facts, that is to say, which constitute an environing world; as merely external form separated by itself from all that pertains to such life it has no such claim.

3. RELATION OF BOTH ASPECTS

On grounds deducible from the above, neither the instructive nor the descriptive type is secured in the exclusive one-sidedness which would obliterate every vestige of art, and we find in the one case that the external reality is brought into appreciable relation with that which is seized by mind

as significance, just as conversely in the other the abstract universal is related to its concrete mode of appearance.

(*a*) We have already explained how this is so in the case of the didactic poem. Without depicting external conditions and particular phenomena, without the episodical narration of mythological and other illustrations we shall rarely find a genuine example of it. By means, however, of a parallel series of this character in which the universal for mind is thus laid alongside of the particular object of sense we have merely a quite collateral relation set up instead of a union carried out in every detail, a parallelogism, moreover, which does not affect the entire content and its all-embracing artistic form, but merely isolated aspects and traits.

(*b*) Such a modicum of true relation is particularly conspicuous in the case of descriptive poetry, in so far as its delineations are accompanied with such emotions as the sight of natural landscape, the course of the days and seasons, a wooded hill, a lake, a babbling brook, a church, a picturesquely situated village and the poor man's peaceful cottage are likely to arouse. We find consequently in descriptive poetry much as we do in the didactic poem episodes which, although merely accessory, animate us, in particular through the reflection of affecting emotions, such as a tender melancholy or little touches of occasional experience taken from the more homely levels of life. Such an association of spiritual feeling with the external facts of Nature can still only too easily in this type of poetry remain wholly external in its presentation. For the natural or local condition is here assumed to be something which quite independently confronts us. Man no doubt draws near to it; under its influence he entertains this or that feeling, but there is nothing which essentially unites moonlight, forests, valleys, landscape, and so on, with the emotions of the soul they excite. I am not here either the interpreter or the animating focus of Nature, but feel, as each happens to confront me, a wholly indefinite kind of harmonious reciprocity establish

itself between the objects I face and the emotional life which they stimulate. Most of all are we Germans devoted to this type of picturesque description, and along with it to every variety of exquisite feeling and heart effervescence such natural scenery can possibly evoke. It is a public high-road over which all may march in line. Even some of the odes of Klopstock are tuned to its key.

(*c*) But *thirdly*, if we inquire whether there is not a profounder relation between these opposed aspects of the internal feeling and external object, we shall find our nearest approach to an answer in the ancient *epigram.*

(*α*) The very name of the epigram already expresses the original gist of it. It is an *inscription.*

Unquestionably we find, also here on the one hand an object, and on the other we have a definite statement propounded as to this object; but in the most ancient epigrams, among which Hesiod has preserved a few examples, we do not have the picture of an object accompanied by any reaction of feeling, rather we find, the matter of fact put before us in two distinct ways. In the one the external existence, and with it the meaning thereof and explanation, is concentrated in its form as epigram on the keenest and most forcible of its characteristics. This original characterization of the epigram, however, even among the Greeks, later examples have already lost; and we find an increasing tendency both to secure and apply the passing conceits of fancy, whether ingenious, witty, or merely entertaining, to particular incidents, works of art, people and so on, ideas in short which do not so much set forth the object itself, as illustrate the condition of personal feeling in reference to the same.

(*β*) The main point to observe here is this that, just in proportion as the object itself fails as such to become the predominant factor in this type of presentment to that extent it becomes less complete. In this connection we

may also in passing mention a few more modern examples of an analogous nature. The novels of Tieck, for instance, not unfrequently have to deal with specific works of art or artists, or a definite gallery of pictures, composition of music and so forth, and they have then some nice little romance attached. These particular pictures, however, which the reader has never seen, these compositions, which he has never heard, the poet obviously can neither bring before our eyes nor ears. From this point of view the entire expression of his art, in so far as it depends on objects of this nature, must remain subject to this defect. In the same way in yet more important romances writers have sought to embody as the real content of their work entire arts, and their finest productions as Heinse, for instance, did with that of music in his *Hildegard von Hohenthal.* But in every case where we find that a work of art throughout is unable to reproduce with essential adequacy its fundamental subject-matter, we can only conclude that the primary cause of this defect arises from the inadequacy of the type of art selected.

(*γ*) To remove the defects above adverted to two things are clearly essential; the objective fact and the explanation of it which is offered to mind must not be suffered to fall into absolute *severation* as was the case in the type last considered, nor must the union when effected, an equally important point, assume a character *identical* with either the symbolical, sublime or purely comparative types. A yet more genuine form of presentment must be sought for under a condition in which we find that the fact in question supplies an elucidation of its ideal content by means of its external mode of appearance, and actually in this mode, a condition under which that which is of spirit unfolds itself completely in the form of its reality, and the corporeal and external presence is simply the adequate explication of the spiritual and ideal. In order, however, to follow up this problem to its complete *fulfilment* we must bid farewell to the symbolic types of art. For the essential character of symbolism consisted precisely in

this that the union of the animating principle of the significance with its spatial embodiment always *stopped short* of such completeness.

[76] In other words everything created being posited as unsubstantial apart from the One necessitated the conclusion that all the Goodness, etc., there divulged was referable to that Supreme Source.

[77] *Bewussten*, that is a symbolism conscious of its typical character. I have above used the expression "premeditated," but "conscious" is perhaps sufficient.

[78] I understand *auf solche Weise,* "under such a mode as expressed either by Symbolism or the Sublime."

[79] It is prosaic because it has no absolute root in reality.

[80] Lit., "As consciousness lays hold of the same in the clear light of ordinary reason" (*seiner verständigen Klarheit.*)

[81] *Theoretische*, that is personal, contemplative rather than practical.

[82] Lit., "and his freedom secludes itself with a prophetic instinct (*ahndend*) in itself."

[83] *Wie die Faust auf das Auge passt.* A proverbial expression unknown to me. We should rather say "a beam in our eyes."

[84] As contrasted, that is, with the fable.

[85] An Indian dancing girl.

[86] Hegel uses the term in the plural, *Die Verwandlungen*, possibly with reference to Ovid's Metamorphoses.

[87] *Standpunkt, i.e.*, the form viewed relatively to the general type.

[88] *Beseelung.*

[89] Plastic must be taken here in the very loose and pregnant sense of any art that deals with external material.

[90] *Ein grammatisches Subject.* Hegel presumably means that it is merely subject under the mode of literary expression without possessing the true determination of personality.

[91] *Aushöhlen muss.* We should rather say that the allegorist is forced to attenuate (lit. hollow out) the substance of subjectivity, etc. But I have left the more literal rendering.

[92] In the German *fassen*, *begreifen.*

[93] *Einer konkreten Anschauung.* That is, a quality or feature that belongs to the phenomena of the concrete world of perception.

[94] Of course this is not so in the English equivalent, where the primary sense is still material.

[95] Lit., "Of expressions in the strict sense of the term."

[96] *Ihr ruhiger vollständig ausgestaltender Sinn.* The meaning that declares itself completely through the form in classic repose.

[97] *Ausführliche*, explicit in all its detail.

[98] *Das Für-sich-seyn.*

[99] I give the literal translation. I presume a more intelligible one would be "but actual existence in its self-defined concreteness." The passage is not easy to follow.

[100]

Silent we pounded up carbon, saltpeter, and sulphur,
Set the train going. Good friend! How did our cracker find *you?*

Some as illuminate balls soared prodigious while others exploded,
Many we flashed in our fun simply the eye to delight.

[101] I find this analysis of the image more than usually difficult to follow, I have therefore made my translation very literal. I must confess that this distinction between the image and the metaphor appears to me rather an example of hyper-subtlety on Hegel's part, or as some might say, an effort to make what is virtually only a verbal distinction correspond to a more real difference of idea.

[102] That is the emphatically personal.

[103] *Die Schwelgerei.*

[104] In the German the sentence is continuous. Our version clearly gives another reading to the Hebrew.

[105] May be a misprint for "thy presence," *deine* instead of *die.*

[106] Chapman's translation.

[107] Chapman's translation, somewhat an extension of the Greek it must be admitted.

[108] *Theoretisch*, *i.e.*, in contemplative repose.

[109] Such I take to be the contrast implied in the words *den Adel ihrer Gesinnung* and *die Macht ihrers Gemüths. Gesinnung* is the sense-perception. *Gemüth* includes the creative fertility.

[110] *Hier*, *i.e.*, as contrasted with the first stage of the discussion.

[111] "Henry IV, Part II," act i, scene I.

[112] "King Richard II," act iv, sc. 1.

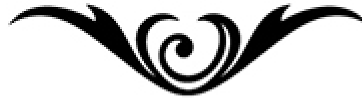
[113] "King Henry VIII," act iii, sc. 1.

[114] "Julius Caesar," act iv, sc. 3.

[115] "Macbeth," act v, sc. 5.

[116] "Henry VIII," act iii, sc. 2.

[117] "Antony and Cleopatra," act V, sc. 2.



[118] The meaning is that the selection is not made merely with reference to external resemblance, but is also based on relations only existing in the soul of the artist and therefore to that extent capricious, however much they appear to be essential.

[119] *Ein blosses Sollen,* lit., a mere "should," a mere movement in a given direction.

[120] This is implied in the contrast of the verbs *umstalten* and *überkleiden.*

SUBSECTION II

THE CLASSICAL TYPE OF ART

INTRODUCTION

THE CLASSIC TYPE IN GENERAL

Thr central point[121] of art's evolution is the union, in a self-integrated totality, carried to the point of its freest expression, of content and form wholly adequate thereto. This realization, coinciding as it does with the entire notional concept of the beautiful, towards which the symbolic form of art strove in vain, first becomes apparent in *classical art.* We have already, in our previous consideration of the Idea of the beautiful and of art, outlined the general character of classic art. The *Ideal* supplies a content and form to classical art, which in this adequate mode in which it is embodied reveals that which true art is according to its notion.

To perfect this result, however, all the various phases of art, whose evolution is the subject-matter of our previous investigations, are contributive. For classical beauty has for its ideal substance[122] free and *independent* significance, that is to say, not the significance of any particular thing, but a significance which *declares itself,* and thereby points to its substance. This is the *spiritual* substance, which in general terms is that which makes of itself an object. In this objectification *of itself* it possesses the form of externality, which, as identical with its ideal character, is consequently also on its own part the significance of itself, and is made conscious of itself by this self-knowledge. It is true that in our consideration of the symbolical our point of departure was that of the unity of the

significance and its mode of envisagement in the art product; but this unity was *purely immediate*, and for this reason inadequate.

For the real content either remained essentially the natural according to its *substance* and abstract *universality*, and consequently the *isolated* thing in the objective world of Nature[123], although it was regarded as the real determination of that universality, was not able to present the same in a mode adequate to it, or that which is purely ideal, and only to be apprehended by spirit, in so far as it was received in the artistic content, carried with it in that which was foreign to its essential nature, namely the immediate individual and sensuous thing, the mode of its appearance that was in fact incongruent with it. And generally here significance and form only stood in the relation of mere affinity and suggestion; and however much in certain respects they could be brought together homogeneously, they as clearly fell apart again in other directions. This original unity was therefore torn asunder; this simple and abstract inwardness or ideality was imaged for the Hindoo conception of the world on the one side in the manifold reality of Nature, and on the other in finite human existence; and the imagination, in the unrest of its impetuous motion, was carried from the one to the other by turns, without being either able to deliver the ideal in its essentially pure and absolute self-subsistency, or to thoroughly infuse it with the phenomenal matter as it was presented and informed, and so reproduce it throughout that material in undisturbed union. The disorder and grotesque appearance, which arose in the commingling of elements opposed to one another, no doubt again vanished, but only to make way for an enigmatical condition equally unsatisfying, which, instead of solving the problem, was only able to prevent the problem's solution. For here, too, still was lacking the freedom and self-subsistency of content, which only thereby is rendered explicit in that the Inward is presented to consciousness as in itself a whole, and by this means as that which overlaps the externality

which in the first instance is other than itself and foreign to itself. This essential self-subsistency, cognized as free and absolute significance, is self-consciousness, which has for its content the Absolute, and for its form the subjectivity of Spirit. In contradistinction to this self-determining, thinking, willing power everything else is self-subsistent in merely a relative and momentary sense. The material phenomena of Nature such as the sun, the heavens, stars, plants, animals, stones, streams and sea have only an abstract relation to themselves, and are in the eternal process of Nature bound up with other facts of natural existence, so that they can only pass as self-subsistent for the finite perception. The real significance of the Absolute is not presented in them. Nature is indeed under a mode expressed[124], but only under the mode of what is outside itself; its inwardness is not as such for itself, but poured forth into the varied show of its appearances, and consequently devoid of self subsistency. Only in Spirit as the concrete, free and, infinite self-relation, is the true and absolute significance actually disclosed, and self-subsistent under the mode of its determinate existence.

On the way to this emancipation of the Idea from the immediately sensuous medium and to its self-establishment we are confronted by the *Sublime* and the consecration of the imagination. The absolute significance is, that is to say, in the first instance the thinking, absolute and senseless[125] One, which is self-related as the Absolute, and in this relation affirms that which it creates; Nature and finitude generally, as the negative, thing, that which is essentially in itself devoid of stability. It is the explicit and essential Universal, conceived as the objective power over collective existence, whether it be that this One be brought now to consciousness and represented in its expressly negative attitude to the created, thing, or in its positively pantheistic inherence in the same. The twofold defect of this point of view, so far as it is connected with art, consists first in this that this

One and Universal which constitutes the fundamental significance has not yet in itself arrived at the closer determination and distinction, and by this means just as little at the point of real individuality and personality in which it could be apprehended as Spirit, and could be set before the sensuous perception in a form which would be applicable to its spiritual content, according to its own notion, and duly conformable therewith. The concrete idea of Spirit on the contrary requires, that it both defines and distinguishes itself in itself, and by the very act of making itself an object discovers through this reduplication an external phenomenon, which although material and present, nevertheless is throughout permeated by Spirit, and consequently taken by itself expresses nothing at all, simply permitting Spirit to declare itself as its inner core, the expression and reality of which it is. *Secondly*, from the point of view of the objective world the defect is bound up with this abstraction of an Absolute to which the principle of self-determination is lacking that now also the real phenomenon, being that which is essentially without substance, is unable to set forth under any true mode the Absolute in concrete shape. In contrast to those songs of praise and glory, those celebrations of the abstract and universal majesty of God, we have now in the passage we are making to a higher form of art to recall to our minds that phase of negativity, change, pain, and progress through life and death, which we discovered among other matter in the conceptions of the East. We have here set before us the principle of *self-distinction* in its essential character under a mode which is unable to unite with its conception the unity and self-subsistency of that subjective principle. Both aspects, however, both the essential and self-substantive unity, and the differentiation of that unity by virtue of a self-defined content, are equally necessary to unfold a true and free self-subsistency in its concrete and mediate totality.

In this connection we may incidentally, together with this reference to the Sublime, mention that further conception which at the same time entered on its process of explication in the East. It is that apprehension, in opposition to the substantiality of the one God, of internal freedom, self-subsistency and innate independence of the individual, so far as the elaboration of this impulse was permitted to Eastern nations. The main source of this attitude we must seek for among the Arabs, who in their deserts, upon the infinite sea of these expanses, with the clear heavens over their heads, in a nature such as this have emphasized their own courage and the bravery of their hand, as also the means of their self-preservation, whether it be camel, horse, lance, or sword. Here we find the more stubborn independence of personal character asserting itself in its contrast to the Hindoo softness and lack of individuality, as also to the more recent pantheism of Mohammedan poetry, and opposing also to the objective world its circumscribed, securely defined and immediate reality. With this incipient stage of the independence of the individual we must also associate free friendship, hospitality, and august nobility, but at the same time an insatiable lust of revenge and the inextinguishable memory of a hate, which is insistent and will have satisfaction with an unsparing passion and an absolutely remorseless cruelty. None the less all that happens on this soil is wholly within the circle of humanity. We have here deeds of revenge, conditions of love, traits of self-sacrificing nobility from which the fantastic and the wonderful have vanished; everything is carried forward in the secure and determinate shape which the causative connection of the facts necessitate. A similar conception of real objects which are referred to their determinate basis of actuality[126], and are made visible in their free power, not merely in that which conserves an exterior purpose[127], we discovered in an earlier stage of our investigations among the Hebrews. The more assured independence of character, the savagery of revenge and hate lie, too, at the

root of the original Jewish nationality. But the difference is at once pronounced, that in this case even the most powerful images of Nature are depicted less for their own sake than for that of the glory of God, as related to which they at once again lose their self-subsistency; and furthermore even hate and persecution are not merely a personal matter affecting persons, but are embraced in the service of God as national vengeance against whole peoples. As, for example, the later Psalms and yet more the prophets frequently only are able to desire and plead for the misfortune and overthrow of other nations, and not unfrequently find the main strength of their utterance in curses and imprecations.

No doubt the elements of true beauty and art are presented to each of these points of view above noticed; but they are in the first instance brought together in haphazard and confused fashion, and are set in a false relation to each other, instead of being referred to a genuine principle of identity. For this reason the purely ideal and abstract unity of the Divine is unable to bring forth any entirely adequate art-product in the form that is characterized by real individuality; and at the same time Nature and human individuality either are manifestly not, whether we consider their inward principle, or their external mode of appearance, permeated by the Absolute, or at least not positively pervaded by it. This *externality* of significance, which is thus made the essential content, and the determinate mode of appearance under which it is generally reproduced is finally and in the *third* place exemplified in the *comparative activity* of art[128]. In this type both sides have become wholly independent, and the unity that binds them together is merely the invisible subjectivity which compares. For this very reason that which is defective in such an external presentment returned in ever more emphatic degree and betrayed itself as that which was for the genuine art representation merely negative or, rather, entirely subversive. And when this dissolution is really effected the significance can no longer

remain the inherently *abstract* ideal, but the inherently determinate and self-defined ideal principle, which in this its concrete totality possesses quite as essentially the other aspect thereof, that is, the form of an inherently exclusive and determinate appearance; and consequently in its external existence, as that which is its very own, merely expresses and signifies itself.

1. This essentially free totality which remains constant to itself throughout each successive self-determination in something other than itself, this ideal principle, which in its objectivity is self-related is the essentially true, free, and self-subsistent, which in its determinate existence unfolds nothing other than itself. In the realm of art, however, this form is not present in its form of infinitude, is not, that is, the *thinking* of itself, as the essential, absolute, which is made an object for itself in the form of ideal universality, and makes itself, wholly explicit, but is still in immediate natural and sensuous existence. In so far, however, as significance is self-substantive, it must in art borrow its form from its own resources and inherently possess the principle of its externality. It must consequently, it is true, repair to Nature, but as predominant over that which is external, which, in so far as it is itself an aspect of the totality of this ideal realm, no longer exists as purely natural objectivity, but being without its own self-subsistence, simply serves as the expression of Spirit. In this interpenetration consequently the natural form and externality, which is modified by Spirit contains out and out on its part, as immediately given, its significance in itself, and no longer points to this as to something separate and different from the corporeal appearance. And this is that identification of the spiritual and natural which is appropriate to the notion of Spirit, which, that is, does not merely proceed no further than the neutralization of the two opposed aspects, but raises that which is spiritual into the higher

totality, in which it is able to preserve itself in its own Other, to bring the natural within its own ideal range and to express itself in and relatively to the natural. It is on this type of unity that the notion of classical art is based.

(*a*) This identity of significance and bodily form may be approached yet more closely under the view of it that no separation of these opposed aspects[129] takes place within their consummated union; and consequently the ideal principle does not, as *purely inward spirituality*, return upon itself from out of the corporeal and concrete reality, under a process which would give us once more the distinction of these aspects in opposition. And inasmuch as the objective and external, in which Spirit is made visible as an object of sense, according to the very notion of it, is at once throughout *defined* and *separate*, mind which is free, and which it is the function of art to elaborate in the form of reality truly commensurate with it, can only be that spiritual individuality which is not merely *defined* but essentially *self-consistent* in its natural form. For this reason it is the *human* which constitutes the centre and content of true beauty and art; but as content of art — we have already developed the subject in discussing the notion of the Ideal — it is brought under the essential determination of concrete individuality and the external appearance adequate thereto, which in its objectivization has been thus purified from the imperfection of the finite condition.

(*b*) Under such a consideration of the matter it is at once obvious that the classical mode of representation, if we take it for what it *essentially* is, can no longer be of the *symbolic* type in the strict sense of the term, however much now and again we may find along with it the play of that which belongs to symbolism. Greek mythology, for example, which, in so far as art asserts its mastery over it, belongs to the classical Ideal, is, if we grasp it in its fundamental character, not of a beauty which is symbolical, but

unfolded under the genuine character of the Art-ideal, albeit there may be certain remnants of symbolism which adhere to it, as we shall shortly see.

If we now proceed to ask ourselves what, then, is the nature of the determinate form, which can thus enter into this unity with Spirit without offering merely the suggestion of its content, we shall find it determined for us in the conception that in classical art both content and form must be adequate, must, that is, in the aspect of form meet the demands of totality and essential self-subsistency. For it is a prime condition of the free self-subsistence[130] of the whole, which constitutes the fundamental determination of classical art, that either of these aspects, the ideal form no less than its external embodiment, should be essentially a totality which goes to make the notion of the whole. Only by this means is either side *essentially* identical with the other, and consequently their difference reduced to the purely formal differences of one and the same, through which also the totality appears now as free, the adequacy of both of its aspects being now fully displayed, inasmuch as it declares itself in either of them and is one and the same in both.

The lack of this free reduplication of itself within the same unity carried with it in the symbolic type precisely this absence of freedom in the content and with it also in the form. Spirit was here not clear to itself, and for this reason declared its external reality not as that which belonged to itself, set forth in its explicit significance through and in it. Conversely the form had no doubt to be significant, but its significance only lay partly and on one side in it. The external existence gave here primarily to what passed for its ideal aspect, though still under a mode that was external, merely *itself* instead of a significance which declared an ideal content; and in attempting to show that there was something further which it suggested its power was necessarily put under a constraint. In this distortion it neither remained true to itself, nor was it the Other, that is significance, but declared nothing save

that which was a problematical connection and confusion between incompatible things, or tended to be the purely co-adjutant attire and external adornment of what was simply the glorification of the one absolute significance of all things whatever, until it was finally obliged to surrender itself to the purely subjective caprice of comparison with a significance which was far removed from it and indifferent to it. If this relation of unfreedom is to find a release the form must already inherently possess its significance, or, to speak more definitely, must possess the significance of mind or Spirit itself. This form is essentially the *human* form because the externality of this form is alone capable of revealing the spiritual in sensuous guise. Human expression in countenance, eye, pose, and carriage is, it is true, material and therein not that which the spirit is; but within this corporeal frame itself the human exterior is not merely alive and a part of Nature as the animal is, but it is the bodily presence which reflects Spirit to itself. Through the human eye we look into the soul of a man just as through the entire presentment of him his spiritual character is expressed. When consequently the body belongs to Spirit, as *its* determinate presence, Spirit is also that ideal principle which is appropriate to the body, and is no form of ideality which is foreign to the external form in the sense that materiality still inherently possesses a significance other than that to which it testifies or suggests. It is quite true that the human form still carries within it much of the universal animal type, but the fundamental distinction between the human and the animal body consists simply in this, that the human is obviously, by virtue of its entire conformation, declared as the dwelling, nay, we may add the only possible dwelling-place of Spirit. And for this reason also it is only in the body that Spirit is immediately present to others. This is, however, not the place to discuss the necessity[131] of this association and the peculiar reciprocity of soul and body. We must here assume this necessity. We have, of course, many indications on the human figure of

death and ugliness, that is, of other influences and defects which are traceable to their source. When we find this to be the case it is the function of art to expunge the divergence between the purely natural and the spiritual, to exalt the external bodily appearance to a form of beauty, that is, a form throughout dominated and suffused with the animation of Spirit.

We have seen, then, that in this type of representation symbolism is no longer presented by the external relation, and everything that partook of effort, strain, distortion, and perversion is eliminated. For when Spirit has grasped itself as Spirit it is at once explicit and clear; and on the same ground is also its association with the form adequate to it from the side of externality, something which is essentially ready to the hand and a free gift, which does not require, as a means for its declaration, a bond of connection introduced by the imagination, and contrasting with that which is immediately presented. Just as little is the classical form of art exhibited as a purely material and superficial personification. It is Spirit in its entirety, in so far as it is intended to make it the content of the art-product, which passes into that bodily shape, and is able to identify itself completely with it. From this point of view we may considerer the conception that art has followed the human figure by means of imitation. According to the common view, however, this acceptance of the human figure as the model of imitation appears as a matter of accident, whereas we should rather maintain the art which has arrived at its maturity is obliged to reveal its substance by a necessary law in the form of man as he appears to sense perception, because Spirit alone obtains in it the existence fitting to it in the sensuous material of Nature.

All that we have here observed relatively to the human body and its expression applies also to human emotions, impulses, actions, experiences, and occupations. The externalization of these is also, in classical art, not merely characterized as a part of Nature's life, but as that of Spirit; and this

ideal aspect is brought into full and adequate identity with that which is external appearance.

(*c*) Inasmuch, then, as classical art comprehends free spirituality as determinate individuality, and immediately envisages the same in its bodily presentment, it frequently falls under the reproach of anthropomorphism. Even among the Greeks, to take an example, Xenophanes ridiculed the presentation of Gods by means of the sensuous image in his famous remark, that if lions had been sculptors they would have given their gods the external shape of lions. Of a similar tendency is that piece of French wit: God made men according to His image, but man has returned Him the compliment by creating God in the image of man. If we consider the matter relatively to the form of art that follows, the romantic, we may in this respect observe that the content of the classical form of beauty is no doubt defective precisely as the religion of art is so; but so little does the defect consist in anthropomorphism as such, that we may rather maintain, on the contrary, that though classical art is certainly sufficiently anthropomorphic for art, for the higher form of religion it is not enough so. Christianity has carried anthropomorphism to far greater lengths; for, according to Christian doctrine, God is not merely individuality in a human form, but a real and singular individual entirely God, and entirely a real man who has entered into all conditions of existence, and is no mere Ideal of beauty and art created by man. If our conception of the Absolute is limited to an abstract Being essentially without any characterization then, no doubt, every kind of representation vanishes, but if God is Spirit he must appear as man, as individual subject, not as ideal human being, but as actual participator in the entire externality of temporal conditions[132] which pertain to immediate and natural existence. In other words, from the Christian point of view, the infinite movement is carried to the extremest verge of opposition, and only returns to the absolute unity as the resolution of this separation. The man-

becoming of God is incident to this phase or significant moment of separation; as real and individual subjectivity it is involved in the difference between unity and substance in its bare extension, and in this common sphere of temporal and spatial condition creates the consciousness in and pain of division in order through the ultimate resolution of such contradiction by the same means to arrive at eternal reconciliation. And this essential point of passage in the process, according to the Christian conception, is inherent in the nature of God Himself. As a matter of fact, God is here apprehended as absolute and free Spirit, in which Nature and immediate singularity is indeed proferred us as a phasal moment of a process, but, at the same time, as one which is necessarily transcended[133]. In classical art, on the contrary, the material medium is neither killed nor suffers death, but for this reason also we cannot wholly find in it the resurrection of Spirit. Classical art and its religion of beauty does not consequently wholly satisfy the depths of Spirit. However essentially concrete it may be, it still remains abstract for humanity because, instead of movement and reconciliation obtained by the contradiction we have adverted to of that infinite subjective process, it merely possesses as its life that undisturbed harmony of the free individuality determined in its adequate existence, this repose in its reality, this happiness, this content and greatness in itself, this eternal blitheness and bliss which even in unhappiness and pain does not lose its secure reliance on itself. Classical art has not worked its way to the full contradiction which is fundamentally involved in the notion of the Absolute and overcome that contradiction. For this reason it does not recognize the aspect which is in close relation to this contradiction, that is the essential obduracy of the subject as opposed to that which is ethical and of absolute significance, namely, sin and evil, no less than the waste of individual life in its own subjective aims, the dissolution and incontinence of that world which we may summarily describe as that of

the entire sphere of its divisions, which is productive on the side both of sense and spirit of distortion, ugliness, and the repulsive. Classical art fails to cross the pure territory of the genuine Ideal.

2. In so far as the *historical* realization of classical art is concerned, it is hardly necessary to observe that we must seek for that among the Greeks. Classical beauty, with its infinite range of content, material and form, is the gift bestowed on the Greek people; and this folk is entitled to our respect on the ground that it has produced art in its highest form of vitality. The Greeks, if we regard the form of their realized life immediately presented us, lived in that happy middle sphere of self-conscious and subjective freedom and substantive ethical life. They did not persist, on the one hand, in the unfree Oriental unity, which is necessarily bound up with a religious and political despotism for the reason that the individuality of the subject is overwhelmed in a universal substance, or, in some particular aspect of the same, because it has essentially as personality no right, and consequently no ground to stand on; neither, on the other, did they pass beyond to that subjective penetration, in which the particular subject separates itself from the whole and the universal, in order to make itself more explicit in its ideality; and only through a higher return to the ideal totality of a purely spiritual world, succeeds in its final purification of the substantive and essential. On the contrary, in the ethical life of Greece, the individual was self-substantive and essentially free, without disengaging himself from the general interests of the realized State immediately visible to him and the positive immanence of spiritual freedom in the temporal condition. The universal of morality and the abstract freedom of personality, both in its ideal and external aspect, remains in accordance with the principle of Greek life in undisturbed harmony, and during the time in which, even in real existence, this principle asserted itself in still unimpaired purity, the self-substantiality of the citizen did not stand forth in relief in contrast to a

morality which was to be distinguished from it: the substance of political life was so far merged in the individual, as he on his part sought his own liberty absolutely in the universal ends of the entire civic life. The feeling for beauty, the significance and spirit of this joyous harmony interpenetrates all productions, in which the freedom of Greece is self-conscious, and in which she has made visible to herself her being. Consequently her view of the world is just the midway ground on which beauty commences its true life and breaks open its serene dominion; the intermediate realm, that is, of free vitality, which is not merely a fact at once immediate and natural, but one which is the creation of a spiritual point of view revealed by art, the realm, that is, of a culture of reflection, and at the same time of an absence of reflection, which neither isolates the individual nor on the other hand is competent to bring back again its negativity, pain, and unhappiness to a positive unity and reconciliation — a realm, however, which, just as in the case of Life itself, is at the same time only a point of passage, however true it be that it scales at this point the summit of beauty, and in the form of its plastic individuality is so spiritually concrete and rich, that all tones have their interplay within it, and also, too, that which is for its own standpoint what lies behind it, albeit it is no longer present as an absolute and unqualified principle, is nevertheless felt as that which accompanies it — a kind of background to it. In this sense the Greek nation has also, in the representation of its gods, made its spirit visible to the perceptions and the imaginative consciousness, and bestowed on them, by means of art a determinate existence, which is entirely conformable with their true content. By virtue of this homogeneous form, which is alike consistent with the fundamental notion of Greek art and Greek mythology, art became in Greece the highest expression for the Absolute, and Greek religion is the religion of art itself, whereas romantic art, which appeared later, although it

is undoubtedly art, suggests a more exalted form of consciousness than art is in a position to supply.

3. In establishing the position, as we have just done, on the one hand, that essentially free individuality is the content of classical art, and, on the other, that a like freedom is the equally requisite determinant of the form, we have already assumed that the entire blending of both together, however much it may be presented in the immediate form, is nevertheless no original unity such as Nature's, but is necessarily an *artificial* association made possible by the subjective spirit. Classical art, in so far as its content and its form is spontaneity[134], originates in the freedom of the Spirit that is clear to itself. And for this reason also we may say that in the *third* place the artist occupies a position different from that of his predecessors. That is to say his production declares itself as the spontaneous *product* of a man in the full possession of his senses[135], who as truly *knows* what he wills as he is *able* to accomplish such a purpose; who is consequently obscure to himself neither in respect to the significance and substantive content of that which he has resolved to make visible in the form of art, nor finds himself hindered by any defects of technique from executing the result aimed after.

(*a*) If we look more closely at this change in the position of the artist we shall in the first place find this freedom announced to us relatively to the *content* in this way, that he does not feel compelled to seek for it with the restless process of symbolical fermentation. Symbolic art remains the captive of its travail to bring to birth and make clear its form to its own vision, and this embodiment is itself only the original form[136], that is, on the one side Being in the immediate guise of Nature, and on the other the ideal abstraction of the universal, unity, conversion, change, becoming, origination, and passing away. In this original form of the artistic process, however, art does not come to its rightful possessions. Consequently, these representations of symbolic art, which should be expositions of content,

remain still themselves riddles and problems, and merely testify to the struggle after clarity and the effort of Spirit, which on and on seeks to discover without obtaining the rest and repose of discovery. In contrast to this troublous search the content must for the classic artist be presented him as something *already there* in the sense that as a thing essentially positive, as belief, popular opinion, or as an actual event either of myth or tradition, it is determined for his imagination in all its essential character. Relatively to this objectively determined material the artist is placed in the freer relation that he does not himself undertake the process of production and fermentation, and pass no further than the impulse after the real significances of his art, but rather that for him a completely explicit and unfolded content lies before him which he accepts and freely reproduces from himself. The Greek artists received their material from the popular religion in which already that which had been brought over to Greece from the Orient had begun to receive a form of its own. Pheidias borrowed his Zeus from Homer, and other tragedians also did not create the fundamental groundwork of that they represented. In the same way the artists of Christianity, Dante and Raphael, have only reclothed what was already to hand in the doctrines of their faith and their religious conceptions. This is also, it is true, from a certain point of view in like manner the case in the art of the Sublime, but with this difference, that here the relation to the content, as the *one* substance, does not permit subjectivity to come by its just claims, and allows to it no self-substantive finality. The comparative form of art, on the other hand, no doubt starts with the selection of significances as images which it makes use of, but this initiative of selection remains at the disposition of *subjective* caprice, and on its part dispenses with all substantive individuality, which constitutes the notion of classical art, and for this reason must rest with the personality which creates it.

(*b*) The more, however, an explicitly unfolded content is present for the artist in popular beliefs, myth, and other actual facts, the more his energy is concentrated upon the object of endowing such a content with the *external embodiment* of art fitting to it. While in this respect symbolic art dissipates its resources in a thousand forms, and with unbridled imaginative power lays about it for material that it fails either to measure or define in order to adapt forms that are never really conformable to the significance it is seeking after, the classical artist in this respect is possessed of an aim that is at once resolute and definite. That is to say, the free form is with the content itself defined through that content, and is essentially pertinent to such content, so that the artist only appears to execute what is already accordant with the fundamental conception of what is presented him. While, therefore, the symbolic artist strives in his imagination, to suit the form to significance or *vice versa*, the classic artist *adapts* significance to plastic shape by means of the process of freeing the external phenomena which are already presented from that part of them which is merely an incidental product. In this activity, however, although all that is purely his caprice is excluded, his productive power not merely follows or is not merely limited to a bare type, but is at the same time *creative* throughout the whole. Art which, to start with, is forced to seek out and discover its true form neglects for that reason the very aspect of form; but where, on the contrary, the building up of form is made the essential interest and the main task there we find the content also receives its plastic shape by imperceptible degrees through the process of the reproduction, precisely as we have hitherto found in a general way that form and content proceed hand in hand during the process, wherein they are completed. In this respect the classic artist elaborates the result also where it is a religious world that is presented him; he throughout develops in the free and buoyant medium of his art the material and mythological ideas which he receives.

(*c*) The same applies to the technique of art. In the case of the classic artist the ingredients must be already to hand; the sensuous material through which the artist labours must already be disengaged from all brittleness and extreme stubbornness, and yield directly to the aims of the artist, in order that the content, conformably to the notion of the classic type, may make its free and unfettered way through this external medium. To classical art, consequently, belongs from the first a high level of technical ability, which has subjected the sensuous material to an apt subservience. Such a technical perfection, if it is really to carry out all that is required of Spirit and its conceptions, is presupposed by the complete elaboration of all that pertains to craftsmanship in art, that is, in especial degree of that which makes itself visible within the plastic forms of the religion to which we now refer. The religious view of things, such as the Egyptian, for example, discovers, that is, definite external forms, idols, colossal constructions whose type remains fixed, and, further, in the usual similarity of forms and shapes, supplies a considerable field for elaboration in the treatment of it by the steadily progressive executive powers. This adaptability to the talents of the craftsman must already have been presented in that which is of an inferior and distorted type before the genius of classical beauty can associate these powers of mechanical facility with the forms of technical perfection. Then, at last, when that which is purely mechanical work is confronted with no further insuperable difficulty, is art enabled to proceed in the elaboration of a form, the practice in working out which is at the same time an elaboration which is in the closest relationship to the progressive advance of both content and form.

So far as the *division* of classical art is concerned it is usual in the more general sense of the term to call every complete work of art classic, whatever the particular character it may otherwise carry, whether symbolic or romantic. We have no doubt thus accepted it in the particular sense of art

perfection, but with this important qualification, that this perfection must be based on the thorough interpenetration of ideal and free individuality and external definition. We consequently differentiate the classic form expressly from the symbolic and romantic, whose beauty in content and form is entirely of another kind. And along with the classic, regarded in its usual and more indefinite significance, we have as little to do here at this early stage with the particular arts in which the classical ideal is represented, as, for example, sculpture, the Epic, definite forms of lyrical poetry and specific types of tragedy and comedy. These particular types of art, although classic art is imprinted upon them, will be first discussed in the third portion of the division of our subject in the explication of the several arts and their grades[137]. What we approach more immediately now is the classic in the sense we have secured for the term, and as bases of our subdivision we can only therefore seek out the grades of evolution, which proceed from this notion of the classical ideal itself. The essential phases of this development are as follows.

The *first* point to which we would direct our attention is this, that the classical type of art is not to be apprehended as was the case with the symbolic type as immediately primary, as art's *commencement*, but, on the contrary, as its *result.* We have evolved it, consequently, in the first instance from the course of the symbolic modes of representation, which it presupposes. The essential feature on which this process turned was the concentration of content in the elucidation of an essentially self-conscious individuality, which can neither employ for its expression the mere natural form, whether it be that of the elements or animals, nor the defective and confused personification of the human figure with it, but receives its expression in the animation of the human body permeated throughout with the breath of Spirit. Inasmuch, then, as the essence of freedom consists in this, to be that which it is through its own resources, that which in the first

place appeared purely as the presupposition and condition of its origin outside the sphere of classical art must take its place within the circle peculiar to the same in order to make really visible the true content and the genuine form by means of the subjection of what is unconformable to and the negation of the Ideal. This process of conformation through negation, this process by means of which, whether we view it relatively to content or form, the genuine type of classical beauty begets itself from its own substance is consequently our point of departure, and we shall treat of that in our *first* chapter.

In the *second* chapter, on the other hand, we have reached by means of this process the true Ideal of the classical type of art. We find here as the central fact the fair and novel world of the gods of Greece, which it will be incumbent on us to develop exhaustively from within, both in its aspects of spiritual individualization, and those which are related to the bodily form with which such individuality is immediately associated.

In the *third* place, however, the notion of classical art implies conversely, along with this becoming of the beauty which springs from itself, also the dissolution of that creation, which will carry us into a further sphere, namely, that of the romantic type of art. The gods and human individuals of classic beauty just as they rise so, too, pass away once more from the art-consciousness, which in part turns round in opposition to the aspect of Nature that still persists, in which Greek art, in fact, had elaborated itself in the full perfection of beauty, in part transcends an undeific[138], defective, and vulgar mode of reality in order to reveal that which is false and purely negative therein. In this dissolution, whose artistic activity we shall take as the material of our third chapter, the specific phases in the process, which created the truly classical type in that harmony presented by the perfect fusion of immediate beauty, fall apart. The ideal essence is made explicit on the one side in its independence of the external mode of its existence on the

other. Subjectivity withdraws into itself, for the reason that it fails now to find an adequate realization in the forms hitherto employed, and is constrained to enlarge itself with the fuller content of a new spiritual world of absolute freedom and infinity, looking about for novel means of expressing this profounder grasp of its substance.

[121] The central point, that is, in the entire evolution of the types of art, classical art being intermediate between symbolic and romantic art and in a certain sense marking a point of culmination.

[122] *Zu ihrem Inneren*, *i. e.*, that which unites it as a whole rather than is the purely external form. The Inward of man is the notion of man, not the mere fact that he has a head and arms, etc.

[123] The "Nature-existence," as Hegel calls it.

[124] *Die Natur ist freilich heraus.* Nature is there explicitly before us, but not all that is implied in Nature is made explicit in the material world.

[125] *Sinnlichkeitslos*, "senseless" as devoid of or abstracted from all sense.

[126] *Auf ihr festes Maas zurückgeführt.* To their own proper standard or measure that strictly applies to them.

[127] I think this must be the meaning of *nützlich* here. But the passage is not an easy one.

[128] That is, the comparative type of art discussed at the conclusion of the preceding section.

[129] That is, the Inward or ideal principle and the natural externality.

[130] *Selbstständigkeit.* Self-consistency or independence are perhaps better words here.

[131] That is, I suppose, the causal necessity as part of natural evolution.

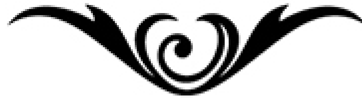
[132] *Bis zur zeitlichen gänzlichen Äußerlichkeit.*

[133] These words contain no doubt the epitome of Hegel's "Philosophy of Religion" and are involved in its difficulties. The reference to the historical facts of Christianity under ideal conceptions is obvious. I have translated

the words *das Moment des Natürlichen ... zwar vorhanden seyn* as a phasal moment of “a process,” but I am well aware that no mere amplification of this sort can in itself make the words clear.

[134] *Das Freie.*

[135] *Des besonnenen Menschen*, *i.e.*, the man of clear intelligence, sound sense, as we say.



[136] The words *dieser Gehalt ist selber nur der Erste* would seem to refer back to the expressions *Keine Erste und somit natürliche Einheit.* But the sense is not very clear.

[137] *Deren Gattungen,* their specific types.

[138] *Entgöttert* — a mode from which the Divine is removed.

CHAPTER I

THE COMING INTO BEING OF THE CLASSIC IDEAL

In the notion of free Spirit is contained immediately that aspect of the process of intelligence we may describe as self-introspection, return upon the self, of being explicit as an object existing for the self and in a determinate place, although this penetration into the realm of subjectivity, as we have already observed, does not either necessarily proceed to the length of making the subject essentially self-substantive in its negative aspect as against all that is concrete in Spirit and presented us as the stability of Nature, nor to that absolute reconciliation which constitutes, the freedom of the infinite subjectivity in truth. With the freedom of Spirit, however, in whatever form it may appear, is generally associated the elimination of that which is purely natural, regarded as that which is the Other in contrast to Spirit. Spirit must in the first instance essentially withdraw itself from Nature, uplift itself over, her boundaries and overcome them, ere it can prevail with unfettered movement within those bounds as within an element that is opposed to it, and can build itself up in a positive mode of existence truly indicative of its own freedom. If we further ask for a closer definition of the object through the transcendence of which Spirit attains to its self-substantive form in classical art we shall find this object is not Nature merely as such, but rather a Nature that is already throughout suffused with the significations of Spirit, in other words the symbolic type of art, which made use of the immediately natural form as a means of expressing the Absolute, its artistic consciousness either seeing in animals and so forth the presence of gods, or striving vainly under false modes

toward the true unity of the spiritual and the natural. It is through the removal and reformation of this defective association that the Ideal for the first time presents itself as the Ideal, and is forced to develop consequently this process of transcendence within its own sphere as a phase of its own necessary evolution. Such a consideration at once enables us to dispose of the question whether the Greeks received this religion from extraneous sources or no. We have already seen that subordinate conceptions are necessarily presupposed in the very notion of classical art. These, in so far as they in truth appear and are presented as factors of human history, are, as opposed to the higher form, which strives to pass beyond them, the actual starting-point of the new self-evolving art. And this is so, though in the particular case of Greek mythology there is not throughout historical evidence for these preliminary data. The relation, however, of the Greek spirit to these presupposed data is essentially a relation of construction and in the first instance of transformation. If this were not so the conceptions and forms of the same had remained as they were. It is true that Herodotus says, in a passage already cited, of Homer and Hesiod, that they had created their gods for the Greeks, but he also speaks expressly of particular gods, how this or that one was Egyptian or some other form: the poetic activity does not therefore exclude the reception of material from other sources, but merely suggests an essential transformation. For the Greeks possessed mythological conceptions before the time in which Herodotus places those original poets.

If we inquire further into the more obvious aspects of this necessary transformation of that which is undoubtedly involved with, but at first still alien from, the Ideal, we find it set before us in naïve form as content of mythology itself. The main fact of Greek theology is this, that it creates itself and constitutes itself from that which has gone before, which takes its place in the origins and process of its own generic history. Incidental to this

origination, in so far as the gods are taken to be spiritual individualities in determinate bodily shape, we find, on the one hand, that Spirit, instead of giving visibility to its essence in that which is purely vital and animal, regards life rather as an attribute which is insufficient[139], as its unhappiness and death, and, on the other, that it is in the living thing that it triumphs over the elements of Nature and its confused reproduction. Conversely, however, it is equally necessary for the Ideal of the classic gods, not merely to stand over against Nature and its elemental powers as individual spirit in its finite and abstract seclusion, but to possess itself the elements of the universal natural life notionally as a phasal moment in the vital constitution of Spirit. As the essence of the gods is essentially *universal*, and in this very universality they are defined as individuals, it follows also that the aspect of their bodily presence must essentially include at the same time the natural as the essential and wide-reaching power of Nature, and as vital activity intertwined with spirituality itself.

In this respect we may differentiate the process of embodiment followed by the classical art-form under the following points of view.

The *first* concerns the degradation of that which is purely animal, and the removal of the same from the sphere of free and pure Beauty.

The *second* more important aspect is related to the elemental itself, in the first instance conceived as gods put before us as powers of Nature, through whose conquest alone the genuine race of gods can attain to undisputed mastery, that is in the war between the ancient and new gods. But this negative tendency becomes, then, in the *third* place, after Spirit has secured its free right, to the same extent once again an affirmative force, and elemental Nature constitutes an aspect of godhead permeated with individualized spirituality in order to re-establish even the animal organism, though here only of an attributive and external sign. Following the above

points of view we will now, if still at no great length, endeavour to emphasize the more definite traits, which here come under consideration.

1. THE DEGRADATION OF ANIMALISM[140]

Among the Indians and Egyptians, among Asiatics generally we find animalism, or at any rate specific kinds of animals regarded as sacred and worshipped, because in them the Divine itself is taken to be visible to sense. The animal form is consequently also a main feature of their artistic representations, albeit they are in addition merely used as symbolic and in association with human forms, in the stage previous to that where we find the human, and only the human, apprehended by consciousness as that which is alone true. It is only in virtue of the self-consciousness of the spiritual that the respect for the obscure and gloomy ideality of animal life disappears. This has already taken place among the ancient Hebrews who regard, as we have already observed, the whole of Nature neither as symbol nor as the presence of God, and attach to external objects merely the powers and vitality which in fact dwell within them. At the same time there still remains even among them, if in accidental fashion, at least a vestige of reverence for the living thing as such. We may illustrate this with the fact that Moses forbids the use of animal blood as food for the reason that life is centred in the blood. Man, however, is really under a necessity to eat that which is his natural food. The next step which we must draw attention to in this passage to classical art consists in lowering the high worth and position of what is animal, and making this degradation itself the content of religious conceptions and artistic productions. And illustrative of this we find abundant examples from which I shall merely offer the following selections.

(*a*) We find that among the Greeks certain animals appear conspicuous among others, as the snake, for example, is presented us in the sacrifices of Homer as an exceptionally beloved genius[141], and before all others it is this

species which is offered to one god, while others are appropriated to some other. We find, further that the hare, which runs across the way, birds observed in their flight to right hand or left, and entrails are investigated as fruitful in prophetic significance. All this, it is true, indicates a real reverence for the animal type, since the gods communicate through them and speak to men by means of omens. If we look at the heart of the matter, however, we shall find these to be merely isolated revelations, suggestive of superstition no doubt, but merely momentary hints of the Divine. On the other hand, it is an important fact that animals are sacrificed and the sacrificial flesh eaten. Among the Indians sacred animals are on the contrary preserved alive as such, and taken care of, and among the Egyptians they are even preserved after their death. For the Greek it is the sacrifice which is sacred. In the sacrifice man demonstrates that he is willing to give up a consecrated thing to his gods, and to deprive himself wholly of the use of the same. And in this connection we may observe a characteristic trait in the Greek rite, among which people the sacrifice was observed as at the same time a hospitable feast[142], only a part of the same being dedicate to the gods, that is, the portion which it was assumed they alone could enjoy, while the Greek himself retained and feasted upon the flesh. Out of this circumstance originated a mythical tale in Greece. The ancient Greeks, it is said, sacrificed with the greatest solemnity to the gods, and suffered the entirety of the sacrificial animal to be consumed in the flames. Not even the poorer suppliants dared contest this great waste. So Prometheus endeavoured to obtain by request from Zeus, that they were merely under an obligation to sacrifice a portion, and could devote the remainder to their own uses. He slew two oxen, burnt the liver of both, converted, however, all the bones into one, the flesh into the remaining hide of the animals, and presented Zeus the choice. Zeus, deceived by appearances, selected the bones because they were a larger portion and left

the flesh in this way for human consumption. For this reason, when the flesh of sacrificial animals was consumed, the remaining portions, which were devoted to the gods, were burnt up in the same fire. Zeus, however, took away fire from men because by so doing he made it impossible for them to celebrate their feast. Little help the ruse gave him. Prometheus robbed him of the fire and in the excess of his joy flew back faster than he sped thither; for which cause, so the tale goes, the bringer of good news invariably brings "speed" with him. In this way the Greeks have directed attention to this progress in human culture and preserved and reclothed the same in myth for the mind.

(*b*) We may connect with the above as a similar example of a yet further degradation of animalism the traditions of famous *huntings*, such as we find ascribed to heroes, and handed down as sacred to grateful memory. In these the slaying of animals which appear as injurious foes, such as the strangling of the Numean lion by Heracles, the slaying of the Lernean hydra, the hunting of the Caledonian boar are set forth as something famous, by means of which the heroes contended for godlike rank, whereas the Hindoos punished with death as a crime the slaughter of certain animals. Unquestionably there is a further interplay of symbolism in deeds of this kind or they lie at the base of them. In the case of Hercules there is the fact of the sun and its course, so that such heroic actions supply an essential aspect of symbolical interpretation. These myths are, however, at the same time accepted in their express significance as beneficial hunts and were consciously recognized as such by the Greeks. We must here again in a similar relation recall certain fables of Aesop, especially those already referred to of the dung beetle. The dung beetle, that primitive Egyptian symbol, in whose balls of dung the Egyptians or the interpreters of their religious conceptions saw the world balls, comes in Aesop again before Jupiter, and with the important change that the eagle does not respect his

protector the hare. Aristophanes, on the other hand, has wholly made fun of him.

(*c*) *Thirdly*, the degradation of the animal is directly indicated in many of the tales of metamorphosis as Ovid has delineated them for us in detail with grace and talent and fine traits of feeling and intuition, but also composed in a rambling way without their great and commanding ideal significance, treating them merely as the sport of mythos and external fact and failing to recognize a deeper significance. Such a deeper significance is, however, there, and we will consequently, now we mention the subject, make further allusion to it. For the most part the particular narratives are if we look at this material, quaint and primitive, not so much on account of the depraved condition of the culture, but rather, as in the Nibelungenlied, on account of the condition of a still raw nature. As far as the thirteenth book, according to their content, they are older than the Homeric tales; add to this they are a medley of cosmogony and heterogeneous elements of Phoenician, Phrygian, Egyptian symbolism, treated no doubt in a human way, but in such wise that the uncouth stock still remains, whereas the metamorphoses which enumerate tales of a later period subsequent to the Trojan war, although their material is also borrowed from fabulous times, clash awkwardly with the names of Ajax and Aeneas.

(*α*) Generally speaking, we may regard the metamorphoses as a contrast to the conception and worship implied in animalism. Looked at from the ethical side of Spirit they include essentially the negative attitude toward Nature, making the animal and other inorganic forms a phase of human degradation. Consequently, if among the Egyptians the gods of Nature's elements are exalted and made vital in animals, here conversely, as we have already intimated, the natural form appears before us as an easier or difficult lapse and a monstrous crime, as the existence of an ungod-like, unfortunate thing, and as the embodiment of pain, in which the human is no longer able

to remain self-contained. For this reason they have not the significance of the migration of souls in the Egyptian sense of that expression; this is a migration which does not imply guilt, but rather is on the contrary, if we take the case of the passage of the human soul into the animal, regarded as an exaltation.

As a whole, however, this is no severely exclusive circle of myths, however different the objects of Nature may be, into which that which is spiritual is banished. A few examples will sufficiently elucidate the point.

Among the Egyptians the wolf plays a part of great importance, as, for example, in the case where Osiris appears as beneficent protector of his son Horus in the latter's conflict with Typhon, and in a whole series of Egyptian coins is represented as the assister of Horus. And speaking generally the association of the wolf and the sun-god is a primitive one. In the "Metamorphoses" of Ovid, on the other hand, the conversion of Lycaon into the form of a wolf is presented us as a punishment for his impiety. After the subjugation of the giants, we are told[143], and after the annihilation of their bodily shapes the Earth, warmed by the blood of its sons which had been scattered in all directions, revitalized the warm blood, and, in order that no vestige of the former wild stock should remain, brought into being a race of men. Yet for all that was this after-birth contemptuous of the gods, eager for savage deeds and murder. Then Jupiter called the gods into conclave with a view to destroy this mortal race. He informed them how Lycaon had cunningly formed stratagems against himself, the wielder of the lightning and their sovereign lord. When, such is the story, the worthlessness of the times was apparent to him, he descended from Olympus, and came to Arcadia. "I furnished signs," the narration continues, "that a god had drawn nigh and the people began to supplicate." First, to make merry over these pious prayers was Lycaon, who forthwith cried out: "I will make experiment whether this indeed be a god or mortality, and the truth shall not

remain in doubt." "He made preparation," continued Jupiter, "to slay me when oppressed with slumber; he was possessed with the passion for discovering the truth. And not contented with this, he made an incision with his sword in the throat of a goat of Molassian pedigree and boiled as to one part the only partially dead members; and as to the rest baked them on the fire, and placed both portions before me to eat. Wherefore I, with avenging flame, have laid his homestead in ashes. Affrighted he fled forth from thence, and when he reached the silent field he broke forth: in howls and strove in vain to utter speech. With rage in his jaws and in the eagerness of his animal lust for murder he turned against the cattle, and rejoices even now in their blood; his garments have become the hairy hide, and his arms have turned into thighs. He is a wolf, and preserves the signs of the primitive shape."

The tale of Procne, who was changed into a swallow, sets before us the gravity of the committed abomination with a like emphasis. When, so the tale runs[144], Procne begs of her husband, Tereus — she happened at the time to stand in his favour — that he will, forthwith let her go to see her sister or suffer her sister to visit her, Tereus hastens to launch his vessel on the sea and quickly reaches the harbour of Piraeus with his seamanship. He, however, barely catches sight of Philomela before he is violently enamoured of her. At his departure Pandion, the father, binds him on oath to protect her with the love of a father, and to send back as soon as possible the alleviation of his old age. The voyage, however, is hardly over when the barbarous man deprives her — pale, trembling, already fearful of the worst, and beseeching with tears to know where her sister is — of liberty, and as twin-consort forces her to be his concubine along with her sister. Overcome with anger and thrusting all sense of shame on one side, Philomela threatens of her own accord to betray the deed. Tereus on this draws his sword, seizes and binds her and cuts off her tongue, informs, however, his wife by way of

evasion of the death of her sister. Thereupon the sorrowing Procne tears off the fine linen from her shoulders and puts on mourning apparel; she raises an empty tomb and in a mode somewhat out of place, as it happens, laments the lamentable fate of her sister. How then does Philomela meet this? A prisoner, robbed of all speech, of her voice, she bethinks her of craft. With threads of purple she works the news of the crime upon a white texture, and sends the raiment secretly to Procne. The wife reads the heartrending news of her sister; she neither speaks nor weeps; she lives wholly in the image of revenge. It was the time of the festival of Bacchus. Driven forth by the furies of her passionate grief she forces her way to her sister; she tears her from her chamber and carries her off with her away. Then in her own house, while she still is in doubt what terrible act of vengeance she shall exact on Tereus, Itys appears before his mother. She stares upon him with eyes of wildness. How like he is to his father! No further word she utters, but consummates at once the doleful deed. They slay the boy and serve him on his father's table, who partakes eagerly of his own flesh and blood. He then calls for his son, and Procne exclaims that he carries within him that which he calls for; and, as he still looks about him and seeks after him and again asks and calls for him, Philomela sets before his face the bloody head. Then he breaks away from table with an awful cry of anguish, and weeps and calls himself his son's sepulchre, and forthwith makes after the daughters of Pandion with the naked steel. But now supplied with wings they float away from thence, the one into the forest, the other into the roof; and Tereus also, despite all the energy of his sorrow and desire of revenge, is changed into the bird which rears on its crest the comb of feathers, and carries a beak of immoderate projection. The name of the bird is the hoopoe.

On the other hand, we have changes which proceed from a guilt of less significance. As examples, there is Cygnus who became a swan, and Daphne, the first love of Apollo[145], who was changed into the laurel, Clyde

into the heliotrope, Narcissus, who despised in his vanity maidens, and sees himself in the watery mirror, and Biblis[146], who was enamoured of her brother, and is, when he scorns her, changed into the spring which even now bears her name and flows beneath the shading oak.

However, we must not lose ourselves in further digression through particular examples, and I will merely, by way of passage, and the one further reference to the change of the Pierides, who, according to Ovid[147], were the daughters of Pieros and challenged the Muses to a match of rivalry. For ourselves the distinction of importance is the nature of the songs which the combatants sang respectively. The Pierides celebrate the battles of the gods[148] and honour the giants unduly while they depreciate the deeds of the great gods. Rising up from the depths of Earth, Typhoeus filled heaven with fear; in a body the gods take flight from thence until, wearied out, they rest on Egyptian soil. But here, too, so sang the Pierides, Typhoeus arrives, and the high gods are fain to hide themselves in illusive shapes. Jupiter was leader of the army, and for this reason, so ran their refrain, the Lybian Ammon to this day is figured with crooked horns; and in like manner the scion of Semele is changed into a ram, the sister of Phoebus into a cat, Juno into a snow-white cow, Venus is concealed in a fish, Mercury in the feathers of Ibis.

Here we find therefore the gods suffer reproach in their change to animal form. Although their translation is not presented as a punishment for a wrong or a crime, it is their cowardice which is held forth to us as the reason of this self-imposed metamorphosis. Calliope, on the other hand, exalts in song the good deeds and history of Ceres. Ceres was the first, so ran the strain, to scour through the fields with the crook-backed ploughshare; first was she to give fruits and fruitful means of nourishment to the ploughed fields. First was she to lay down laws for our guidance; we are collectively but a gift of her wisdom. “Ah,” she exclaims, “my task is to

celebrate her, and yet how shall I tune my strain worthy of such a goddess! Assuredly the goddess is worthy of the singer's best." When she has finished, the Pierides adjudge themselves victors in the contest: but even as they endeavour to speak, and with loud cries, so Ovid informs us (v. 670), are flourishing about with their hands, they perceive their nails passing away into feathers, their arms become covered with down, while each is aware that the mouth of the other is closing up into the stiff bill of a bird: and while they are all for deploring their lot, they are carried up on the waves of their wings, they float away, the screamers of the woods, and as waifs of the air. And even unto this day, adds our poet, they still retain their own glibness of tongue and excited chatter, and infinite desire to gossip. In this way we find again also here that metamorphosis is presented us as punishment, and, what is more, is presented, as is so frequently the case with such stories, as punishment due to religious impiety.

(*β*) If we consider further examples of still well recognized metamorphoses of men and gods into animals, we shall find that, although they do not directly imply any transgression as the cause of such a change, as, for example, in the case where Circe possessed the power to change men into animals, yet, for all that, the animal condition is at least indicative of a misfortune and a humiliation, such as brings no honour even to the person who makes such a change subservient to private ends. Circe was quite a subordinate, obscure type of goddess, and her power appears as mere witchery, and Mercury assists Odysseus, when the latter contrives to free his comrades from the spell. Of much the same kind are the many shapes which Zeus takes upon himself, as, for example, when he is changed into a bull in his quest of Europa, or when he approaches Leda in the form of a swan, or fructifies the Danae in a shower of gold. In all these cases the object is one of deception, directed by purposes of an inferior, that is to say, not spiritual, but purely natural quality, purposes which the ever constant

jealousy of Juno render unavoidable. The conception of a universal procreative life of Nature, which in many of the more ancient mythologies constituted the leading motive, is imaginatively reproduced in separate poetical tales about the easily enamoured disposition of the father of gods and men, exploits, however, which he does not carry through in his own or, for the most part, in human shape, but expressly either in the shape of animals, or some other embodiment of Nature.

(γ) And, lastly, we may add to our list those hybrid forms, combining both humanity and animalism, which are also not excluded from Greek art, though the animality is here accepted as something that degrades, is unspiritual. Among the Egyptians, for example, the he-goat, Mendes, was revered[149], and, according to the opinion of Jablouski[150], in the sense of the procreative power of Nature, generally speaking, as that of the sun, and to such an outrageous excess that, according to Pindar, even women sacrificed themselves to these creatures. Among the Greeks, Pan, on the contrary, personifies the mysterious sense of the divine presence, and later in the shape of fauns, satyrs, and Pan-like figures, the goat shape only appeared in a subordinate way, such as in the feet, and in the most beautiful representations was perhaps limited to the pointed ears and little horns. The rest of the figure is shaped in human guise, and the animal suggestion thrust back upon the barest detail. Yet, for all that, fauns were not recognized among the Greeks as gods of any important rank or spiritual forces; their fundamental characteristic remained that of a sensuous, uncontrolled joviality. It is true that they are also artistically represented with an expression of profounder significance, as, for instance, that fine example of one in Munich, which holds the youthful Bacchus in his arms, and gazes down on him with a smile which is brimming over with love and tenderness. He is not to be taken as the father of Bacchus, but merely the foster-parent, and we find given him here the beautiful feeling of joy in the

innocence of the child, such as that which, in the maternal devotion of Mary for the Christ babe, is exalted in romantic art to so lofty a level of contemplation. Among the Greeks, however, this most charming love still belongs to the subordinate sphere of fauns in order to indicate that its origin is traceable from animal, that is natural, life, and consequently is entitled to rank with such a sphere[151].

Mediate shapes of a similar kind are the centaurs, in which we may also observe that the Nature-aspect of sensuality and desire is also supremely prominent to the suppression of the spiritual side. Cheiron, no doubt, is of a more noble type, a clever physician, and the tutor of Achilles; but this instructive *rôle*, as the teacher of a child, is not appropriate to godhead strictly, but is to be related with human ability and cleverness.

In this manner the relation of the animal shape receives a modification in classical art from whatever point of view we regard it. Its prevailing employment is to indicate that which is evil, bad, inferior, merely natural and unspiritual, whereas, outside Greece it was the expression of the positive and absolute.

2. THE CONTEST BETWEEN THE ANCIENT AND MODERN DIVINITIES

The second grade of more elevated rank we may contrast with the degradation of the animal condition consists in this, that the genuine gods of classical art, inasmuch as they possess for their content a free self-consciousness, which we may define as the power of spiritual individuality reposing on its own resources, are also able to be represented as subjects of knowledge and volition, that is as spiritual potences. For this reason the *humanity*, in the bodily form of which they are presented us, is not, as one may say, a mere form, which is girt about this content by virtue of the imagination under a mode of purely external validity, but is rooted in the

significance, content, and ideal substance itself. The divine, however, generally speaking, is essentially to be apprehended us unity of the natural and spiritual; both sides are involved in the conception of the Absolute; and it is merely the different mode, under which this harmony is conceived, which constitutes from our present point of view the respective grades of the various forms of art and historic religions. According to our own Christian way of looking at it, God is the creator and lord of Nature and the spiritual world, and therewith, no doubt, exempted from the immediate and determinate existence of Nature, for the reason that, before all else, he is very God as the taking back into Himself of his own fulness, that is as absolute and self-dependent Spirit; it is only the finite and human spirit which stands in opposition to Nature as a limit and a bound, a limitation which such only thereby overcomes in his determinate existence, and exalts himself intrinsically to the grade of infinity in so far as he grasps Nature contemplatively in thought, and in the actual world[152] consummates the harmony between spiritual idea, reason, the Good and Nature. This infinite actualization is, however, God, in so far as the lordship over Nature is strictly due to Him, and He Himself is conceived as explicit in this infinite activity, and the knowledge and volition of such realization.

In the religions of strictly symbolic art, on the contrary, as we have traced already, the union of the Inward and Ideal with Nature was an immediate association, which consequently made use of Nature both as regards its substance and form as its fundamental mode of determination. In this sense the sun, the Nile, the sea, the Earth, the natural processes of birth, death, procreation, and reproduction, in short, all the varied changes of the universal life of Nature were revered as divine existence and life. These Nature-forces, however, were even in symbolic art personified, and consequently set up in contrast to the spiritual. If, however, and nothing less than this is the requirement of classical art, the gods are to be spiritual

individualities in harmony with Nature, mere personification is a conception insufficient for this result. For personification, in the case that its content is a purely universal force and activity of Nature, persists as a mere form, unable to penetrate to the constituting substance, and can neither give existence to the spiritual content in the same, nor its individuality. We find therefore necessarily in classical art a change of front[153], to the effect that, in conformity with the degradation of the animal aspect we have just been considering, the universal power of Nature also in one aspect of it suffers humiliation, and the spiritual is proportionally exalted in contrast to it. And by this means we find that it is the principle of *subjectivity*, rather than mere personification, which becomes the main mode of definition. From another point of view, however, the gods of classical art do not cease to be potences of Nature, because God here has not yet come to be represented as essentially absolute and free spirituality. In the relation of a merely created and ministrant creature to a lord and creator separated from it, Nature stands, however, albeit deified, either as we have it in the art of the Sublime — conceived as an essentially abstract, that is purely ideal masterdom of one supreme substance, or — as in the case of Christianity — exalted as concrete Spirit to absolute freedom within the pure element of spiritual existence and personal actuality. Neither of these examples falls in with the point of view of classical art. God here is not as *yet* lord of Nature, for the reason that he does not as yet possess absolute spirituality either if regarded relatively to what is contained in Him, or to the mode under which He is apprehended. He is no longer lord of Nature, because the sublime relation of the deified natural thing and human individuality has ceased, and taken upon itself the limitations of beauty, in which their just due must be rendered for art's representation without any tittle of loss to both aspects, the universal and the individual, the spiritual and the natural. Consequently in the god of classical art the nature-potency is preserved, but is conceived

as such not in the sense of the universal and all-embracing Nature, but as the definable, and consequently limited activity of the sun, sea, and so on, generally speaking, as a particular natural potency, which is made visible as spiritual individuality, and possesses this spiritual individuality as its essential being.

For the reason, then, as we have already made clear, that the classical Ideal is not immediately present, but first makes its appearance through the process in which that which is negative to the formative content of spirit is resolved, this transformation and building up into new forms of that which is raw, unbeautiful, wild, grotesque, purely natural, or fantastic, which originated in earlier religious conceptions and views of art, will be a leading interest in Greek mythology, and consequently will necessarily reproduce a readily defined sphere[154] of particular significances.

In proceeding further to examine this fundamental aspect of our present subject I must at once give utterance to the preliminary caution that the historic investigation of the varied and multifold conceptions of Greek mythology lies outside our present task. All we are concerned to inquire into here are the essential phasal steps of this process of reconstruction, in so far as the same notify themselves as phases of universal import in the new artistic configuration and its content. As for that infinite mass of particular myths, narrations, histories, things referable to a local origin and symbolism, which collectively still assert their predominance in the world of later gods, and incidentally appear in artistic production, but for all that do not belong to the vital point of interest to which our own effort is directed — we must necessarily leave all this broad field of material on one side, and can merely refer to an example or two by way of illustration. Speaking generally we may compare this road, on which we now move forwards, to the course of the history of sculpture. For inasmuch as sculpture places before the observation of sense the gods in their real form

it constitutes the peculiar *centrum* of classical art, albeit also the better to make it wholly understood poetry expresses itself upon gods and mankind, or passes in review the worlds of gods and men in their activity and movement in direct contrast to that objectivity self-contained in repose. Just as, then, in sculpture the moment of all importance in the beginning is the transformation of the formless, the stone or block of wood that has fallen from heaven (διοπετὴς) — as the the great goddess of Pessinus in Asia Minor actually was, which the Romans directed by means of a solemn embassy to be transferred to Rome — into the human form and so makes the statue, so too we have here to make a beginning from the formless, uncouth powers of Nature, and while doing so merely to indicate the stages, in their passage through which they are exalted into spiritual individuality and are finally concentrated in shapes of fixity.

We may in this connection distinguish three separable aspects as of most importance.

The *first*, which arrests our attention, are the *oracles* in which the knowledge and volition of gods, still under a formless mode, gives witness to their presence through natural existences.

The *second* point of view to be noted is concerned with the universal forms of Nature, no less than the abstractions of Right and so forth, which lie at the root of the genuine spiritual and individual deities, which are, so to speak, their birth-cradles and furnish us with the necessary conditions of their origin and activity: they are the old gods in contradistinction to the new.

Thirdly, and finally, we are made aware of the essentially necessary progress to the Ideal in the fact that the primarily superficial personifications of the activities of Nature and the most abstract spiritual conditions are contested and thrust from their prominence as something essentially subordinate and negative and, by virtue of this debasement the

self-sufficient spiritual individuality and its human form and action, is suffered to attain an unchallenged masterdom. This revolution, which constitutes the real central position in the historical origins of the classic gods, is in Greek mythology placed before our imagination in the conflict — a mode of presentation as naïve as it is astonishingly direct — between the old and new gods, in the headlong fall of the Titans, and in the victory which the divine race of Zeus secures.

(*a*) To take, then, first in order the *oracles*, it will not be necessary for us now to dilate on them to any considerable extent. The essential point which concerns us here is merely due to this fact, that in classical art the phenomena of Nature are no longer revered as such — in the way that the Parsees, for example, pray to naphthetic regions or fire, or as among the Egyptians, gods remain inscrutable, mysterious, and mute riddles — but that the gods, being themselves subjects of knowledge and volition, do verily give to man by means of natural phenomena indications of their wisdom. In this sense the ancient Hellenes made inquiry at the oracle of Dodona[155], whether they should accept the names of gods, which have come to them from barbarians, and the oracle replied: "Use them."

(*α*) The signs by means of which the gods thus made their revelations are for the most part of the simplest description. At Dodona such were the rustle and whisper of the sacred oak, the murmur of the spring, the tones of the brazen vessel, which the wind made thus to reverberate. In like manner at Delos it was the laurel which rustled and at Delphi, too, the sound of the wind on the brazen tripod was full of significance[156]. Over and above, however, such immediately natural sounds man is also the voice-piece of the oracle in so far as he is rendered deaf to and whirled away from the alert commonsense of his ordinary mind to a natural condition of enthusiasm; as, for example, the Pythia at Delphi was wont, stupefied by exhalations, to deliver the oracular words, or in the cave of Trophonius the inquirer of the

oracle met with faces, from the interpretation of which an answer was delivered him.

(*β*) There is, however, another aspect which we should set alongside of the purely external sign. For in the oracles God is, it is true, accepted as He who *knows*, and the oracle of most famed repute is dedicate to Apollo, the god of wisdom. The form, however, in which he reveals his will, remains the wholly indefinite voice of Nature, either a natural sound, that is, or the unconnected tones of words. In this obscurity of form the spiritual content is itself equally obscure and requires *interpretation* and explanation.

(*γ*) This explanation, albeit it brings under a mode of spiritual life the deliverance of the god which in the first instance is presented purely in the form of Nature's own voice, remains despite this fact obscure and equivocal. For the god is in his knowledge and volition concrete universality. And of the same type also must the advice or command unavoidably be which the oracle declares. The universal, however, is not one-sided and abstract, but as concrete universal contains the one side no less than the other. Inasmuch, then, as man stands over against the knowing god as one unknowing he accepts the oracular word itself in ignorance. In other words, the concrete universality of the same is not open to his intelligence, and he can merely select from the equivocal word of the god, assuming that he decides to act upon it, *one* aspect thereof, for the reason that every action under particular circumstances is unavoidably *definite*, only, that is to say, giving a decisive impulse in *one* direction and shutting off another. His action is barely accomplished, and the deed — which consequently has become his own and for which he must now be answerable — really carried through when he finds a collision confronting him. All in a moment he is aware that the other side, which lay already folded in the oracular sentence, is turned against himself and the fatality of his deed, his knowledge and will notwithstanding, has him in the toils; a

fatality which he may not know, but of which we must suppose the gods are aware. Conversely again the gods are determinate potencies and their expressed will, when it carries this character of essential determinacy, as, for example, the bidding of Apollo, which drives Orestes forward to his revenge, brings about a collision of forces in the selfsame way. For the reason, then, that in one aspect of it the form, which the spiritual knowledge of the god assumes in the oracle, is the wholly undefined external expression or the abstract ideality of the word, and the form itself through the equivocal sense it contains includes the possibility of discord, we find that in classical art it is not sculpture, but poetry, and pre-eminently dramatic poetry, in which oracles contribute their share of the content and are of importance. In *classical* art, however, they do essentially maintain a place, because in it human individuality has not forced its way to the full height of spiritual attainment, where the subject draws the determination of his actions without infringement from his own resources. What we in our modern sense of the term call conscience, has not as here secured its rightful place. The Greek acts often, it is true, at the beck of his passion, bad no less than good; the genuine pathos, however, which is here held to quicken him, and does in fact so quicken him, proceeds from the gods, whose content and might is the universal of such a pathos; and the heroes are either immediately instinct with the same, or they interrogate oracles for advice, when the gods do not present themselves openly to their vision, by way of quickening the deed to be done.

(*b*) Moreover, as in the oracle the *content* is to be found in the gods that *know* and *willy* while the form of the external phenomenon is the external which is abstract and a part of *Nature*, from the other point of view that which is *natural*, if we look at it relatively to its universal forces and the activities which belong to these, becomes the *content*, from out of which the independent individuality has first to force its way up, and receives as its

original form merely the formal and superficial personification. The thrusting back of these purely natural forces, the opposition and contention through which they are overcome is just the significant centre, for which we are indebted primarily to classical art, and which we must consequently submit to a closer examination.

(*α*) The first thing we would remark in this connection is attributable to the circumstance that we are not here concerned — as in that view of the world which belongs to the Sublime, or in part even that appropriate to Hindoo doctrines — with God already essentially devoid of any relation to sense, when regarded as the starting point of all creation, but rather with that in which Nature's gods, and we may add in the first instance the more universal forces of Nature such as Chaos, Tartarus, Erebus, the entire savage and subterranean substance, and, furthermore, Uranos, Gaia, the Titan Eros, Kronos, and the rest, supply the beginning[157]. It is from out of these, then, that the better defined powers, such as Helios, Oceanos, and others like them first have their being; while they, in their turn, become the natural cradle for the later spiritual and individualized divinities. We find, therefore, again here another theogony and cosmogony which is the work of the imagination, whose earliest gods, however, still remain for the observer under one aspect of an undefined character, or vaguely extend beyond all reasonable limit; and, if viewed from another standpoint, still carry with them much that is essentially symbolical.

(*β*) The more detailed distinctions among these Titan potencies may be thus indicated:

(*αα*) First, we have those powers of the Earth and the stars, without spiritual and ethical content, consequently dissolute, a raw, savage race, gigantic and formless, as though they were scions of Hindoo or Egyptian imagination. They are to be classed with other individualities of Nature such as Brontes, Steropes, and again with the hundred-handed Kottos,

Briareus, and Gyges, the giants and the rest standing in the first instance beneath the lordship of Uranos, then of Kronos, that chief of the Titans, who obviously is a kind of personified *Time*, devouring all his children, just as Time eventually annihilates everything that it has brought to birth. This myth is not without a symbolical significance. For the life of Nature is, in fact, subjugate to Time, and brings only the Past into existence, just as in the same way the prehistoric times of some people, which is only one nation, one stock, yet constitutes no genuine State, and pursues no definite objects essentially made clear to itself, becomes the sport of the power of a Time, which is destitute of history. We touch solid ground for the first time when we come to law, morality, and the State, something permanent which remains though races pass away, as it is said that the Muses give permanence and a defence to everything, which, as the life of Nature and present action, had only vanished swept away with Time.

(*ββ*) But, further, it is not only that the forces of Nature belong to this sphere of the old gods, but also the forces noted as earliest over the elements. In particular the first active agency upon metal through the force of what is still raw, and elementary Nature, that is air, water, fire, is of importance. We may mention in illustration the Corybantes, the Telchines, demons of both beneficent and evil influence, the Pataeci, pygmies, dwarfs, cunning in the woodman's craft, small, with big paunches.[158]

More prominent notice should be taken of Prometheus, as illustrating in the chief place a fundamental point of new departure. Prometheus is a Titan of exceptional type and deserves exceptional attention. Together with his brother Epimetheus he appears in the first instance as favourable to the young gods; then he stands out as the benefactor of men, who in other respects have no defined relation with the new gods or the Titans. He brings fire to man, and thereby supplies them with the means of satisfying their needs and working the technical arts, which are no longer, however,

regarded as natural products, and consequently it would appear do not stand in any closer association with Titan workmanship. For this interference Zeus punishes Prometheus until Hercules finally releases him from suffering. At the first glance there would appear to be nothing strictly Titanesque in these main features of the story; nay, it would not be difficult to point out an inconsequence in the fact that Prometheus, just as Ceres, is a benefactor of mankind, and is none the less numbered among the old Titanic potencies. If we look at the matter more closely, however, this inconsequence will at once disappear. In this connection several passages from Plato's works will help us sufficiently to clear the difficulty. There is the myth in which the guest-friend recites to the younger Socrates that in the time of Kronos men originated from the Earth, while the god, on his part, devoted his attention to the whole[159]. After this step a movement of opposite tendency sprang up, and the Earth was left to itself[160], so that now the beasts became savage, and mankind, whose means of nourishment and all their other needs had hitherto passed immediately into their hands, were left alone without advice or assistance. Well, according to this myth, it was in such a condition[161] that fire was brought to mankind by Prometheus, all other accessories of craftsmanship being communicated by Hephaestos and his companion in craftsmanship, Athene.

Here we have notified expressly a distinction between fire and the thing which artistic ability produces by working on the raw material; and only the gift of fire is ascribed to Prometheus. Plato narrates the myth of Prometheus at greater length in the "Protagoras." There we read[162]: "There was once a time when gods indeed existed, but mortal beings had not appeared. When the foreordained time of their birth also had come, the gods created them in the inward parts of the Earth, composing their substance of Earth and fire and that which is the union of both these elements. When the gods were desirous of bringing them into the light, they handed them over to

Prometheus and Epimetheus to apportion and arrange the energies of each singly as was right. Epimetheus, however, requested of Prometheus that the apportionment might be left to him. After I have done this, quoth he, you may mark and express an opinion. Epimetheus, however, by a blunder apportioned everything worth having to the animal world, so that there was nothing left over for mankind; and when Prometheus made his inspection he found that though all other living things were wisely provided with all their needs mankind remained naked, unprotected, without covering or weapons. But already the appointed day had appeared in which it was necessary that man should pass from the bowels of the Earth into the light. In the embarrassment in which he was placed to procure some assistance for mankind Prometheus stole the wisdom that is shared by Hephaestos and Athene by taking fire — for without fire it would be impossible to possess it or make it of use — and made a present of this to men. Man now, it is true, possessed the wisdom necessary for the support of his life, but he was still *without political wisdom*, for this was still lodged with Zeus. Entry, however, to the stronghold of Zeus was no longer permitted Prometheus, and apart from this the awful watchers of Zeus barred the way. He passed, however, secretly into the chamber which Hephaestos and Athene shared in the practice of their art, and having secured the forging-art of Hephaestos he pilfered that other art (the art of weaving) which was possessed by Athene and presented this to mankind. Out of these possessions the means of satisfying the needs of Life is provided for man (ἐυπορία τοῦ βίου)." Prometheus receives, however, as already narrated, punishment for the thefts he commits owing to the blunders of Epimetheus.

Plato further tells us in a passage which immediately follows the above that mankind was still destitute of the art of war for their protection against the animal world, which was merely a part of the art of politics, and consequently were collected into cities, and would have so outraged each

other and finally broken up such asylums for the reason that they were without all political organization, that Zeus found it necessary to send down to them under the escort of Hermes Shame and Right.

In these passages the distinction between the immediate objects of life, which are related to physical comfort, that is, the provision for the satisfaction of the most primary necessaries and political organization, such as sets before itself as its object what is spiritual, custom, law, right of property, freedom, and communal existence is expressly emphasized. This principle of ethical life and right[163], Prometheus did not give to men, he merely taught them the cunning by means of which they might overcome natural objects and make them serviceable to their needs. Fire and the craftsmanship which makes use of fire have nothing ethical about them in themselves; and it is just the same with the art of weaving; in the first instance they are devoted to the exclusive service of private individuals, without coming into any relation with that which is shared in human existence or with Life in its public character. For the reason, then, that Prometheus was unable to furnish mankind with anything more spiritual or ethical, he also does not belong to the race of new gods, but to the Titans[164]. Hephaestos, it is true, also possessed fire and the particular crafts to which it is essential as an instrument for his field of activity, and is none the less accredited as a new god: but Zeus cast him from Olympus, and he continued to limp ever after. Just as little is it, therefore, an inconsequence when we find Ceres placed among the younger gods, who proved herself a benefactor of mankind just as Prometheus did. For that which Ceres taught was agriculture, with which at the same time property, and yet more, marriage, social custom, and law stand in close association.

(*γγ*) A third class of the ancient gods contains, it is true, neither personified potencies of Nature, as such, nor the might which next follows as lord over the particular elements of Nature in the service of the more

subordinate human necessities, but is already contestant with that which is essentially in itself ideal, universal, and spiritual. What, however, is none the less lacking in the powers we have here to reckon with is spiritual individuality and its appropriate form and manifestation, so that they also more or less relatively to their operations keep a position which is more nearly akin to the necessity and essential being of Nature. In illustration of this type we may recall the conception of Nemesis, Dike, the Erinnyes, Eumenides, and Moirai. No doubt we find associated with these figures the determinate notions of right and justice; but this inevitable right, instead of being conceived and clothed in the essentially spiritual and substantive medium of social morality[165], remains either persistent in the universal abstract notion, or is related to the obscure right of that which is natural within the circle of spiritual connections, the love of kindred, for example, and its paramount claim, which does not appertain to Spirit in the open freedom of itself self-recognized; and consequently also does not appear as lawful right, but in opposition to this as the irreconcilable right of revenge.

To bring the view of the above nearer I will merely draw attention to one or two ideas bound up with it. Nemesis, for example, is the might to humiliate the exalted, and to cast down the man all too fortunate from his lofty seat, and consequently to restore equilibrium. The claim or right of equilibrium is the purely abstract and external right, which, it is true, certifies itself as operative in the range of spiritual circumstances, and conditions, without, however, making the ethical organization of the same the content of justice. Another aspect of importance attaches to this circumstance, that the right of the family-condition is apportioned by the ancient gods, in so far as these repose on a condition of Nature, and thereby are in antagonism with the public right and law of the community. We may adduce the Eumenides of Aeschylus as the clearest illustration of this point. The direful maidens pursue Orestes on account of the murder of his mother,

a murder which Apollo, the younger god, had directed, in order that Agamemnon, the slaughtered spouse and king, should not remain unavenged. The entire drama consequently is concentrated in a conflict between these divine Powers, which confront each other in person. On the one side we have the goddesses of revenge, the Eumenides; but they are called here the beneficent, and our ordinary conception of the Furies, into which we convert them, is set before us as rude and uncouth. For they possess an essential right thus to persecute, and are therefore not merely hateful, wild, and ferocious in the torments which they impose. The right, however, which they enforce as against Orestes is only the family-right in so far as this is rooted in the blood relation. The profoundest association of son and mother is the substantive fact which they represent. Apollo opposes to this natural ethical relation, rooted as it is already both on the physical side and in feeling, the right of the spouse and the chieftain who has been violated in respect to the highest right he can claim. This distinction is in the first instance brought to our notice in an external way since both parties are champions for morality within one and the same sphere, namely the family. The sterling[166] imagination of Aeschylus has, however, here — and we cannot sufficiently value it on this score — discovered for us a contradiction, which is not by any means a superficial one, but of fundamental significance. That is to say, the relation of children to parents reposes on the unity of the natural nexus; the association of man and wife on the contrary must be accepted as marriage, which does not merely proceed from purely natural love, that is from the blood or natural affinity, but originates out of a conscious inclination, and for this reason belongs to the free ethical sphere of the self-conscious will. However much, therefore, marriage is bound up with love and feeling it is none the less to be distinguished from the purely natural emotion of love, because it also freely recognizes definite obligations quite independent of the same, which persist

when that feeling of love may have ceased. The notion, in short, and the knowledge of the substantiality of marital life is something later and more profound than the purely natural connection between mother and son, and constitutes the beginning of the State as the realization of the free and rational will. In like manner we shall find resident in the relation of prince to citizen the association of a similar political right, law, and the self-conscious freedom and spirituality of similar social aims. This is the reason why the Eumenides, the ancient goddesses, pursue Orestes with punishment, whereas Apollo — the clear, knowing and self-consciously knowing ethical sense — defends the right of the spouse and the chief, justly opposing the Eumenides: "If the crime of Clytemnestra were not scented out I should be in verity without honour and despised as nought by the consummator Here and the Councils of Zeus[167]."

Of still greater interest, albeit wholly involved in human feeling and action, is the contradiction which we have set before us in the "Antigone," one of the most sublime, and in every respect most consummate work of art human effort ever produced. Not a detail in this tragedy but is of consequence. The public law of the State and the instinctive family-love and duty towards a brother are here set in conflict. Antigone, the woman, is pathetically possessed by the interest of family; Kreon, the man, by the welfare of the community. Polynices, in war with his own father-city, had fallen before the gates of Thebes, and Kreon, the lord thereof, had by means of a public proclamation threatened everyone with death who should give this enemy of the city the right of burial. Antigone, however, refused to accept this command, which merely concerned the public weal, and, constrained by her pious devotion for her brother, carried out as sister the sacred duty of interment. In doing this she relied on the law of the gods. The gods, however, whom she thus revered, are the *Dei inferi* of Hades[168],

the instinctive Powers of feeling, Love and kinship, not the daylight gods of free and self-conscious, social, and political life.

(*γ*) The *third* point, which we would advert to in connection with the theogony of the outlook of artists in the classic period, has reference to the difference between individuals of the older gods relatively to their powers and the duration of their authority.

(*αα*) In the first place, the origin of these gods is a succession. From Chaos, according to Hesiod, proceeds Gaia, Uranos, and others, after that Kronos and his race, finally Zeus and his subjects. This succession appears in one aspect of it as a rise from the more abstract and formless to the more concrete and already fairly defined powers of Nature; in another as the beginnings of the superiority of the spiritual over the natural. Thus in his "Eumenides" Aeschylus makes the Pythia in the temple of Delphi begin with the words: "First of all I revere in my prayer her who first gave us oracles, Gaia, and after her Themis, who as second after her mother had her prophetic seat in this place." Pausanias, on the other hand, who also names the Earth first as giver of oracles, says that Daphne was ordained by her afterwards in the prophetic office. In another series again Pindar places Night in the first place, after her he makes Themis follow, then comes Phoebe, and finally he closes the succession with Phoebus. It would be of interest to analyse more closely these particular differences; such an inquiry, however, lies outside our present purpose.

(*ββ*) This succession further, in addition to its aspect of being an extension into essentially profounder conceptions of godhead, possessing, that is, a fuller content, also appears as the degradation of the earlier and more abstract type within the range of the older race of gods itself. The primary and most ancient powers are robbed of their masterdom, just as we find Kronos dethroned Uranos, and the later representatives are set up in their place.

(*γγ*) In this way the negative relation of the reformation[169], which we settled at once to be the essence of this first stage of the classic type of art, becomes the proper centre of the same. And it is so for the reason that personification is here the universal form, in which the gods are presented to the imagination, and the progressive movement comes into opposition with human and spiritual individuality. And although this appears in the first instance still in a form indeterminate and formless, we necessarily find that the imagination presents this negative attitude of the younger gods against the more ancient under the image of conflict and war. The essential advance is, however, from Nature to Spirit, implying by the latter the true content and the real form appropriate to classical art. This progress and the conflicts by means of which we perceive that it is carried forward, belong no longer exclusively to the sphere of the old gods, but centre in the war through which the new gods lay the foundation of their enduring mastery over the ancient.

(*c*) The opposition between Nature and Spirit is in the nature of the case inevitable. For the notion of Spirit, as in very truth totality, is, as we have already seen, *essentially* simply this, to split itself in twain, that is into its intrinsic constituents as objectivity and as subject, in order that by means of this opposition it may emerge from Nature and confront the same forthwith free and jubilant as vanquisher and superior might. This fundamental phase, rooted in the very essence of Spirit, is consequently a material aspect in the conception which it supplies to itself of that nature. Regarded historically, that is on the plane of ordinary reality, this passage asserts itself as the reconstruction through progressive steps of the natural man into the condition where right, property, laws, constitution and political life are paramount. Regarded under a mode which relates this process to gods and *sub specie eternitatis* it becomes the conception of the victory over the natural Powers by means of the spiritual and individual Divinities.

(*α*) This contest exposes an absolute catastrophe, and is the essential deed of the gods, by virtue of which the fundamental distinction between the old and new gods is first made visible. Consequently we ought not to point to the war, which exposes this distinction as a mythical story in the same way we should point to any other myth; rather we should regard it as the mythos, which in fact punctuates a great moment of transition, and expresses the creation of the later theogony.

(*β*) The result of this violent strife among the gods is the ruin of the Titans, the unique victory of the new gods, who forthwith receive in their assured dominion a plenitude of gifts in every direction from the imagination. The Titans, on the other hand, are banished, and compelled to huddle in the hollows of the Earth, or, like Oceanos, dally on the dark skirts of the clear, joyful world, or still endure many grievous punishments. Prometheus, for example, is fettered on the Scythian mountains, where an eagle insatiable devours the liver that ever renews itself. In like manner an infinite and inexhaustible thirst torments Tantalus in the lower world, and Sisyphus is for ever constrained to roll up hill in vain the rock that for ever rolls back again. These punishments are, in truth, the false type of infinity, the yearning of the indefinite aspiration or the unsatisfied craving of natural desires, which in their eternal repetition fail to discover rest or final satisfaction. For the truly godlike intuition of the Greeks regarded the mere extension into space and the region of the indefinite, not, as some modern votaries of such longings do, as the highest attainment of mankind, but as a damnation which it relegates to Tartarus.

(*γ*) If we ask ourselves in a general way, what from this point must for classical art fall into the background, failing, that is, to have any right to figure as its final form and adequate content, we shall find at the earliest point of departure the elements of Nature. With them disappear from the world of the new gods all that is gloomy[170], fantastical, void of clarity, every

wild confusion between Nature and Spirit, between significances essentially substantive and the accidental incidents of externality. In a world such as this the creations of an unrestricted imagination, which has not yet for its principle the measure of spiritual proportion, have no place, and are compelled and justly so to vanish before the clear light of day. We may furbish up the monstrous Cabeiri[171], the Corybantes, these representatives of procreative force as much as we choose, yet for all that such presentations in every trait of them — to say nothing of the ancient Baubo, whom Goethe sets careering over the Blocksberg on an old sow — belong to a greater or less degree to the twilight of consciousness. Only that which is spiritual imperatively demands the light; and that which does not reveal itself and in itself expound its own interpretation is the unspiritual, which fades again once more into Night and obscurity. That which is of Spirit on the contrary reveals itself, and purifies itself, by itself defining its external form, from the caprice of the imagination, the flood of obstructing shapes, and the otherwise perturbed accessories of symbolical sense.

For the same reasons we now find that human activity, in so far as it is limited merely to Nature's wants and their satisfaction, falls into the background. That old right, Themis, Dike and the rest, as one not determinate through laws which originate in self-conscious Spirit, loses its unimpaired validity, and in the same way, if conversely, that which is purely local, albeit there is still room left for its play, passes by incorporation into the universal figures of the gods; in which we may still trace the lingering vestiges that remain of it. For as in the Trojan war the Greeks fought and conquered as *one* people, so, too, the Homeric gods, who already have their conflict with the Titans behind them in the past, are one essentially secure and defined god-world, a world which is yet further with ever-increasing fulness made definite and unassailable by later poetry and the plastic arts. This invincible consistency[172] is in its relation to the content of the Greek

world of gods Spirit and only Spirit; but not Spirit in its abstract ideality, but as identified with its external and adequate existence, just as with Plato soul and body, as in union brought into one nature and in this consolidation from one piece, is at once the Divine and Eternal.

3. THE POSITIVE CONSERVATION OF THE CONDITIONS SET UP THROUGH NEGATION

Despite, then, the victory of the new gods that which came before them still remains in the classical type of art partly preserved and revered in the original form in which we have already recognized it, partly under a transmuted mode. It is only the limited Jewish national god which is unable to tolerate other gods in its company for the reason that it purports as *the* one god to include everything, although in regard to the definition of its form it fails to pass beyond its exclusiveness wherein the god is merely the God of His own people. Such a god manifests his universality in fact only through his creation of Nature and as Lord of the heavens and the earth. For the rest he remains the god of Abraham, who led his people Israel out of Egypt, gave them laws on Sinai, and divided the land of Canaan among the Jews. And through this narrow identification of him with the Jewish nation he is in a quite peculiar way the god of this folk; and consequently, speaking generally, neither stands in positive consonance with Nature, nor appears truly as absolute Spirit referable back from his determinate character and objectivity to his universality. Consequently this austere, national god is so jealous, and ordains in his jealousy that men shall see elsewhere merely false idols. The Greeks, on the contrary, discovered their gods among other nations and accepted what was foreign among themselves. For the god of classical art has spiritual and bodily individuality and is for this reason not the one and only one, but merely a *particular*

godhead, which, as everything else that shares particularity, has a circle of particularity which surrounds it or in opposition to it as its Other, from which it is the result, and which is qualified to preserve its validity and worth. The process here is analogous to that of the particular divisions of Nature. Although the world of vegetation is the truth of the geological image of Nature, the animal again the higher truth of the vegetable, yet the mountains and the flooded land persist as the solid basis of trees, shrubs, and flowers, which in their turn do not lose their existence alongside the world of animals.

(*a*) The earliest form under which among the Greeks we come upon this ancient residue, are the *Mysteries.* The Greek Mysteries were nothing secret in the sense that the Greek nation was not in a general way aware of their content. On the contrary, the majority of the Athenians and a large number of foreigners were among the initiated in the Eleusinian mysteries; but they were not permitted to speak of that in which they had been instructed through initiation. In our own times people have been at great pains to discover more nearly the type of conceptions which prevailed in these mysteries, and to investigate the kind of religious services which were used in their celebration. It appears, however, that on the whole there was no extensive wisdom or profound knowledge concealed in the Mysteries. They merely preserved the old traditions, the basis, that is, of what was latterly reconstructed by the genuine type of art, and consequently, so far from containing the true, higher, and more valuable content, rather unfolded that which was of less significance and of inferior rank. Whatever it was, this holiness was not clearly expressed in the mysteries, but merely handed down in its symbolical features. And in fact this character of secrecy and reticence is bound up with the old telluric, sidereal, and Titanic deposit; Spirit alone is the revealed and the self-revealer. Consonant, too, with this it is the symbolical mode of expression which constitutes the other aspect of

secrecy in the mysteries, because in symbolism the interpretation remains obscure, and contains a something other than the external image, which it purports to display, in fact offers to the view. In this sense, for example, the mysteries of Demeter and Bacchus were, it is true, spiritually interpreted, and contained a profounder sense. The form of the same remained quite externally isolate from this content, so that it was impossible clearly to disengage it from it. Consequently the Mysteries had very little influence over art; for though we are told of Aeschylus, that he willfully betrayed something which attached to the Demeter mysteries, this merely amounts to an assertion on his part that Artemis had been the daughter of Ceres, which is not very profound wisdom after all.

(*b*) But, *secondly*, we find that the reverence and preservation of the old *régime* is yet more clearly indicated in actual artistic representation. We have already referred to Prometheus as the chastised Titan who appears in the stage immediately prior to that of genuine art. We meet with him however again as delivered. For as the Earth and as the Sun, so also the fire, which Prometheus brought down to men, that is, the eating of flesh, which he taught them, is an essential feature of human life, a necessary condition for the satisfaction of their needs; and consequently Prometheus is honoured with an enduring recognition[173]. In the Oedipus Colonos of Sophocles we have the words:

χῶρος μὲν ἱερὸς πᾶς ὅδ ἔστ· ἔχει δέ νιν
σεμνὸς Ποσειδῶν· ἐν δ’ ὁ πορφόρος θεὸς
Τιτὰν Προμηθεὺς[174]

and the scholiast adds that Prometheus was revered in the Academy along with Athene, as Hephaestos was, and a temple was shown in a grove of the goddess, and an ancient pedestal near the entrance, where there was not only an image of Hephaestos, but also one of Prometheus. Prometheus,

however, according to the statement of Lysimachides, was represented as primary and more ancient, and he held in his hand a sceptre; Hephaestos as the younger and in the second place, and the altar on the pedestal was shared by both. Prometheus, then, according to the tale, was not obliged to endure his chastisement for ever, but was released from his fetters by Hercules. In this story of his liberation we come across certain remarkable traits. In other words, Prometheus is delivered from his agony because he informs Zeus of the danger which threatens his empire at the hands of the thirteenth descendant. This descendant is Hercules, to whom, we may add in illustration, Poseidon exclaims in the "Birds" of Aristophanes[175], "he will do himself an injury, if he strike a bargain with reference to the transference of the divine headship, for all that Zeus leaves behind him on his decease will most assuredly take place." And, in fact, Hercules is the only man who passed over into Olympus, became a god after being a man, and stands higher than Prometheus, who remained a Titan. Moreover, the overturning of the old race of tyrants is intimately connected with the name of Hercules and the Heraklidae. The Heraklidae break up the power of the old dynasties and royal houses, in which we may remark the selfish desire of personal aggrandizement and lawlessness no less than disregard for their subjects admitted no judicial restraint, and consequently was responsible for the grossest cruelties. Hercules, though himself in the service of a superior lord, overcame the savagery of this despotism.

In a similar way we may, to linger once more for a moment by the illustrations we adduced on a former page, recall again to our readers the "Eumenides" of Aeschylus. The conflict between Apollo and the Eumenides is to be settled by the intervention of the Areopagus. In other words, a human tribunal, as a whole, at whose head stands Athene, stands forth as the concrete spirit of the folk, and is as such to terminate the collision. The judges, however, give an equal number of votes for

condemnation and acquittal, having an equal reverence both for the Eumenides and Apollo; the white pebble of Athene, however, decides the conflict in favour of Apollo. The Eumenides break out in indignation against this decision of Athene; she, however, allays their wrath by promising them worship and altars in the famous grove of Colonos. What the Eumenides have to give in return to her people is a protection against the evils[176] which result from the elements of *Nature*, the earth, the heavens, the sea, and the winds; they have further to ward off unfruitfulness in the fields, the failure of living seed, and misbirths in all else that is procreated. Pallas, on her part, takes beneath her protection the strife of wars and sacred contests. Ina similar way Sophocles[177], in his "Antigone," not only makes Antigone suffer and die, but to a like extent we find that Kreon is punished by the loss of his wife and the death of Haemon, both of whom perish through the death of Antigone.

(*c*) *Thirdly*, the ancient gods do not merely preserve their place in juxtaposition to the new, but, what is of more importance, the natural basis itself is maintained by the new gods, and receives, continuing to made its echo sound in them, if in conformity with the spiritual individuality of classical art, a reverential acceptance.

(*α*) And for this reason people are not unfrequently led into the error of conceiving the Greek gods, in respect to their human character and form, as mere *allegories* of such natural elements. This is not so. In this sense we frequently hear it stated that Helios is the god of the sun, Diana the goddess of the moon, or Neptune the god of the sea. Such a separation, however, between the natural element, as content, and the humanly shaped personification, as form, no less than the external association of both, regarded merely as the masterdom of the god over the natural fact, as we are accustomed to it in the Old Testament, is quite inapplicable to Greek conceptions. We never find among the Greeks such an expression as ὁ θεὸς

τοῦ ἡλίου, τῆς θαλάσσης, and so forth, though it is quite certain they would have used with others such an expression for the relation in question, had it been compatible with their point of view. Helios is the sun as god.

(*β*) We must, however, at once insist on the further fact that the Greeks never regarded mere Nature as itself divine. On the contrary, they retained the definite conception that what was purely natural was not divine. This is partly contained, if unexpressed, in what their gods actually are, in part also it is expressly stated so by themselves. Plutarch, for example, in his essay upon Isis and Osiris, refers incidentally to the modes of interpretation current of myths and divinities. Osiris and Isis belong to the Egyptian theogony, and had yet more of the natural element for their content than the Greek gods, who correspond to them; they merely express the longing and conflict to escape out of the circle of Nature to that of Spirit. In later times they were very highly honoured in Rome, and the mysteries allied with them were of great importance. Yet for all that it is Plutarch's view that it would be an interpretation beneath the level of the subject to think of explaining them as sun, earth, or water. Only that which in the sun, Earth, and so forth, is without measure or co-ordination, defective or superfluous, can strictly be referred to the natural elements, and all that is good and conformable to order is as exclusively a work of Isis, and the rational principle, the λόγος, a work of Osiris. It is not, therefore, the natural as such which is adduced as the substantive content of these gods, but the spiritual principle, the universal, λόγος, reason, conformity to law.

By virtue of this insight into the spiritual nature of the gods, the more definite elements of Nature, then, had also among the Greeks been differentiated from the later gods. We have, it is true, grown accustomed to associate Helios and Selene, to take two examples, with Apollo and Diana: in Homer, however, they are presented as distinct. The same remark applies to Oceanos and others.

(*γ*) But in the *third* place an echo still lingers in the new gods of the natural powers, whose operative energies themselves belong to the spiritual individuality of the gods. We have already indicated, at an earlier stage, the basis of this positive connection of the spiritual and natural in the ideal of classical art, and may limit our observations here to a few illustrations.

(*αα*) In Poseidon resides, as in Pontus and Oceanus, the might of the world-encircling sea, but his power and activity extends further. He built Ilium and was a shield of Athens. Generally he is revered as the founder of cities, in so far as the sea is the element of sea-faring, of commerce, and a bond between mankind. Apollo, in like manner, is the light of knowledge, of oracular speech, and preserves, moreover, a distant relation with Helios, as the natural light of the sun. Critics differ, no doubt — take Voss and Creuzer for examples — as to whether Apollo is referable to the sun. One may, however, in fact, assert that he both is and is not the sun, since he is not limited to its natural content, but is raised thereby to the significance of a spiritual import. It is impossible to escape the inevitable connection in which knowledge and light, the light of Nature and that of Spirit, if we regard their fundamental characteristics, stand relatively to one another. Light regarded as a element of Nature is that which manifests. Without our seeing Light itself it makes visible to us the illuminated objects around. By means of Light everything grows on the plane of contemplation for something else. Spirit, that is the free light of consciousness, knowledge, and cognition, possesses just the same character of manifestation. The distinction, apart from the differences of the respective spheres, in which these two modes of manifestation reveal themselves, consists simply in this, that Spirit reveals itself, and in that which it brings us, or which it assimilates as content[178], remains constant to itself. Light, however, does not make itself apprehensible to itself, but, on the contrary, makes that which is other and external to itself apprehensible; and though, no doubt, we may say

this is done from its own resources, yet it cannot, as the Spirit can, once more retire into itself. For this reason it does not win the higher unity which finds itself constant by itself in another. Just as, then, light and knowledge are closely associated, we find in Apollo, as spiritual god, still a recollection of the light of the sun. For this reason Homer, for example, ascribes the plague in the camp of the Greeks to Apollo, which, in such a locality is in the summer solstice ascribable to the operation of the sun. We may add that his deadly arrows have unquestionably a symbolical reference to the solar rays. In the external representation it is external signs which more closely determine under what specific interpretation the god shall be mainly accepted.

More particularly when we follow up the origins of the later gods we are able to recognize the natural element, which the gods of the classic ideal retain in themselves. This is a point which Creuzer in particular has made clear. For example, in the conception of Jupiter there are many features which indicate a solar source. The twelve labours of Hercules, the expedition, for example, in which he carries off the apples of the Hesperides, have relation both to the sun and the twelve months. At the root of the conception of Diana we have the distinct suggestion of the mother of Nature, just as the Ephesian Diana, for example, which floats between the old world and the new, has for her fundamental content Nature generally, procreation and nutrition; which latter feature is clearly indicated in a part of her external form, namely the breasts. If we consider the Greek Artemis, on the other hand, the huntress, who slays wild animals, we find that in her humanly beautiful and maiden form and self-continency, this aspect falls entirely into the background, although the half moon and the arrows still distinctly recall to us Selene. To take Aphrodite in the same way, the more we follow her back to her original source in Asia the more she approaches a force of Nature. Once arrived in Greece, the spiritual and more individual

aspect of her grace, charm, and love, passion is more emphasized, albeit here, too, the natural basis is by no means entirely absent. In the same way the productivity of Nature is, no doubt, the original cradle which gives us Ceres. Starting from that we proceed to the spiritual content, whose relations are developed from agriculture, property, etc. The source in Nature of the Muses is the murmur of the spring-water; and Zeus himself may be accepted under one aspect as the universal Power of Nature, and is revered as the Thunderer, as with Homer already thunder is the sign of misfortune or assistance, is, in short, an omen, and as such is relative to that which is human and spiritual. Juno, too, implies a natural association with the firmament of cloud and the heavenly sphere in which the gods move to and fro. So we are told, for example, that Zeus laid Hercules on the breast of Juno, and from the milk which spouted thereout flashed into being the Milky Way.

(*ββ*) Just as, then, in the later gods, from one point of view the universal elements of Nature are dethroned, while from another they are maintained, we have the same process repeated in that which is, more strictly speaking, animal, which we merely regarded in a former passage on the side of its degradation. We are now able to point out a more positive aspect under which such may be considered. Since, however, in the classic gods the symbolic mode of configuration is abolished, and they secure as their content the spirit that is self-luminous, the symbolical *significance* of animals must tend to pass away precisely in proportion as the animal form has taken to itself the right to mingle with the human under a mode naturally alien to it. It will therefore appear merely as a significant attribute, and is established in juxtaposition to the human form of the gods. Thus we find the eagle as attendant on Jupiter, the peacock on Juno, the doves as accompanying Aphrodite, the hound, Anubis, as watch-dog of the lower world, and so forth. If, therefore, there is still a symbolical aspect which

attaches to the ideals of the spiritual gods, yet, if contrasted with the original significance, it will appear of little importance; and the natural significance, if strictly regarded, which previously constituted the essential content, will merely persist as a residue, and mere particular mode of externality, which, on account of its accidental character, more often than not has a grotesque appearance, for the reason that the former significance is no longer there. Inasmuch as the ideal content of these gods is that which partakes of Spirit and humanity, the externality pertinent to them approximates to a *human* contingency and weakness. In this connection we may once more recall to memory the numerous love affairs of Zeus. According to their original symbolic significance, they are related, as we already have seen, to the universal activity of generation, that is, the vitality of Nature. As the love affairs of Zeus, however, which, in so far as his marriage with Here is to be regarded as the permanent and substantive sexual relation, appear in the light of an infidelity towards his spouse, they have the complexion of accidental adventures, and exchange their symbolical sense for unconnected tales which possess the character of purely capricious invention.

With this degradation of the powers which are purely natural and of the animal aspect no less than of the abstract universality of spiritual relations, and with the re-acceptance of the same within the spiritual individuality, permeated and Suffused as it is with Nature, we leave behind us the origins of classical art which are stamped with necessity and are presupposed by its essence, inasmuch as it is on this path that the Ideal evolves itself by its own agency with that which it is according to its notion. This reality of the spiritual gods adequate to its notion carries us on to the genuine Ideals of the classical type of art, which, in contrast to the old *régime* which has been vanquished, represent immortality[179], for mortality generally resides in the incompatibility of the notion to its determinate existence.

[139] *Als eine Unwürdigkeit*. As something unworthy of the full notion of its gods.

[140] That is, the relegation of it to a position of inferiority.

[141] This is the German word. By genius I presume Hegel means "the familiar spirit" of a particular animal. Apparently this rather than "kind." "Iliad," II, 308; XII, 208.

[142] "Odyss." XIV, 414; XXIV, 215.

[143] "Metam." I, vv. 150-243.

[144] "Metam." VI, vv. 440-676.

[145] "Metam." I, vv. 451-567.

[146] *Ibid.*, IX, vv. 454-64.

[147] *Ibid.,* V, v. 302.

[148] *Ibid.*, vv. 319-31.

[149] "Herod." II, 46.

[150] Creuzer, "Symb." I, 477.

[151] That is, the sphere of fauns as a part of Nature.

[152] *Praktisch.* The contrast is between the philosophic contemplation and the world regarded as the sphere of human activity.

[153] By *Umkehr* Hegel probably means a "return" in the direction of the art of the Sublime.

[154] *Einen bestimmten Kreis.* The meaning seems to be that the circle of examples is here a clearly defined and limited one as contrasted with the vagueness of Oriental Pantheism.

[155] "Herod." II, 52.

[156] *War ein entscheidendes Moment.* That is, was part of the oracular reply.

[157] Both wording and punctuation of this sentence are at fault, but I give the sense no doubt intended.

[158] I am not sure what is referred to here by *Telchinen* and *Pätaken.*

[159] *Das Ganze*, means here, I think, the whole of Creation.

[160] That is, took no further active interest in human life.

[161] Politicus ex rec. Bekk. II, 2, p. 283; Steph. 274.

[162] “Protag.” I, 1, pp. 170-4; Steph. 320-3.

[163] I have just above translated *Sitte* with the word “custom,” that is, ethical custom. But the contrast here is, I think, between morality generally (*sittlich*) and juridical right (*Rechtliche*).

[164] The argument of Hegel is ingenious. It must be admitted, however, that in several accounts of Prometheus, notably that of Aeschylus, Zeus is represented as hostile to human progress. And it is rather a strain on the facts to trace, in the case of Ceres, so much that is of an ethical colour to agriculture, and limit the use of fire simply to the crafts of Hephaestos, ignoring, that is to say, its domestic use altogether.

[165] *Der Sittlichkeit.*

[166] *Gehaltvolle.* That is, intrinsically sound and substantial.

[167] “Eum.” vv. 206-9.

[168] Soph., “Ant.” v. 451: ἡ ξὑνοικος τῶν κάτω θεῶν Δἰκη.

[169] *Umgestaltung.* Remodelling, reorganization. Reformation in literal sense.

[170] *Trübe.* “Troubled” perhaps is better.

[171] The Cabeiri were mystic Powers. Aeschylus wrote a drama under this title. The ancients differ greatly as to their origin and nature, Herodotus assumes an Egyptian origin.

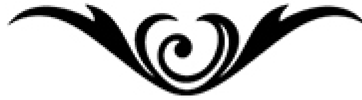
[172] *Feste* is as a substantive a stronghold, and this may be Hegel’s meaning, but I think he uses it here for *Festigkeit*, consistency, compact security.

[173] The sentence is not very clear. The sense is that Prometheus is honoured as the Earth and Sun are honoured by his assistance of human needs.

[174] Vv. 54-6. “This entire spot is sacred; awful Poseidon holds it, and therein is the fire bringing god, the Titan Prometheus.”

[175] Vv. 1645-8.

[176] Vv. 901 *et seq*.



[177] Hegel means that in the suffering of Kleon Sophocles treats the natural law of Antigone and the higher law of the king on the same terms.

[178] Lit., “what is made for it,” *e.g.*, the detail of objective experience.

[179] *Unvergänglichkeit.* Hegel no doubt refers to the epithet always applied by Homer and other, Greek poets to the gods of Olympus, immortal.

CHAPTER II

THE IDEAL OF THE CLASSICAL TYPE OF ART

WE HAVE ALREADY seen what the essence of the Ideal is in our general consideration of the beauty of art. Here we are to take it merely in the special sense appropriate to the *classic* Ideal, whose notion has already presented itself in its general features in its association with the notion of the *classical* art-type. For the Ideal, of which we have now to speak, consists simply in this, that classical art in very truth attains to and sets before us that which exposes its most intimate notion. As content it grasps on this particular plane the spiritual, in so far as this Spirit attracts Nature and her powers to its own appropriate realm, and sets itself before us in exposition not as mere inwardness and dominion over Nature, but furthermore accepts as its proper form, human shape, deed, and action, through which the spiritual shines forth clearly in perfect freedom, and the form penetrates with its life into the sensuous material not merely as into a mode of externality symbolically significant, but as actually into a determinate existence, which is the adequate existence of Spirit.

We may divide up, then, the present chapter into the following sections:

We have in the *first* place to consider the *general* character of the classic Ideal, which possesses what is pertinent to humanity in its form no less than its content, and elaborates both sides in the completest consistency one with the other. *Secondly*, however, forasmuch as here the human is absorbed wholly into the bodily shape and external appearance, it becomes the *definite* external shape, which in its conformity is merely a defined content. Since, therefore, we have the Ideal before us at the same time as

particularity, there arises a definite number of *particular* gods and powers in the shape of human existence. *Thirdly*, this particularity does not persist in the abstraction of *one* type of definition, whose essential character would constitute the entire content and the one-sided principle for its representation; but rather it is quite as much essentially a totality and the *individual* unity and congruity which is applicable to such. Without this repletion such particularity would remain cold and empty; the vitality of Life would fail it, a contingency which is impossible to the Ideal in any relation whatever.

We have now to consider more narrowly the Ideal of classical art according to these three aspects of universality, particularity, and individual singularity.

1. THE IDEAL OF CLASSICAL ART GENERALLY

The questions which arise relatively to the origins of the Greek gods, in so far as the real centre for ideal reproduction results from them, we have already touched upon, and seen that they belong to the elaborated tradition of art. The modification that is incidental to that treatment can only proceed by means of the twofold degradation, on the one hand, of the universal powers of Nature and their personification, and, on the other, of the animal constituents and its form, in order that thereby it may win the spiritual as its true determinate substance, and also the human mode of appearance as its true form.

(*a*) We have described how the classical Ideal first really becomes actual through such a remodelling of that which came before the earliest aspect of it. Along with this we have above all to draw attention to just this fact, that it is generated from mind (Spirit), and consequently has originated in the most intimate and personal resources of the poets and artists, who brought it into the presence of conscious life with the aid of a thoughtful consideration

as clear as it was unfettered and with the distinct object of artistic production. In opposition to this creation we have, however, apparently the fact that Greek mythology reposes on earlier traditions, and contains distinct references to foreign, that is Oriental, matter. Herodotus, for example, although specifically asserting in the passage already cited that Homer and Hesiod created for the Greeks their gods, nevertheless in other passages associates closely these very Greek gods with other divinities such as those of Egypt. For in the second book[180] he expressly narrates that Melampus gave the name of Dionysos to the Greeks, further introduced the Phallus and the entire sacrificial festival, adding, however, this discrepant detail, that Melampus had learnt the religious service from the Tyrian Kadmus and the Phoenicians, who came with Kadmus to Boeotia. These contradictory statements have roused interest in our own times, more particularly as associated with Creuzer's researches, who endeavours to discover in Homer, for example, ancient mysteries and the sources which flowed in together towards Greece, whether they be Asiatic, Pelasgian, Dodonian, Thracian, Samothracian, Phrygian, Indian, Buddhistic, Phoenician, Egyptian, or Orphic, to say nothing of the infinitely varied peculiarities of specific localities and other details. No doubt it appears at first sight wholly inconsistent with these many sources of tradition that those poets should have supplied either the names or the substantial form of the gods. It is possible, however, to harmonize entirely both factors, tradition, and individual creation. The tradition comes first; it is the point of departure, which hands down the mere ingredients; but for all that it does not contribute the real content and the genuine form of the gods. This substantive presence is the product of the genius of those poets, who discovered by a process of free elaboration the true substantive form of these very gods and are consequently in fact become the creators of that mythology which awakes our admiration of Greek art. Yet for this reason

the Homeric gods, in one aspect of them, are not to be taken as the result merely of the poetic phantasy, or nothing more than capricious invention. They have their roots in the genius and beliefs of the Greek folk and the religious basis of that nation. They are the absolute potencies and powers, the highest stretch of the Greek conception, the central point of the beautiful regarded universally, presented, so to speak, by the Muses themselves to the poet.

In this free handling, then, the artist takes up an entirely different position from that he occupies in the East. The Hindoo poets and sages have also to begin with material ready to work upon, such as the elements of Nature, the heavens, animals, streams, and so forth, or the pure abstraction of the formless and contentless Brahman. Their enthusiasm, however, is a confusion of the ideal character[181] of the subjectivity which accepts the difficult task of elaborating such an external material to it, an enthusiasm which, in the unmeasured expansion of its imagination, which excludes every secure and absolute[182] direction, is unable to mould its creations conformably to genuine freedom of expression and beauty, and remains the slave of that material in uncontrolled and roving productive activity. It resembles, in fact, a master-builder who has no firm foundation beneath him. Ancient ruins of half dismantled walls, mounds, and projecting rocks fetter him, quite apart from the particular aims according to which he desires to construct his building; and he can only create a wild, inharmonious, and fantastical fabric. In other words, that which he produces is not the result of his imagination freely acting under its own plastic genius. Conversely the Hebrew poets present us with revelations which, it is said, they deliver as the Lord's voice, so that here again the creative source is an enthusiasm not fully self-conscious; it is separated, that is, and distinct from individuality and the productive genius of the artist, as in the wisdom of the Sublime generally it is the abstract and eternal, essentially in its

relation to something other than it and external, which is consciously or imaginatively conceived.

In classical art artists and poets are, it is true, also prophets and teachers, who declare and reveal to mankind the nature of the Absolute and Divine. But we must emphasize here the following distinctions:

(α) In the *first* place the content of their gods is neither that appearance of Nature which is external to humanity nor the mere abstraction of one Godhead, whereby merely a superficial formulation or an inwardness that is without content is preserved. Their content is, on the contrary, deduced from human life and existence, and for this reason is that which is peculiar to the human breast; a content, in short, with which man himself can freely coalesce as at home with himself, while that which he thus produces is the fairest product of his own activity.

(β) *Secondly*, these artists are at the same time *poets*, that is, men of creative talent who work the aforesaid material and its content into a free and substantially independent form. As thus regarded Greek artists are in all essential respects creative poets. They have brought together all the varied original ingredients into the melting-pot, but they have produced thereby no mere broth, such as might come from a witches' cauldron; rather they did away with all that is troubled, purely natural, unclean, foreign, and without rational measure in the pure flame of this more profound spirit; they made all glow together and permitted the form to appear at last purified, albeit it still retained a distant accord with the ruder material from which it was fashioned. What mainly concerned them in this work consisted partly in the winnowing away of all that was in their inherited material destitute of form and beauty, distorted and symbolical, and partly in the prominence they gave to what was really spiritual, which they set themselves to render under modes of individuality, and in the interest of which they had to discover gradually the external appearance most appropriate. Here for the first time

we find that it is the human form and human actions and events, not merely made use of under the mode of personification, which, as we have already seen, necessarily stand forth as the uniquely adequate reality. No doubt the artist discovers these forms, too, in the real world; but he has at the same time to eradicate all that is accidental and incongruent in them, before they are entitled to appear as commensurable with that humanity, which, as essentially apprehended, shall offer to us the image of the eternal powers and gods. And this is what we call the free and spiritual, and not merely capricious production of the artist.

(*γ*) And, *thirdly*, for the reason that the gods are not merely stable existences in their own world, but also are active within the concrete reality of Nature and human, events, the poet is further concerned to recognize the presence and activity of the gods in this relation to human, fact, to interpret, that is, the particularity of natural event and human actions and destiny wherein the divine powers are apparently interfused, and to share thus the duties of the priest and the seer. We, from the point of view of our everyday prosaic reflection, explain the phenomena of Nature according to universal laws and forces, and interpret the actions of mankind as the product of their subjective intentions and self-proposed aims. The Greek poets, however, have their eyes everywhere directed toward the Divine, and create, by giving to human activities the loftier colour and habit of divine actions, and by means of such interpretation, the various aspects under which the power of the gods is made visible. For a number of such interpretations results in a number of actions, in which we are made aware of the character of this or that god. We have but to open, for example, the Homeric poems, and we shall scarcely meet with a single event of importance which is not more closely elucidated as proceeding from the volition or actual assistance of the gods. These expositions are, in fact, the insight, the independently created belief, the intuitive conceptions of the poet, just as Homer often, too, gives

expression to them in his own name, and in part also places such in the mouth of his characters, whether priest or hero. Quite at the opening of the "Iliad," for example, he has himself explained the pestilence in the Greek camp as the result of the indignation of Apollo over Agamemnon, who refused to release to Chryses his daughters[183]; and, in a passage that follows, he makes Calchas transmit this very interpretation to the Greeks[184].

In a similar way Homer informs us in the concluding canto of the "Odyssey" — on the occasion when Hermes conducted the shades of the inanimate suitors to the meadows of Asphodel, and they find there Achilles and the other deceased heroes, who fought before Troy, and finally, too, Agamemnon joins them — how the last-mentioned describes the death of Achilles[185]:

"The whole day long had the Greeks fought; and when at last Zeus separated the combatants, they carried the noble body to the ships, and washed it, weeping often the while, and embalmed it. Then there arose a divine uproar on the sea, and the affrighted Achaeans would have been flung headlong into their hollow ships, had not an aged and much knowing man, Nestor to wit, restrained them, whose advice had also proved the wisest on former occasion." Nestor then interprets for them the phenomenon in the following terms: "The *mother*[186] comes forth from the sea with the immortal sea-goddesses, in order to meet her deceased son. And the great-hearted Achaeans at this word let their fear depart from them." That is to say, they knew then of what kind it was — of human origin — the mother in her grief comes toward him; what they shall see and hear is that which finds its response in themselves. Achilles is her son, she is herself full of grief. And in this vein Agamemnon, turning towards Achilles, continues his narrative with a description of the universal sorrow: "And around thee stood the daughters of the ancient of the sea, lamenting, and they robed themselves in ambrosial garments; and the Muses also, the

nine in conclave, wailed by turns in beautiful song; and there was I ween no man of the Argives to be seen without tears, so greatly did the clear-toned song move all."

It is, however, another divine apparition in the "Odyssey" which has always in this connection most particularly fascinated me in my study of it. Odysseus in his sea-wanderings, insulted among the Phaeacians during the sports over which Euryalos presides, because he refused to take part in the rival throwing of the discus, makes answer indignantly with dark looks and hard words. He then stands up, seizes a disk, larger and heavier than the rest, and hurls it far and away over the mark. One of the Phaeacians marks down the throw and calls out: "Even a blind man could see the stone; it does not lie within the medley of the rest, but far beyond. Thou hast nothing to fear in this contest; there is no Phaeacian who will reach or surpass such a throw as thine is. So he spake; but the much-enduring divine Odysseus rejoiced to see a well-disposed friend in the lists." And this word, this friendly nod of the Phaeacian Homer interprets as the friendly apparition of Athene.

(*b*) Of what kind, then, we may further ask, are the *products* of this classical mode of artistic activity, of what type are the new gods of Greek art?

(*α*) It is their concentrated individuality which presents to us the most general and at the same time most complete idea of their intrinsic character, in so far, that is, as this individuality is brought together out of the variety of accidental traits, isolated actions, and events into the one focus of their simple and self-exclusive unity.

(*αα*) What appeals to us in these gods is first of all the spiritual and *substantive* individuality, which, withdrawn into itself as it is out of the motley show of the particular medium of necessity, and, the many-purposed

unrest of the finite condition, reposes on its own inviolable universality, as on an eternal and intelligible foundation. It is only thus that the gods appear as the imperishable powers, whose untroubled rule is made visible to us not in the particular event in its evolution with somewhat else and external to it, but freely in its own unchangeableness and intrinsic worth.

(*ββ*) Conversely, however, they are not by any means the bare abstraction of spiritual generalities, and thereby so-called general Ideals, but in so far as they are individuals they appear as one Ideal, an essentially of itself determinate existence, and consequently one that is defined, in other words one that as Spirit possesses *characterization.* Without character we can have no individuality. From this point of view we find, as we have already indicated previously, that there is at the root of these spiritual gods a definite natural force, with which a definite ethical consistency[187] is blended, such as imposes on every particular god distinct bounds to the sphere of his activity. The manifold aspects and traits which are forthcoming by reason of this characterization as particular persons, being in this way concentrated in the point of a true self-identity, constitute the characters of the gods.

(*γγ*) In the true Ideal, however, this definition ought just as little to terminate in the blunt restriction of pure *one sidedness*, but must at the same time appear as withdrawn into the universality of the godhead. In just such a way, then, every god, by carrying in his own person this defined character as divine and as bound up with that as universal individuality, is in part of a definite type, and in part is all in all, and floats, as it were, precisely midway between mere universality and equally abstract singularity. And this is what gives to the genuine Ideal of classical art its infinite security and repose, its untroubled blessedness and unimpaired freedom.

(*β*) Add to this that as beauty of classical art the essentially self-articulate divine character is not only spiritual, but fully as much plastic form which

appears externally in its bodily presence to the eye no less than to the mind.

(*αα*) This beauty, inasmuch as it possesses not merely the natural or animal aspect in its spiritual personification, but includes as its content that which is spiritual in its adequate mode of existence, can only take up what is *symbolical* in its incidental aspect and under those relations in which it appears as purely natural. Its real external expression is the form that is peculiar to mind and only mind, in so far as its ideal character reveals itself as existent truth, and pours itself wholly through that form.

(*ββ*) From another point of view classical beauty is debarred from giving expression to the *Sublime.* For it is only the abstract universal, which attaches to itself no inclusion such as is self-defined, but merely a negative determinacy relatively to particularity in general, and along with this is resolute in its antagonism to every form of embodiment which presents us with the aspect of the Sublime. Classical beauty, on the contrary, carries spiritual individuality into the very heart of what is at the same time its natural existence, and elucidates the ideal content wholly in the material of its external appearance.

(*γγ*) For this very reason, however, it is essential that the external form quite as much as the spiritual, which creates for itself therein its home and dwelling, should be liberated from all dependence on Nature and derangement, all finitude, all that is of fleeting character, all that is exclusively concerned with the sensuous presence, and should purify and exalt that definition of it which discloses affinity with the determinate character of the god into free commerce with the universal forms of the human figure. The stainless externality alone, from which every hint of weakness and relativity has been removed, and every flick of capricious particularity wiped off, is able to represent the Spirit's ideality, which should sink itself in it and secure an embodiment from it.

(*γ*) For the reason, however, that the gods are forced once more from the defined limits of character into the universal wave, the self-subsistency of Spirit as repose on itself, and as the security of itself in its external form has to discover a real reflection also in its manifestation.

(*αα*) Consequently we observe in the concrete individuality of the gods — when we have before us the genuine classic Ideal, on equal terms with all else — this nobility and loftiness of Spirit, in which, despite the entire absorption within the bodily and sensuous presence, we are made conscious of the absolute removal of all the indigence of what is wholly finite. Pure self-absorption[188] and the abstract liberation from every kind of determinacy is the highway to the Ideal of the Sublime. The classical Ideal, on the contrary, is made visible in an existence which entirely is its own, that is, the specific manifestation of Spirit itself; yet for all that we shall find that here, too, the Sublimity of the same is blended with the beauty, and that the one aspect passes over immediately into the other. And this it is which constitutes the expression of loftiness in these figures of the gods, making inevitable the Sublime of classical beauty. An immortal seriousness[189] makes its throne on the forehead of these gods, and is poured forth over their entire presentment.

(*ββ*) In their beauty these gods appear, therefore, as exalted over their individual bodily shape; we have consequently a kind contradiction or contention between their lofty blessedness, which is, in fact, their spiritual self-exclusiveness and their beauty, which pertains to their external bodily presence. Spirit appears wholly lost in its external form, and yet for all that appears quite as much absorbed in itself from out that form. It is precisely as though we had the moving to and fro of an immortal god among mortal men.

In this relation the Greek gods make on us an impression which, despite all difference, resembles that which the bust of Goethe by Rauch made upon

me when I first saw it. Many will have doubtless seen it, the high brow, the powerful, commanding nose, the free eye, the round chin, the affable, finely-cut lips, the pose of the head, so suggestive of genius, with its glance a bit on one side and uplifted: add to this the entire fulness and breadth of an emotional and genial humanity, and further, those carefully articulated muscles of the forehead, of the entire countenance, of all that gives evidence of passion and emotion; and in all this house of Life, the repose, stillness, and loftiness of advanced age; and we may add withal the fading ebb of the lips, which retreat back into the teethless mouth, the slackness of the neck and cheeks, whereby the bridge of the nose appears yet more dominant, and the reach of the forehead yet more towering. The force of this firmly set figure, which to an extraordinary degree brings before us the notion of immutability, appears all the more so in the loose environment which surrounds it[190], just as the sublime head and form of the Oriental in his wide turban, but flapping over-garment and trailing slippers. It is the secure, powerful, timeless spirit, which, in the mask of encircling mortality, is just ready to let this husk fall away, and yet suffers it to linger around it freely and without restraint.

In much the same way the gods appear to us in their aspect of lofty freedom and spiritual repose to be exalted over their bodily presence, so that they seem to feel their form, their limbs, despite all the beauty that is there, as at the same time a superfluous appanage. And yet withal the entire presentment is suffused with vitality, identical with their spiritual being, inseparable, without the disunion of what is essentially subsistent, and those parts which are more loosely put together, the spirit in short neither escaping nor coming forth from the body, but both firmly moulded together into a whole, out of which, and in no other way, the self-absorption of Spirit looks forth in silence in its amazing and secure self-possession.

(*γγ*) For the reason, then, that the contention we have indicated is present, without appearing, however, as a difference or separation of the ideal spirituality from its external form, the negative which is therein contained, is for this very reason immanent in this inseparable totality and is thereby expressed. This is within the sphere of this spiritual loftiness the breath and atmosphere of melancholy, which men of genius have felt in the godlike figures of antique art even where the beauty of the external presentment is consummate. The repose of divine blessedness[191] is unable to split itself up into the passions of joy, pleasure, and satisfaction, and the *peace* of immortality stands aloof from the smile of self-satisfaction and genial contentedness. Contentment is the emotion of the agreement of our singular subjectivity with the condition of that environment which is defined for or given to us or brought about through our own agency. Napoleon, for example, never expressed more thorough contentment than when he happened to obtain some success at the cost of making all the world discontented. For contentment is only the approval of my own being, action, and engagements, and the extreme of it is readily recognizable in that state of feeling of the Philistine to which every man of practical ability necessarily extends it. This feeling and its expression is, however, no expression appropriate to the prefigured immortal gods. Free and perfected beauty is not satisfied with joining the concordant temper of a particular finite existence; rather its individuality, in its aspect as Spirit no less than in that of form, albeit it is self-defined with characterization, only finds itself fully in union with its true nature when it is at the same time free universality and spirituality in repose upon itself. This universality is just that which people are wont to point to as the frigidity of the Greek gods. They are only cold, however, to our modern intimacy with the temporal. Independently regarded they possess warmth and life; that peaceful blessedness, which is reflected in their external presentment, is essentially

an abstraction from particularity, a mode of being indifferent to the Past, a surrender of that which is external, a giving up which, albeit neither full of trouble nor pain, is for all that a giving up of what is earthly and evanescent, just as their cheerfulness of spirit looks far away and over death, the grave, loss and temporality, and for the very reason that it is profound inherently contains this negative we are discussing. And the more this earnestness and spiritual freedom is prominent in the vision of these godlike figures the more we feel the contrast between this loftiness and the determinate corporality in which they are enclosed. The blessed gods mourn quite as much over their blessedness as their bodily environment. In the letters of their form we read the destiny which lies before them, and whose development, as actual manifestation of that contradiction between this very loftiness and that particularity, spirituality, and sensuous existence classical art itself sets face to face with its final overthrow.

(*c*) If we ask ourselves, then, *thirdly*, what is the nature of the external representation, which is adequate to this notion of the classic Ideal we have just indicated, we shall find in this connection, too, that the essential points of view have already in our general consideration of the Ideal been furnished us with considerable detail. We have consequently here only further to remark, that in the genuine classic Ideal the spiritual individuality of the gods is not conceived in their relation to something else, or brought about by virtue of their particularity in conflict, and battle, but rather is made visible in their eternal self-tranquillity, in this painfulness of the godlike peace itself. The determinate character is not, therefore, made active in the way that it stimulated the gods to the sense of particular emotions and passions, or compelled them to adopt specific aims of conduct. On the contrary, it is precisely out of that collision and development, nay, out of that very relation to the finite and all that is essentially discordant that they are brought back to that condition of pure

self-absorption. This repose in its most austere severity, not inflexible, cold, or dead, but sensitive and immutable, is the highest and most adequate form of representation for the classic gods. When they make their appearance consequently in specific situations, it is not necessary that there should be conditions or actions which give rise to conflicts, but rather such which, as themselves harmless, so, too, leave the gods in a like condition. It is, therefore, sculpture which among the arts is above all adapted to portray the classic Ideal in its simple self-possession, in which what is rather the universal divinity receives more obvious emphasis than the particular character. Chiefly it is the more ancient and more austere type of sculpture which maintains its firm hold of this aspect of the Ideal, and only in the later forms we find a movement towards increased dramatic vividness of situations and characterization. Poetry, on the contrary, ranges the gods in vigorous action, that is, in an attitude of negation to a definite mode of life, and brings them thereby into conflict and strife. The repose of plastic art, where it remains in the sphere which is uniquely its own, can only express the aforesaid negative phase of spirit face to face with particular facts in that serious strain of melancholy, which we have already attempted to define more nearly.

2. THE SPHERE OF THE PARTICULAR GODS

As individuality in visible form, represented under the mode of immediate existence, and withal both definite and particular, godhead necessarily is divided into a number of figures. In other words, Polytheism is unquestionably essential as the principle of classical art, and it would be the undertaking of a fool to think of embodying the one God of the Sublime and of Pantheism or the absolute religion, which comprehends God purely as Spirit and essential personality, in the plastic type of beauty, or to entertain the idea that the classical forms could have arisen among the Jews,

Mohammedans, or Christians, as adapted to the content of their religious beliefs, from their own original views of the world, as they did in the case of the Greeks.

(*a*) In this multiplicity the divine universe[192] at this stage is broken up into a sphere of particular gods, of which each individual stands by himself alone in contrast to all the others. These individualities are not, however, of the kind that they can be taken merely as allegorical presentations of universal qualities, as if Apollo, for example, were the god of wisdom, Zeus of dominion. Zeus is also quite as much wisdom, and in the "Eumenides" Apollo, as we have seen, protects Orestes, the son and the royal son to boot, whom he himself has stimulated to an act of vengeance. The sphere of the Greek gods is a multiplicity of individuals, of which every particular god, albeit also in the specific character of a particular person, is at the same time a self-exclusive totality, which itself possesses essentially also the quality of another god. For every such presentment, viewed as divine, is always, too, a whole. It is only by this means that the divine personalities of Greek religion include an abundance of traits; and although their blessedness consists in their universal and spiritual self-repose no less than in their abstraction from the direct movement which Time is for ever defeating in the sphere of the disintegrating manifold of natural fact and condition, yet for all that they possess the power in a like degree to assert themselves as energetic and active in many of its aspects. They are neither the abstract particular nor the abstract universal, but the universal which is the source of particularity.

(*b*) On account of this type of individuality, however, Greek polytheism is unable to make up an essentially systematic and self-integrated totality. At the first glance, it is true, it appears imperative to require of the Olympus of the gods, that the numerous gods that are there assembled, should, as thus collected together, and if their separable unities have real truth in them, and

their content is to be classic in the true sense, also express essentially the totality of the Idea, should exhaust the entire sphere of the necessary forces of Nature and Spirit, and give to themselves therefore constructive completeness, in other words, manifest themselves as subject to a principle of necessity. This demand, however, would be liable from the first to the qualification that those forces present in the emotions and, generally speaking, assertive in the sphere of spiritual life in the absolute significance[193] which becomes operative first in the later and higher religion, must remain excluded from the sphere of the classic gods, so that the range of content, the particular aspects of which succeed in making an appearance in Greek mythology, would be already thereby curtailed. Moreover, apart from this, we have also on the one hand, necessarily introduced by virtue of the essentially varied character of this individuality, the accidental incidents of a definition, which avoids the rigorous articulation of the differences inherent in the notion, and does not suffer these divinities to maintain the abstraction of merely *one* mode of determination. And, on the other hand, the universality, in the elemental medium of which the divine personalities secure their blessed state, abolishes any hard and fast particularity, and the loftiness of the eternal powers exalts itself jubilant over the cold seriousness of finite fact, wherein, if this inconsequence did not prevail, the divine presences would be evolved through the medium of their limitations.

However much, therefore, even the principal forces of the world, as the totality of Nature and Spirit, are reproduced in Greek mythology, this aggregation, quite as much in the interests of the universal Divine as in those of the individuality of particular gods, cannot assert itself as a *systematic* whole. If this were not so, instead of *individual* characters the gods would approximate rather to allegorical beings, and instead of being

divine personalities would be characters wholly limited to finite and abstract modes.

(*c*) When we consequently consider the circle of the Greek divinities — that is all within the range of the so-called presiding divinities — more nearly according to their fundamental character, inquiring how that character appears firmly delineated by sculpture in its most general and at the same time sensuously concrete presentment, we find no doubt the essential distinctions and their totality explicitly set before us, but also in their detail also ever again obliterated, and the severity of the execution tempered to a result which is inconsistent with either their beauty or their individuality. So for example Zeus bears in his hands the dominion over gods and men, without, however, thereby essentially endangering the free independence of the other gods. He is the supreme god; his power, however, does not absorb that of the others. We find in the conception of him no doubt an association with the heavens, with lightning and thunder, and the generative vitality of Nature; but he is yet more truly the might of the State, of the order of fact which is conformable to law, the binding nexus in contracts, oaths, and hospitality, and generally the substantial bond that gives subsistence to the human condition, whether in its practical or ethical aspect, the potency, in short, both of knowledge and spirit. The dominion of his brothers is directed toward the sea or the lower world. Apollo is known as the god of knowledge, as the mouthpiece and fair presentment of spiritual interests, as the teacher of the Muses. "Know thyself" is the inscription over his temple at Delphi, a behest which is not so much concerned with the failings and defects, as the essential import of spirit, that is with art and the truth of consciousness. Subtlety and eloquence, mediation in fact generally as we also find it in subordinate spheres, which, albeit immoral elements are therein commingled, nevertheless are appurtenant to the complete range of spiritual life — such is the most

important province of the activity of Hermes, who also leads the shades of the dead to the underworld. The might of war is what mainly distinguishes Ares. Hephaestos is conspicuously capable in the technical crafts. The enthusiasm which still carries with it a natural element, the strong emotions which wine, sport, and dramatic performances naturally produce are the native province of Dionysos. The spheres allotted to the feminine divinities very much correspond to the above series. In Here the ethical bond of marriage is the most dominant trait. Ceres is the instructress and developer of agriculture, and as such has presented mankind with both those adjuncts to its cultivation, that is to say, first, the care for the nurture of natural products, which satisfy man's immediate wants, and, secondly, the spiritual accessories of property, marriage, right, the beginnings of civilization and moral order. In the same way Athene is the representative of moderation, good sense[194], legality, the power of wisdom, technical capacity in the arts and courageousness, and comprises within her intelligent and warlike maidenhood the concrete spirit of the folk, the free and substantive spirit which uniquely belongs to the Athenian state, and places the same before us in positive shape as sovereign and godlike power to be revered. Artemis on the contrary, wholly distinct from the Ephesian Diana, possesses the more inflexible independence of maiden modesty for her most essential characteristic. She loves the chase, and is generally not so much the quietly pensive, as the severe and eager-striving maiden. Aphrodite, together with the charming Cupid, who in his descent from the ancient Titan Eros became a boy, is the interpreter of all that the attractions and sexual passion effect in our humanity. This, then, is the kind of content of the spiritually informed individual gods. In so far as we are concerned with their external representation we can only repeat that sculpture is the most important art in this respect, and it is carried to the point of this detail of their particularity. If, however, it is permitted to express that individuality in its more specific

determination, it at once passes beyond its primary severe loftiness, although even in that case it unites the variety and wealth of such individuality under *one* mode of definition, namely that which we distinguish as character, and establishes this character in its more simple clarity for the envisagement of the senses, in other words for the completest and most final determination of the external presentment of these divinities. For the imagination always remains relatively to the external and real existence less distinct, when it elaborates, as it also does, as poetry the same content in a number of tales, occurrences, and events which concern the gods. For this reason sculpture is on the one hand more ideal, while on the other it individualizes the character of the gods in perfectly clear human outlines, and perfects the anthropomorphism of the classic Ideal. As this presentation of the Ideal in its mode of externality, entirely adequate as it unquestionably is to the essentially ideal content it declares, these figures of Greek sculpture are the Ideals in their absolutely explicit realization; they are the self-subsistent, eternal forms, the centre of the plastic beauty of classical art, whose type persists as the foundation, even there too, where these figures step forth on the planes of definite activity, and appear as affected by the revolutions of particular events.

3. THE PARTICULAR INDIVIDUALITY OF THE GODS

Individuality and its representation is, however, unable to acquiesce in that which is still an ever relative and abstract articulation of character. A star is exhaustively summarized in the simple laws that control it. A few definite traits may sufficiently characterize the external formation of the world of rocks; but already in the vegetable world we are aware of an infinite variety of manifold structure, transition, interfusion, and anomaly. Animal organizations are distinguished by a still greater range of difference, and constantly shifting interaction with the external environment to which they

are related. And finally, as we rise to the spiritual realm and its manifestation, we are conscious of a yet more infinitely embracing multiplicity, both of its internal and external existence. Inasmuch, then, as the classic Ideal does not rest content with purely self-possessed individuality, but is further concerned to place the same in motion, to bring the same into relation with something else, and to exhibit it as active in such relation — for these reasons the character of the gods does not rest stationary in the possession of what itself is an essentially still substantive determination, but secures further particular traits of wider extension. The self-exclusive movement in the direction of external existence, and the change which is inseparable from it supplies the more intimate traits that constitute the singularity of any particular god, as is meet and fit and withal necessary to complete a living personality. The accidental nature of these particular traits is, however, associated at the same time with such a type of *singularity*, traits, that is, we are no longer able to refer back to the universal aspect of the substantive significance. For this reason this particular aspect of the separate divinities approximates to something positive, which can consequently also merely stand about it and continue to resound as an external accessory.

(*a*) We are therefore at once confronted with the question: "From what source is the *material* secured for this mode of the appearance of singularity, and in what manner is this forward process of particularization maintained?" For the ordinary individual man, for his character out of which he brings his actions to a conclusion, for the events in which he is involved, for the destiny which awaits him, this closest and more positive material is supplied by his external conditions, such as the date of his birth, the situation he inherits, parents, education, environment, temporal relations, the entire province, that is, of the conditions of his life as they affect his spiritual nature or bodily existence. The present world contains

this material, and the records of life furnished by different individuals are from this point of view characterized by every conceivable difference. It is another matter altogether, however, with the free shapes of godlike individuality, which possess no determinate existence in the concrete world of Nature, but have their birth in the cradle of the imagination. For this very reason it is an obvious assumption that poets and artists, who, speaking in general terms, have created the Ideal out of their free spiritual bounty, have merely borrowed the material for these accidental particular traits from the caprice of their own innate powers of imagination. This assumption is, however, false. For we assigned in general terms to classical art, the position that its construction in the first instance is, by means of the reaction active in its opposition to the assumptions necessarily requisite to its own peculiar province, carried forward to that which as genuine Ideal it is. It is from these presuppositions as their source that the specific traits of particularity are to be looked for, which supply to the gods their closer individual vitality. The fundamental features of these assumptions have already been submitted, and we have only here to remind our readers shortly of what has been already advanced.

(α) It is the symbolical natural religions which constitute in the first instance the abundant source which supplies Greek mythology with the primary substratum that we find then modified within it. But inasmuch as the traits that are borrowed from such a source have to be distributed among gods that are represented as individuals possessing the life of Spirit, they inevitably lose the essential feature of their character, in which they passed as symbolical; they have now no longer to retain a significance, which would differ from that which the individual himself presents and makes visible. The previous symbolical content becomes now, therefore, converted into the content of a divine subject itself, and for the reason that it implies no substantive relation of the god, but is merely an incidental feature,

material of this sort falls together into an external tale, some deed or event, which is ascribed to the gods in this or that particular situation. Consequently we find under this head all the symbolical traditions of the earlier sacred poems, which receive, under the modified shape of actions proper to a truly self-conscious individuality, the form of human events and histories, which purport to be accomplished in concert with the gods, and are not merely the inventions of poets as the mood dictates. When Homer tells us, for instance, that the gods went off on a journey to feast for twelve days among the blameless Ethiopians, such would be a poor enough example of inventiveness regarded as the poet's invention alone. It is much the same with the tale of the birth of Zeus. Kronos, we are told, had devoured all his sons; for this reason Rhea, his spouse, when she was big with her youngest child Zeus, went off to Crete, where she brought forth her son, presenting to Kronos a stone to devour instead of her child, whom she swaddled in fur. Later on Kronos brought up again all his children, his daughters, and along with them Poseidon. This story, regarded as mere invention, would be foolish enough. The remnants of symbolical significance still peer, however, through it, albeit on account of their having lost their original character, they come down to us in the guise of external history. The history of Ceres and Proserpina is on similar lines. Here we have the ancient symbolic significance of the disappearance and budding forth of the seed of corn. The myth presents this to us under the image as though Proserpina played one day in a valley with flowers, and plucked the fragrant narcissus, which from one root opened in a hundred blossoms. Then the Earth thunders; Pluto ascends from the depths, lifts the lamenting maiden into his golden car, and bears her off to the underworld. Thereon Ceres wandered over the Earth for a long time vainly stricken with a mother's sorrow. Finally Proserpina returned to the upper world; Zeus, however, had only suffered her to do this subject to the command that she

must never partake of the food of the gods. Unfortunately she had on one occasion tasted a pomegranate, and was therefore only able to remain in the upper world during spring and summer. In this tale, too, we find that the symbolical content has not been retained, but has been converted into a human event, which suffers only the more general sense to penetrate through many external traits. In the same way the supplementary names of the gods point frequently to symbolical ground-strata of a similar character, from which, however, the symbolical form has vanished, and which only serve now to give individuality a more complete characterization.

(*β*) Local conditions supply a further source for the positive particularities of individual divinities, no less by presenting us with the origin of the conceptions of godhead, than by pointing to the modes under which their services were originally obtained and secured, and the particular places which were in a special sense devoted to their worship.

(*αα*) Although, however, the demonstration of the Ideal and its universal beauty is exalted over the particular locality and its unique claims for recognition, and, moreover, has drawn together the specific external aspects in the more general range of the artistic imagination into one comprehensive picture which is throughout adequate to the substantive significance, yet for all that, when the art of sculpture associates the gods, regarded as individuals, with isolated relations and conditions, these particular traits and local colours come frequently also to the fore, in order to reproduce something of that individuality, although it is only thus more defined in its external aspect. An illustration of this is the way Pausanias adduces a mass of ideas, images, pictures, and myths, which he met with in temples, public places, temple treasuries, in any place where anything of importance was to be found or otherwise was in the range of his experience. In the same way and on the same lines the ancient traditions and local

suggestions which have been borrowed from foreign sources run along with the home ones in Greek myth; and to all of them more or less a relation has been attached which unites them to the history, creation, and foundations of States, more particularly by means of colonization. Forasmuch, however, as this many-sided and specific material in the universality of the gods has lost its original significance, we necessarily come across stories, which in their motley and intricate character fail to convey any meaning whatever. As an example we may instance the case where Aeschylus in his "Prometheus" presents to us the wanderings of Io in all their severity and external garb without admitting the least suggestion of an ethical or traditional story, or a natural significance. We find just the same difficulty when we approach the stories of Perseus, Dionysos, and others. The most varied and confused kind of material is also run into the tales about Hercules, which forthwith, in such tales, assume an entirely human aspect under the guise of chance events, exploits, passions, misfortunes, and other untoward occurrences.

(*ββ*) In addition to all this the eternal powers of classical art are the universal constituents of the actual embodiment of the existence and actions of Greek *humanity*, from whose national origins consequently in their earliest form, that is, out of the heroic times and other traditions, still a very considerable residue of detail remains appendant to the gods even in later days. In this way, too, many characteristic features in the intricate tales of their gods unquestionably must be referred to historic personages, heroes, older folk-races, natural facts and circumstances attributable to wars, battles, and other matters of a public character. And just as the family and the distinction of clans is the point of departure of the State, the Greeks possessed also their family gods, penates, clan-gods, and furthermore the guardian divinities of particular cities and states. In this excessive leaning towards the point of view of history the thesis, however, is apt to be maintained that the origin of the Greek gods generally is deducible from

such historical facts, heroes, and earlier kings. This is a plausible but none the less superficial view. Heyne quite in recent times has also given currency to it. In a way analogous to this a Frenchman, by name Nicholas Fréret, has, for example, accepted the quarrels of different priestly guilds as the general principle underlying the war of the gods. That such a historical phase in the life of a people may contribute something, that definite clans may have given some effect to their peculiar notions of deity, that likewise different local aspects may have afforded further matter in the process of divine individualization — all this may be admitted, no doubt. The real origin of the gods is for all that not to be traced to such external material of history, but resides in the spiritual potencies of Life, under the guise of which they were conceived. We are consequently only entitled to accept the more extensive play of all that is positive, local, and historical, in so far as it makes more definite the formal presentation of each particular individuality.

(*γγ*) Inasmuch as, further, the god passes into the sphere of the human imagination, and, still more important, is represented in real bodily shape, into close relations with which again man is placed by his *cultus* in the activities of divine worship, a fresh material is here, too, presented by such relations for the extension of all that is positive and accidental. What animals have to be sacrificed to any god, what vestments the priesthood or the worshipper must appear in, what particular sequence must be adopted in any ceremonial — by all such matters the most varied and particular incidents are accumulated. For every activity of this kind implies an indefinite number of aspects and modes of arrangement, which may accidentally fall out in this way or that, but which, as appurtenant to a sacred rite, should be something settled, and not fixed by caprice, and which necessarily tend to pass into the sphere of symbolism. The colour of the vestments is an example of this; in the ritual of Bacchus we have the colour of wine, in like manner the doe-skin in which those initiated in the

mysteries were enwrapped. The same thing applies to the drapery and attributes of the gods, the bow of Pythian Apollo, the whip, the staff, and numberless other accessories. Such things become, however, gradually a custom and nothing more; no one in the practice of the same thinks any longer of their birth history; and all that we now by dint of our research point out as their significance, has in the performance of them grown to something quite external, which mankind associates himself with on account of the immediate interest, that is, from mere sense of fun, delight in the present, devotion, or simply because it is just a custom and is so fixed for his active senses, and is done in like manner by others. As an example from our own life, when we see our German youth light the Johannis fire in summer time, or play antics elsewhere, and throw it at the windows, such is for us a purely formal custom, in which the original significance fades as much into the background as at the festal dances of Greek youths and maidens the revolutions of the dance do in their imitative (like the twists and turns of some labyrinth) significance of the spiral motions of the planets. Youth does not dance in order to entertain ideas of such things, but the interest limits itself naturally to the dancing and the tasteful and graceful festivity of its beautiful motion. The entire significance, which was created by the original stimulus, and of which the reproduction was for the imagination and sensuous perception of symbolical character, is throughout an imaginative conception, whose singular traits we suffer to pass from us like a fairy story, or as in historical narrative as external detail relative to Time and Space, and of which we can only say: “It is so,” or, “Such is the tale,” and so forth. The interest of art can consequently only consist in this, namely, that it borrow one aspect from the material which has passed into the condition of positive externality, and make the best of this one for an example, which sets the gods before us as concrete, living individuals, merely retaining a distant echo of any profounder significance.

This positive aspect is precisely that which endows the Greek gods with the charm of living humanity when the imagination elaborates it anew. It is by this latter process that what is otherwise merely of substantive import, or that of power, is thereby carried into the individual present, which, speaking in general terms, is concentrated to a point out of that which is truly explicit or independently actual, and which is external and accidental, and thereby the indefinite, which otherwise is always present in the conception of the gods, is limited in its range and filled out in its content. We are unable to attach any additional value to specific tales and particular traits of characterization, for this material, which, in its earlier stage is, when we look at its primary source, the symbolically significant, has now only remaining the task to perfect the spiritual individuality of the gods in their positive sensuous definition in contrast to the human and to attach to it by virtue of a material which, in respect to its content and envisagement, is undivine, the aspect of caprice and chance, characteristics inseparable from concrete individuality. Sculpture, in so far as it presents to our senses the pure ideals of the gods, and is concerned to set before us character and expression solely under the mode of living bodies, can least of all with clearness make visible the final result of individualization. It does nevertheless give real effect to it within the limits of its own province, as we may see, for example, in the different treatment of headdress, the mode in which the folds or locks of hair are arranged in each particular case; and this is done not merely with a view to symbolical interpretation but in order to individualize. In this way Hercules has short locks, Zeus an abundant growth which rises above the forehead, Diana quite a different folding of the hair to that of Venus. Pallas, too, is distinguished by the Gorgo on the helmet, and the like result is obtained by means of weapons, girdle, fillets, bracelets, and all the variety of other external adornment.

(*γ*) We find as a *third* and final source of the closer definition of divine personality the relation which this occupies to the concrete actual world and its numerous natural phenomena, human deeds and events. For however much we have seen that this spiritual individuality is in part respectively to their universal essence, and partly in respect to their particular singularity, the visible result of earlier natural foundations which have symbolical significance, yet it also persists, if regarded as a spiritually self-subsistent personality, in a relation of continuous, vitality with Nature and human existence. It is under this point of view, as we have already intimated at length, that we have before us the imaginative flow of the poet, an ever fertile source of particular tales, traits of character and exploits, such as are related us about the gods. The artistic aspect of this stage of the process consists in this, that the divine personalities are made to blend in a vital way with human affairs, and that the isolated nature of events are without exception conceived in association with the universality of the divine, just as we ourselves, for example, are wont to say, if in another sense, of course, that this or that eventuality comes from God. Even in the reality of everyday life, in the natural process of his existence, in his daily wants, fears, and hopes, the Greek took refuge in his gods. At first it was external accidents, which the priesthood accepted as omens, and interpreted relatively to his objects and circumstances. If distress and misfortune appeared, the priest had to explain the cause of the affliction, to recognize the anger and disposition of the gods, and to suggest the means by which the misfortune might be faced. The poets proceed yet further in their interpretations for this reason, namely, that they ascribe everything, which is related to a pathos universal and essential, that is, the moving force in human resolve and action, to the gods themselves and their activity; so that the activity of mankind appears likewise as the act of the gods, who fulfil their own counsels by means of their instrument, man. The material in these poetical

expositions is taken from the circumstances of ordinary life, in respect to which the poet lays it down, whether this or that god has expressed his purpose in the event which he is expounding and asserted himself actively therein. For this reason poetry to an exceptional extent enlarges the range of many specific stories, which have the gods for their principal subject-matter. We may in this connection recall to our memories several examples which we have already used as illustrations when considering another aspect of our subject, namely, the relation of the universal powers to the practical pursuits of human personality. Homer places Achilles before us as the bravest among the Greeks before Troy. This pre-eminence of his hero he expresses by means of the statement that Achilles is invulnerable in every portion of his body with the single exception of his heel, which his mother was compelled to take hold of when she dipped him in the Styx. This tale has its origin in the imagination of the poet who thus interprets the external fact. If we accept this bluntly as though an actual fact purported to be expressed therein which the ancients would have believed in the same sense that we believe in any fact on the evidence of our senses such a conclusion is a very crude one indeed. It in short amounts to this, that Homer no less than all the Greeks and Alexander with them who admired Achilles and praised his fortunes, which were the main theme of the song of Homer, were simpletons. Such a glorification must inevitably carry such a consequence if the reflection is to hold good that the bravery of Achilles was no difficult matter since he was aware of his invulnerability. But the bravery is, in truth, thereby in no way abridged, because he is equally aware of his early death, and notwithstanding never evades danger, however it may arise. The like relation is put before us in a very different way in the "Niebelungenlied." In that the horned Siegfried is likewise invulnerable, but he has also in addition to this his cap which makes him invisible. When he assists King Gunther thus invisible in the fight of the latter with Brunhilde it

becomes simply an affair of barbaric sorcery which does not enhance very much our opinion either of the bravery of Siegfried or King Gunther. No doubt in Homer the gods frequently lend assistance to particular heroes; but the gods merely appear on such occasions as the universal concept of that which man as an individual himself is and carries out, and to carry out which he must actively employ the entire strength of his heroic endowment. If it had been otherwise the gods would have only found it necessary to decimate *en masse* the Trojan host in battle in order to complete at once the triumph of the Greeks. Homer gives us a picture just the reverse of this when he describes the main fight as essentially a contest between individuals, and it is only when the press and medley in general, when the entire mass of combatants, the collective heart of the host clashes in fury, that Ares at length storms over the field and gods war against gods. And this is not only generally fine and splendid as an enhancement of the effect, but we may find in it the profounder significance that Homer recognizes the particular heroes in what is singular and exceptional and the universal potencies and forces in the collective effect and the general aspect. In another connection Homer permits Apollo to appear on the scene, when the moment arrives which is fatal to Patroclus who is bearing the invincible armour of Achilles[195]. Three times had Patroclus plunged into the crowded host of the Trojans, mighty as Ares, and three times he had already slain nine men. When he stormed there for the fourth time then it was that the god, enveloped in obscure night, made toward him among the medley and smote him on the back and the shoulders, tore away from him his helmet, so that it rolled on the ground, and rang out sharply as it struck the hoofs of the chargers; and the plumes of it were besmirched with blood and dust, which none ever wot of before. Apollo also breaks the brazen spear in his hands, the shield drops from his shoulders, and his armour is loosened on him by the god. This interference of Apollo we may accept as the poetic

explanation of the circumstance, that it is exhaustion no less than natural death which seizes upon and subdues Patroclus in the turmoil and heat of battle at the fourth encounter. Then it was that Euphorbus was able to thrust his spear into his back between the shoulders. Yet one more time Patroclus endeavoured to withdraw from the battle; but Hector had already hastened to meet him, and thrust his spear deep into his side. Then Hector rejoiced and mocked the sinking hero. But Patroclus, speaking in low tones, replied that it was Zeus and Apollo who had mastered him, and withal with no trouble, because they had taken his weapons from off his shoulders. "Twenty men such as thou art," he exclaims, "I could have laid low with my spear, but I am slain by fateful necessity and the hand of Apollo. Thou, Euphorbus, hast but slain me the second time, and thou, Hector, but the third." Here, too, we may remark that the appearance of the gods simply points to the fact that Patroclus, albeit protected by the armour of Achilles, becomes faint, confounded, and despite of it slain. And this is not by any means a superstitious freak or empty play of the imagination, or rather a statement which amounts to this[196], that Hector's fame will be detracted from by this interposition of Apollo, and that even Apollo does not play in the entire affair a part which entirely redounds to his honour, since we necessarily take into account the might of the god — speculations of this kind merely betray a superstition of the prosaic mind as destitute of taste as it is devoid of reason. For in every case where Homer explains specific events by means of such appearances of the gods the gods use that which is already immanent in the conscious life of men, the power, that is, of their own passion and observation, or the potentialities of the general condition in which the man is placed, the force and the foundation of that which befalls and happens to anyone as a consequence of such conditions If it is true that at times traits that are wholly external and absolutely positive assert themselves in the appearance of the gods these in their turn have a

comic aspect; as in the case when the lame Hephaestos goes round as cup-bearer. And generally we may say that Homer never treats the reality of such appearances from first to last seriously. At one time we see the gods in action, at another they occupy a station of complete tranquillity. The Greeks were fully conscious that it was the poets who were responsible for such apparitions; and if they believed in them their belief was connected directly with that spiritual aspect which is equally the possession of mankind, forasmuch as it is the universal, the very active and motive principle in the events thus presented. From whatever point of view, therefore, we consider the matter it is clear that it is totally unnecessary to import superstition either in our own views or in those of the Greeks before we can enjoy such poetical representations of their gods.

(*b*) Such, then, is the general character of the classical Ideal, whose broader development we shall have to consider more succinctly when we examine the particular arts. Here we have only to add the observation that to whatever extent either gods or men are carried in their positive opposition to the particular and external, yet in classical art the affirmative ethical substratum must assert itself as maintained. The subjectivity remains throughout in union with the substantive content of its powers. Just as in Greek art the natural element is preserved in harmony with the spiritual and is likewise subordinated to the ideal content, though it be as adequate existence, the inward heart of our humanity ever presents itself also in a thorough identity with the genuine objectivity of Spirit, in other words, with the essential content of what is moral and true. Regarded from this point of view, the classic Ideal is unaware of the separation of ideality from external presentment and of the rending of the subjective and consequently abstract individual caprice in its various objects and passions, and it is no less so, on the other hand, of the abstract universal as thereby created. The foundations of character must, consequently, always be the substantive, and what is bad,

sinful and evil in the self-housed dwelling of subjectivity is excluded from classical representations. And above all else the harshness, wickedness, meanness, and hideousness which finds a place in romantic art, will be wholly alien to it. It is true, we find many instances of transgression, matricide, patricide and other crimes against the love of family and piety treated as the subject-matter of Greek art; but they are not here regarded simply as atrocities, or, as a little while since it was the fashion among ourselves, as brought about by the inscrutability of a so-called fatality which imports the appearance of a necessary result. Rather, if such transgressions are committed by mankind and in part ordered and defended by the gods themselves, such actions are on every occasion presented to us from some point of view at least in a light which declares a certain justification truly arising out of the subject-matter itself.

(*c*) Despite this substantive foundation we have seen the general elaboration of the gods of classical art manifest itself out of the repose of the Ideal within the variety of the individual and external embodiment, in all the detail of events, occurrences, and actions, which become ever and ever more human. By this means classical art finally, if we consider its content, carries yet further the process of *articulating* the accidental individualization, when we consider it as a mode of making the same *pleasurable* and attractive. In other words that which pleases is the elaboration of the particular aspect of the external phenomenon at every point of the same; by this means the work of art no longer arrests the spectator merely in its connection with his own concrete soul-life, but also contains many affiliating links with the finite aspect of his subjectivity. For it is precisely in the finiteness of the art-creation that the closer association subsists with that aspect of the individual which is itself finite, and which rediscovers itself once more with satisfaction in every respect as mobile and stable existence in the art-product. The seriousness of the gods becomes a

grace, which does not agitate with violence or lift a man over his ordinary existence, but suffers him to persist there tranquil, and simply claims to bring him content. Just as we generally find that the imagination when it masters religious conceptions, and endows them with a form appropriate to its notions of beauty, has a tendency to make the earnest character of devotion disappear, and in this respect destroys religion strictly as religion; so, too, this very process moves forward at the stage we are discussing for the most part by the addition of that which is agreeable and pleases. For it is not by any means the substantial aspect, the significance of the gods, or their universal character, which is evolved by virtue of what delights. Rather it is the finite side, their sensuous existence and subjective inward life, which purports to awake interest and provide satisfaction. The more, therefore, the charm of the existence reproduced is the dominant factor in its beauty to that extent the gracefulness is disentwined from the embrace of the universal and removed from the content, through which alone the profounder penetration could rest satisfied.

The transition to another province of the forms of art is closely united with this externality and articulate definition. For under the mode of externality reposes the manifold of the finite condition; a manifold which, so soon as it secures a free field, asserts itself finally in opposition to the spiritual Idea, its universality and truth, and begins to rouse up the dissatisfaction of thought in a reality which is no longer adequate to express it.

[180] Chapter XLIX.

[181] I presume this is the sense of that difficult word *des Inneren* here.

[182] By "absolute" I presume Hegel means here absolute in the sense of predominant, masterful — activity such as the Greek artist possessed.

[183] "Iliad," I, vv. 9-12.

[184] *Ibid.* vv. 94-100.

[185] "Odyssey," XXIV, vv. 41-63.

[186] That is, Thetis.

[187] *Bestimmte sittliche Substanz.*

[188] *Das reine Insichseyn.*

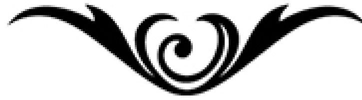
[189] *Ein ewiger Ernst.*

[190] I presume this refers to some drapery or curtains round the bust as exhibited.

[191] This is the meaning of *Heiterkeit* here rather than "cheerfulness," though *Seligkeit* is the usual word.

[192] *Göttliche Universum.* A rather curious expression for, I presume, the ideal totality of the Divine Being.

[193] *Der geistigen absoluten Innerlichkeit.* Lit., "the spiritual and absolute mode of the inward life." He refers, of course, to Christianity, with its life of the pure in heart and the pure reason.



[194] *Besonnenheit.*

[195] "Iliad," XVI, vv. 783-849.

[196] I very much doubt whether the words *Sondern das Gerede allein* can have this meaning, but the obvious meaning, "but only the gossip," hardly makes sense. I think the sentence requires revision.

CHAPTER III

THE DISSOLUTION OF THE CLASSICAL TYPE OF ART

THE GODS OF classical art contain in themselves the germ of their overthrow; consequently, when this fatal defect which they include is brought to consciousness through the elaboration of art itself, they bring about the dissolution of the classical Ideal at the same time. We established as the principle of this, so far as we have here to deal with it, that kind of spiritual individuality which secures in every respect an adequate expression in bodily or external existence immediate to our senses. This individuality was enclosed within a complex of divine personalities, whose definition is not essentially and withal from the first given up to the contingent condition in which the everlasting gods receive the appearance of dissolution for man's conscious life no less than for his artistic creation.

1. FATE OR DESTINY

It is true that sculpture in its complete plastic perfection accepts the gods as substantive potencies, and endows them with a form in whose beauty they in the first instance repose in security, for the reason that the accidental character, of their external envisagement is to the least extent emphasized. Their *multiplicity* and *distinction* does in fact, however, constitute this element of contingency, and thought annuls this in the determinate conception of *one* divinity, through whose inevitable power they are mutually at war with and to the detriment of each other. For however universal the power of every particular god is conceived as specific individuality, such is of a restricted range. Add to this the fact that the gods

do not continue in their eternal repose; they are self-determined relatively to particular aims in actual movement through their being drawn hither and thither by the pre-existing conditions and collisions of concrete reality, in order at one time to afford assistance and at another to obstruct or destroy. These isolated relations in which the gods as active individuals participate contain within them an element of contingency, which impairs the substantive nature of the divine, however much the same may persist as the predominant substratum, and involves the gods in the contradictions and conflicts of a limited finitude. By reason of this finiteness immanent in the gods themselves they fall into contradiction with the loftiness, worth, and beauty of their existence, through which, too, they are eventually brought down to the level of mere caprice and chance. The genuine Ideal evades the complete appearance of this contradiction simply and in so far as — this is preeminently the case in true sculpture and its particular creations as we find them in temples — the divine personalities are represented as explicitly alone in the repose of blessedness, yet retain, as we have already above indicated, a certain aspect of lifelessness, somewhat aloof from all emotion, and withal that quiet characteristic of pathetic lament. It is just this mournfulness which exposes their fate by demonstrating that something of higher import stands above them, and the passage from the particularities of form to their comprehending unity is a necessary one. If, however, we fix our attention on the type and configuration of this loftier unity we shall find that it is, as contrasted with the individuality and relative determination of the gods, the essentially abstract and formless — the necessity, the fate, which under this mode of abstraction the higher can only in general terms be, and which constrains both gods and men, while remaining in itself incomprehensible and inconceivable. Fate is not as yet absolute and self-subsistent end, and thereby at the same time subjective, personal, divine purpose, but merely the one and universal Power which transcends the

particularity of the different gods, and consequently is unable to be presented itself as individual entity; because otherwise it would simply appear as one among many individuals, and would stand above them. For this reason it remains without form and individuality, and is in this abstraction merely necessity and nothing more; with which gods no less than men, when they differentiate themselves as separate from one another, contend. And thus they give effect to their individual power condemned though it be to limitations, and would fain exalt themselves over the bounds and warrant of Fate, though they are, in fact, its subjects, and are forced to hearken to all that unalterably befalls them.

2. THE DISSOLUTION OF THE GODS THROUGH THEIR ANTHROPOMORPHISM

For the reason, then, that the principle of self-determinate Necessity[197] does not appertain to the particular gods, does not supply in other words the content of their self-determination, and only floats over them as an undefined abstraction, the aspect of their insularity as individuals has consequently free play and is unable to escape from Destiny, is moreover at liberty to branch out into the external fabric of the human condition, into the finite consistency of anthropomorphism, possibilities which convert the gods into the reverse of that condition which truly constitutes the notion of what they are essentially and in virtue of their divine nature. The overthrow of these gods of beauty is consequently quite inevitably brought about for art through their own nature. The human consciousness is at last quite unable to find repose in them, and is fain compelled to take leave of them. And, moreover, if we look more closely we shall find that the mode and type of Greek anthropomorphism supplies us with a general example of how the gods vanish away from the faiths of religion no less than those of poetry.

(*a*) Spiritual individuality here makes its appearance in the human form, it is true, as Ideal; but for all that it is in the immediately visible, that is, the bodily presence, not within humanity in all its essential explication, under the mode in which it is conscious of itself in its own self-conscious world as distinct from God, while in the same breath it annuls the distinction, and is, by its own act, as one with God, essentially infinite and absolute self-consciousness.

(*α*) For this reason the plastic Ideal is unable to present itself as infinite self-conscious spirituality. These plastic shapes of beauty are not merely stone and bronze, but also the infinite form of subjective life vanishes from them in their content and expression. We may become as enthusiastic as we please over their beauty and art, but for all that our *enthusiasm* is and remains something native to our own souls; it is not really at home in the objects which it thus contemplates, that is in the gods themselves. To complete the true totality a real reciprocity is required on this side also of the subjective, self-knowing unity and infinity; it is this, and only this, that unfolds our conception of a living God of knowledge, and of men who thus apprehend Him. If this totality is not also essentially and with adequacy conformable to the content and nature of the Absolute, then the Absolute will itself appear not as truly a subject of spiritual being, and its presentment will confront us merely in its objective form without the possession of self-conscious Spirit. It is quite true, no doubt, that the individuality of the gods retains the content of subjectivity, but merely under modes that are contingent, and in a process of development,' which moves independently outside that substantive repose and blessedness of the gods.

(*β*) On the other hand, the subjectivity which is opposed to the gods of plastic art is also not the form of conscious life which is essentially eternal

and true. In other words, this latter is — as we shall see for ourselves more clearly in our consideration of the third type of art, the romantic — that which has before it the objectivity to which it is conformable under the mode of an essentially infinite and self-knowing God. Inasmuch, however, as the knowing subject, at the stage we are now discussing, does not consciously conceive itself as present in the perfections of these godlike figures, nor even in its contemplation of such objects is aware of itself as circumstantially objective, it is still wholly distinct and separate from its absolute object, and is consequently a purely contingent and finite subjectivity.

(*γ*) We might possibly suppose that the passage into a higher sphere of reality would have been emphasized by the imagination and art as a further war among the gods, in a way analogous, in fact, to the first transition from the symbolism of the gods of Nature to the spiritual Ideals of classical art. This is by no means the case. On the contrary, this translation is carried forward in a wholly different field, as a conflict brought home to consciousness between absolute reality and the present world. For this reason art, in its relation to the higher content, which it has to seize under new modes, occupies an entirely altered position. This new configuration does not assert its importance as revelation by means of Art, but is made manifest independently without it, and appears on the prosaic ground of controversial and rational discussion, and from thence is within the soul and its religious emotions, mainly by means of miracle, martyrdoms, and so on, carried into the world of subjective knowledge, together with a consciousness of the contradiction between all that is finite and the Absolute, which unfolds itself in actual history as the process of events toward a Present which is not merely imagined, but is the *fact* we have before us. The Divine, God Himself, becomes flesh, is born, lives, suffers, dies, and rises from the dead. This is a content which heart did not discover,

but which, quite apart from it, was a present fact, and which consequently it has not borrowed from its own domain, but merely supplies a form to it. That old transition and war of the gods, on the contrary, discovered its origins in the artistic or imaginative view of the world simply, which created its wisdom and plastic shapes from its inner life, and gave to astonished mankind his new gods. For this reason the classic gods also have only received their existence through the fiat of the imagination, and merely exist as such in stone and bronze, or in the world open to the senses, not, however, in flesh and blood, or in very and actual Spirit. The anthropomorphism of the Greek gods is therefore without real human existence, that of body no less than that of Spirit. It is Christianity which first introduces us to this reality in flesh and blood as the determinate existence, life, and activity of God Himself. Consequently this bodily form, this flesh, however much also the purely natural and sensuous is recognized as a negation therein, receives its due and honour, and that which partakes of anthropomorphism here is sanctified. Even as man originally was made in the image of God, God is an image of man; whoso beholdeth the Son beholdeth the Father, and whoso loveth the Son loveth the Father. In a word, God is acknowledged as present in the actual world. This new content, then, is not brought home to consciousness by means of the conceptions of art, but is presented from an exterior source as an actual occurrence, as the history of the God who became flesh. A transition such as this could not take its point of departure from Art; the contrast between the old and the new would have been too disparate. The God of revealed religion, in respect to content and form, is very God in truth, in contrast with whom all rivals would become mere creations of the imagination, whom it would be quite impossible to compare with Him on equal terms. The old and new gods of classical art, on the contrary, originate in both cases independently from the ground of the imagination. They have only

such reality from the finite Spirit as enables them to be conceived and represented as potencies of Nature and Spirit; the contradiction and conflict they declare, is taken seriously. If, however, the transition from the Greek gods to the God of Christendom were portrayed in the first instance by Art, the representation of such a war of gods could not in this direct form be enforced in all seriousness.

(*b*) Consequently this strife and transition becomes also, in more recent times, primarily an accidental, isolated subject-matter of art, which can claim to create no true epoch, and has been able in this form to embody no fundamental phase in the line of the entire development of art. We will recall here in this connection, if incidentally, a few of the more famous examples of this nature. We frequently hear in more recent times the lament over the submergence of Greek art, and a yearning towards Greek gods and heroes is not infrequently the theme of our poets[198]. This lamentation is expressed emphatically as in direct opposition to Christendom; and though it is, no doubt, generally granted that it contains the higher truth, the qualification is added that, so far as art is concerned, the transition is only to be regretted. This is the theme of Schiller's "Gods of Greece"; and it is worth our while, even in the present inquiry, to consider this poem, not merely as poetry in the beauty of its exposition, its musical rhythm, its vivid pictures, or in the charm of its regretful mood, which was the motive force in its creation, but also in order to examine the content. Schiller's pathos is always true, no less than poignant, and the result of profound reflection.

It is perfectly true that the Christian religion contains, and may justly claim to accentuate, a certain phase of art; but in the due course of its development, at the time of the Aufklärung[199], it has also reached a point where we find that thought, or rather the Understanding[200], has driven into the background that element, which art pre-eminently requires, the actual human envisagement and revelation of God. For the human form and all

that it expresses and declares, human events, actions, feeling, is the form under which art is forced to conceive and represent the content of Spirit. Inasmuch as the Understanding has converted God into a mere fact of thought, no longer crediting the appearance of His Spirit in concrete reality, and thus has alienated the God of Thought from all actual existence, this type of religious Illumination has necessarily accepted conceptions and requirements which are intolerable to Art. When, however, the Understanding is raised once more from the region of these abstractions into that of Reason, the need at once asserts itself for something more concrete, and withal for that kind of concreteness which Art itself unfolds. The period of the illuminating Understanding has, no doubt, possessed an art of its own, but only of very prosaic type, as we may even find it in Schiller, whose point of departure was precisely that of such a period of criticism; later on, however, owing to his realization how little reason, imagination, and passion were satisfied by the critical Understanding, he experienced a deep longing for art, in the fullest sense of the term, and primarily for the classical art of the Greeks and their gods, and general views of the world. It is from this kind of yearning, a reaction, in short, from the mere abstractions of the mind, that the poem referred to originated. According to the original draft of the poem, Schiller's attitude to Christianity is entirely polemical; afterwards he modified it considerably, no doubt realizing that its *animus* was only directed against the critical aspect of the Illumination, which at a later time itself began to lose its importance. In the first instance he praises the Greek point of view as fortunate in that the whole of Nature was a thing of Life to it, and full of divinities. After that he reviews the Present and its prosaic conception of natural law, and the position man here takes relatively to God:

Diese traur'ge Stille
Kündigt sie mir meinen Schöpfer an?

Finster wie er selbst ist seine Hülle,
Mein *Entsagen*, was ihn feiern kann[201].

No doubt resignation is an essential characteristic in the evolution of the Christian life; but it is only in the monkish conception of it that it requires he should cut off from himself his soul, his emotions, the so-called impulses of his Nature, and should not incorporate his life in the moral, rational, actual world, the family and the State; and it does so precisely as the Illumination and its Deism, which presupposes that God is unknowable, imposes on mankind the extremest form of resignation, namely, that of abandoning all effort either to know or conceive Him. In any true exposition of Christian doctrine, resignation is, on the contrary, merely a phasal moment of mediation, a point of transition, in which that which is purely natural, sensuous, and in general terms finite, strips off this its incompatible nature in order to permit Spirit to attain the loftier freedom and reconciliation of its own possessions, a freedom and blessedness which was unknown to the Greeks. In Christianity as thus understood we are not entitled to speak of the celebration of the one God, of the bare seclusion of Himself, and the cutting ourselves adrift from an ungodly world, for it is precisely in this spiritual freedom and reconciliation of Spirit that God is immanent, and from this point of view the famous lines of Schiller:

Da die Göttes menschlicher noch waren,
Waren Menschen göttlicher[202].

is absolutely false. We must for this very reason emphasize the later alteration made in the concluding lines which refer thus to the Greek gods:

Aus der Zeitfluh weggerissen schweben
Sie gerettet auf des Pindus Höhn;

Was unsterblich im Gesang soll leben,
Muss im Leben untergehn[203].

These words support entirely the assertion we have made above that the Greek gods could only be localized in the mental conception and imagination; they were neither able to affirm such a position in the reality of life, nor satisfy in the long run finite spirit.

Of another sort is the opposition of Parny to Christianity — a poet named the French Tibullus on account of his successful elegies — which is conspicuous in a prolix poem of ten cantos, a kind of epic poem entitled “La Guerre des Dieux,” as an attempt made to bring ridicule upon Christian conceptions in the interests of jest and comedy carried out in a tone of unrestrained frivolity, yet withal marked by good humour and considerable talent. The sallies of wit here are not, however, carried beyond the point of levity; we have few traces of the wanton disregard of things that are sacred and of the highest excellence such as marks the period of Frederick von Schlegel’s “Lucinde.” The Virgin Mary no doubt is treated very badly in this poem. The monks, Dominicans and Franciscans, yield to the seductions of wine and Bacchanals, and the nuns do much the same with Fauns, and the result is sufficiently shocking. Finally, however, the gods of the old world are vanquished and withdraw from Olympus to Parnassus.

As a concluding illustration Goethe in his “Bride of Corinth” has more profoundly depicted in a vivacious picture the banishment of love, not so much as the result of any true principle of Christianity as the misconceived interpretation of resignation and sacrifice. The poet here contrasts that false asceticism which seeks to condemn the determination of a woman to be wife and rates that enforced celibacy as something more holy than marriage with the natural feelings of mankind. Just as we find in Schiller the opposition between the Greek imagination and the critical abstractions of our modern Enlightenment, so we may detect here the Hellenistic ethical

and sensuous justifications in the matter of love and marriage, placed in direct contrast to ideas which can only claim to belong to the Christian religion when regarded from a wholly one-sided and therefore incorrect point of view. With the greatest art a really horrible tone dominates the entire work; and the principal reason is this, that it remains quite uncertain whether the action has reference to a real maiden, or a dead one, a living reality or a ghost; and in the metre of the verse itself in an equally masterly way the threads of light foolery and seriousness are so interwoven as to make the uncanniness still more effective.

(*c*) Before, however, we attempt to gauge in its profundity the new type of art, whose opposition to the old does not come into the course of Art's development, so far, at least, as we here have undertaken to follow it along its fundamental lines, we must in the first instance make clear for ourselves that other transition in its earliest form, which attaches to antique art itself. The principle of this transition consists in this, that the Spirit whose individuality hitherto has been contemplated as in harmony with the true subsistency of Nature and human life, and which, in respect to its own life, volition, and acts, was consciously at home in that accord, begins now to withdraw itself into the infinite subjectivity of its essence, but instead of the true infinity is only able to secure a purely formal and indeed still finite return upon itself.

If we look more closely at the concrete conditions which correspond to the principle indicated, we shall see, we have already done so, that the Greek gods possess as their content the substantive *materiae* of real human life and action. Over and above the vision of the gods we have now the highest mode of determination, the universal interest and the end in determinate life, that is to say, presented at the same time as an existing fact. Just as it was essential to the spiritual configuration of Greek art to appear both as external and real, so, too, the spiritual growth of mankind in

its absolute significance has elaborated itself in a reality that both externally appears and is real, with whose substance and universality the individual has put forward a claim to be in accordant fusion. This highest end was in Greece the life of the State, the collective body of citizens and their morality and living patriotism. Outside this supreme interest there was no other more lofty or true. The life of the State, however, as an external phenomenon of the world, fades into the Past, as do the conditions of the entire reality of the outside world. It is not difficult to demonstrate that a State under the type of such a freedom, so immediately identical with all its citizens, which as such already possess in their grasp the highest activity in all public transactions, is inevitably small and weak, and in part must prove suicidal to itself, in part fall into ruins in the natural course of the history of nations. In other words, by reason of this immediate coalescence of individual life with the universality of State-life, on the one hand we find that the peculiar idiosyncrasies of spiritual experience and its particular aspects as private life do not receive their full dues, nor do they receive sufficient opportunity for a development innocuous to society at large. Rather, as distinct from the concrete substance, into which it has not been accepted, such a nature remains simply the limited and natural egoism, which goes on its own way independently, pursues its interests however much they are alien to the true interest of the whole, and, consequently, is an instrument to the ruin of the State, against which, in the last resort, it strains to oppose its individual forces. On the other hand within the circle of this freedom itself the need of a higher personal liberty is roused, which not merely in the State, as the substantive totality, nor merely in the accepted code of morals and law, but in the very soul of the man himself asserts its claim to exist, in so far as he is ready to give life to goodness and rectitude out of the wealth of his own nature and in the light of his own personal knowledge, and to recognize the same at its real worth. The individual

subject demands of consciousness that it should be, in virtue of its claim as self-identity, a substantive whole. Consequently there arises in this freedom a new breach between the end of the State and that of the man's own personal welfare as essentially free himself. Such a conflict as this had already begun in the time of Socrates, while on the other side the vanity, self-seeking and unbridled character of democracy and demagogy corrupted the true State to such a degree that men like Plato and Xenophon experienced a loathing for the internal condition of their mother-city, where the direction of all public transactions lay in the hands of those who were either frivolous, or those who sought nothing but personal aims.

The spirit of this transition, therefore, depends in the first instance on the general line of severation between Spirit in its unfolded self-subsistency and external existence. The spiritual in this separation from its reality, in which it no longer finds itself reflected, is then the abstract mode of Spirit; it is not, however, the one Oriental god, but on the contrary the actual self-knowing conscious subject, which brings to the fore and retains within the clasp of its ideal subjectivity all that is universal in thought, truth, goodness, and morality, and possesses therein not so much the knowledge of a pre-existing reality as simply the content of its thoughts and convictions. This relation, in so far as it persists in this opposition, and sets up the two aspects of the same as purely opposites to one another, would be of an entirely prosaic character. We do not, however, at this stage as yet arrive at this point of bare prose. In other words it is true that on the one hand we have a consciousness present, which as self-secure, wills the Good, the fulfilment of its desires, conceives the reality of its notion in the virtue of its emotional life, much as we find it thus imaged in the ancient gods, morals, and laws. At the same time, however, this consciousness is split up in opposition to its existence as part of existing Life, in other words the actual political life of the time, the dissolution of the old modes of conception, the former type of

patriotism and political wisdom, and adheres thereby unquestionably to that opposition between the inward life of soul and the real environment outside it. And the reason of this hesitancy is this that the bare conceptions of genuine ethical truth which it derives from its own inner world are unable to fully satisfy it; it consequently faces that which is exterior to this, to which it relates itself in a negative and hostile spirit with the object of changing it. This consciousness is, as already stated, on the one hand no doubt an inward and present content, which, self-determined and at the same time deliberately articulate, is concerned with a world that confronts it, to which this content is opposed, and which receives the task to depict this same reality in the semblance of the very traits of the corruption peculiar to that world, and which form such a contrast with its own ideas of goodness and truth. From another point of view this very contrast is cancelled by art itself. In other words, another type of art arises, in which the conflict of this opposition is not emphasized through the medium of mere thoughts, remaining thus in its disunion; but this reality in the very folly of its corruption is itself submitted to a mode of artistic presentation, which exposes it as self-destructive, and exposes it in such a way that it is precisely in and through this self-destructive process of what is of no weight that truth is enabled to assert itself upon this mirror as the secure and endurable power, and thereby all the force of a direct opposition to what is essentially true is removed from that side represented by folly and unreasonableness. This art is comedy, of the type Aristophanes dramatized for his fellow-citizens, connecting it closely with all that was essential in the world around him, and doing so with equanimity[204], in a mood of pure and hearty joviality.

3. SATIRE

We may, however, observe that this resolution of art, despite its adequacy, tends to disappear to this extent, that the contradictory antithesis persists in the form of its *opposition*, and, consequently, instead of the poetic reconciliation a prosaic relation is imported, by means of which the classical type of art appears to be annulled, and the gods of plastic shape no less than the entire world of human beauty vanish with it. We have, then, now to look about us for a form of art, which is able to reclothe itself from the ruins of this overthrow in a loftier configuration and to extract the real significance which it implies. We discovered as the terminating point of symbolic art in the same way that the separation of pure form from its significance was emphasized in a variety of modes such as simile, fable, parable, riddle, and the like. Inasmuch as the severation above adverted to is causally responsible for the dissolution of that art-type, in a similar way the question arises what is the nature of the distinction between our present example of transition as contrasted with the previous one. The distinction is as follows:

(*a*) In the truly symbolic and comparative type of art the form and significance are from the very first, despite the affinity of their relationship, alien to one another; they are placed, however, in no mere negative, but rather in amicable relationship; for it is precisely the qualities and traits which are identical to or resemble each other on the two sides which assert themselves as the causal basis of their conjunction and comparison. Their persistent separation and hostility is consequently within the bounds of this union neither, relatively to the separated aspects, of a *hostile* character, nor is a blending of the same, within essentially narrow limits, thereby removed from them. The Ideal of classical art, on the contrary, proceeds from the perfect interfusion of significance and form, the ideal individuality of spirit and its external conformation; and when the composite aspects which have been brought together in such a consummated unity are disrupted, this

disruption takes place simply because they are unable any longer to cohere one with the other, and are absolutely compelled to start forth from their peaceful state of harmony in disunion and hostility.

(*b*) Together with this way of looking at the relation in contrast to that of symbolic art we may add that the *content* of both sides is altered, as they now stand in opposition. To put it thus we may say that, in the symbolic type of art, it is abstractions more or less, general thoughts, or at least definite phrases in the form of generalities peculiar to reflective thought, which, by means of the symbolic type of art, receive a sensuous embodiment replete with suggestion. In the form, however, which makes itself predominant in this transition to romantic art the content, it is true, is made up of a similar abstraction of general thoughts, opinions, and maxims of reflective reason, but in this case it is not these abstractions in themselves, but rather their presence in the *individual's* mind and his self-subsistent identity which furnish the content for one side of the opposition. For the primary requirement of this mediating stage consists in this, that the spiritual which has attained the Ideal, shall stand forth in its entire independence. Already in classical art we found that spiritual individuality was of chief importance, albeit on the side of its realization it remained reconciled with a determinate existence as immediately presented. What is of importance now is to declare a mode of subjectivity which strives to acquire the mastery over the form that is no longer adequate to it, in a word, over external reality. In this way the world of Spirit becomes liberated as independent. It recovers itself from bondage to the sensuous material and manifests itself thereby through this return upon its own resources as the subject of a self-consciousness which only finds contentment in the secret wealth of its own domain. This subject, however, which repels externality from itself, is not in respect to its ideal aspect yet the truly concrete totality which encloses as content the Absolute under the mode of self-conscious

spiritual life; rather it is, as still fettered by its opposition to reality, a purely abstract, finite, and unsatisfied form of subjectivity. In opposition to this we have confronting it an equally finite mode of reality, which on its part is also independent, but just for that very reason — forasmuch, that is, as the truth of Spirit has withdrawn from it into its own ideality and henceforward neither will nor can identity itself with it, appears as a reality void of all gods and an existence fallen into rottenness. In this manner and at this point art brings forward a Spirit that thinks, that is, to repeat our former analysis, the individual consciousness of our humanity, which, supporting itself on its own possession of the abstract knowledge and volition of goodness and virtue, confronts with hostility therewith the corruption of its present environment. That aspect of this opposition which remains unresolved, and in which the ideal and external modes of its antithesis persist in their disruption, constitutes the element of prose in the mutual relation of the two sides. A noble mind or a virtuous soul to whom the realization of self-conscious life is denied in a world of vice and folly, turns away from the existence which thus confronts him with passionate indignation, or more subtle wit and more frosty bitterness, and either is wroth with or scorns a world which gives the lie direct to his abstract notions of virtue and truth.

The type of art which accepts this sudden outburst of opposition between a subjectivity still finite in its mode and a degenerate world outside it as its matter is the *Satire*, the ordinary theories as to which have little to commend them, for the simple reason that they break down precisely where we look for their assistance. Satire has nothing to do with epic poetry, and it has just as little affinity with lyric. In the Satire it is not the life of the emotional nature which is expressed; rather the general conception of goodness and what is essentially needful, which it no doubt blends with the particular aspect of soul-life[205], appears as the virtuousness of this or that individual; but this does not suffer itself to be enjoyed in the open and

unhampered beauty of imaginative conception or let that enjoyment issue freely. Rather with discontent it retains the existing discord between the writer's own state of mind and its abstract principles and the empirical reality which mocks them. To this extent satire is neither a genuine creation of the poet nor a real work of art. For these reasons the point of view of the satirical poem can never be reached satisfactorily through those other types of poetry just mentioned; it must be apprehended in a more general way as the example of this very transitional form we referred to from the classic Ideal.

(*c*) Inasmuch, then, as it is, relatively to its ideal content, the prosaic resolution of the Ideal, which asserts itself mainly in satire, we do not find that Greece, which is pre-eminently the native land of Beauty, is the place where we must look for it. Satirical poems of the nature above described are the characteristic possession of Rome. The spirit of the Roman world is the sovereignty of the abstract Ideal, the law that is dead, the shipwreck of beauty and of the joyousness of civic life, the suppression of the family in the sense that it is the immediate and most natural form of morality, and generally the sacrifice of individuality, which surrenders itself wholly to the State, and in obedience to the abstract law is satisfied with the frost-like sense of political worth and critical satisfaction which it supplies. The principle of this civic virtue, the cold-blooded harshness of which subjects to its pleasure all alien peoples, while the formal rectitude of the personal life is elaborated to the furthest point of consistency on equally rigid lines, is wholly inconsonant with genuine art. We find, therefore, even in Rome no art that is at once conspicuous in its beauty, freedom, and greatness. It is from the Greeks that the Romans borrowed all that they mastered whether in sculpture or painting, epic, lyric, or dramatic poetry. It is a remarkable fact that all that we can point to as the native product of Latin art is comic farces, whereas the more cultivated types of comedy, not excluding those of

Plautus and Terence, are borrowed from Greece, and are rather an affair of imitation than independent production. Even Ennius first exhausted the sources of Greek poetry before he made mythology prosaic. That type of art is alone native to the Latin genius, which was essentially itself prosaic, the didactic poem, for example, more particularly when it contains an ethical content, and endows its general reflections with the purely exterior adornment of metre, images, similes, and a rhetorically beautiful diction. But above all other forms thus excepted we place the satire. Here we find it is the mood of virtuous exasperation over the surrounding world which strives to air itself in what is, in some measure, hollow declamations. We can only call this essentially prosaic type of art poetical in so far as it brings before the vision the corrupted nature of real life in such a way that this corruption practically falls to pieces as the result of its own folly. Just as Horace, who as a lyric poet entirely identified himself by study with the artistic type and manner of Greece, in his epistles and satires — where we have his originality more emphasized — traces for us a living picture of the morals of his age, by depicting follies which are self-destructive by virtue of the stupidity, that carries them into effect. Nevertheless, even this example only presents us with a kind of merriment that for all its keen and educated sense can barely be classed as poetry, the object in the main being to make ridicule out of that which is bad. Among others, on the contrary, we find that the abstract conception of rectitude and virtue is deliberately contrasted with vice; and in this case it is exasperation, anger, hate, and scorn, which in some measure expatiate in formal eloquence over virtue and wisdom, and in part give full rein to the indignation of a soul of more nobility against the dissolution and servility of the times, or hold up before the vices of the day the mirror of the old morality, the former liberty, the virtues of a state of the world which has passed away, without any genuine hope and belief in their recovery; or rather one which has nothing to oppose

to the tottering gait, the dilemmas, the need and danger of an ignominious present, save a stoical equanimity and the unshakable conscience of a virtuous soul. Roman history and philosophy not unfrequently receive something of the same tone from a mood of this kind. Sallust must needs express himself strongly against the corruptions of morals, being himself very considerably affected by them. Livy, despite his rhetorical elegance, seeks for comfort and satisfaction in his picture of the good old days. Above all we have Tacitus, who, with a severe melancholy as grand in its scope as it was profound, without the baldness of declamation, indignantly exposes in the clearest relief the evils of his time. Among the satirists Persius is remarkable for his acerbity, with a bitter edge more keen than that of Juvenal. Later on we find bringing up the rear the Greek Syrian Lucian giving free vent to his witticisms and pleasantry against all things, whether heroes, philosophers, or gods; and with exceptional prominence passing in review the ancient gods of Greece on the score of their humanity and individuality. However, only too often he goes no further in his tittle-tattle than the mere external aspect of these godlike figures and their actions, and is for that reason wearisome to modern readers. For, on the one hand, so far as our convictions are concerned, we have already disposed of all that he would destroy, and on the other we are aware that, despite all his jests and mockery, these characteristic traits of Greek divinities, when contemplated under the aspect of beauty, still retain their eternal significance.

Nowadays satirical poems are not likely to prove a success. Cotta and Goethe have proposed competitions in this form of composition, but no poems of note are forthcoming. Certain fixed principles are bound up with it, with which the present age is not in harmony; a wisdom which is devoid of content, a virtue which adheres with inflexible obstinacy to its own resources and nothing beyond, may very possibly contrast itself with the actual world, but is quite unable to bring about the truly poetical resolution

of what is false and repugnant, and effect the genuine reconciliation in the truth.

In one word, Art is unable to persist in this breach between the abstract conceptions of the inward life and the objective world around, without proving itself false to its own principle. The subjective realm of the soul must be conceived as that which is itself an essentially infinite and independent existence, which, albeit it is unable to suffer the finite reality to subsist as Truth itself, nevertheless does not merely assert itself negatively toward the same in a bare contradiction, but proceeds all the while on the path of reconciliation, and for the first time, in its opposition to the ideal individualities of the classical art-form, declares this very activity, being in fact the presentment of the absolute mode of self-conscious life.

[197] Lit. “the essentially-and-for-itself-necessary.”

[198] Hölderlin, and of course Goethe no less than Schiller, would be included. With our moderns such as Swinburne the admission is less obvious than the qualification.

[199] *Die Aufklärung*. That is, the end of the eighteenth century; usually translated as illumination or enlightenment.

[200] *Verstand*, the faculty of science and common sense.

[201]

What! doth this same stillness tell me sadly
All I know of Him who voiced creation?
Dark as e’en the veil that hides Him from me
Is my heart’s salute of resignation.

[202]

Since the gods were then more human
Men were more in image godlike.

[203]

Wrested from the flood of Time's abysses
Saved they float above high Pindus now;
All that was immortal life within them
Lives in song, all other life must go.

[204] *Zornlos* lit., without anger.

[205] I think this is the meaning of the words *mit subjectiver Besonderheit*, but the interpretation "with other material peculiar to the writer" is not impossible.

SUBSECTION III

THE ROMANTIC TYPE OF ART

INTRODUCTION

OF THE ROMANTIC GENERALLY

The type of romantic art receives its definition, as we have hitherto throughout the present inquiry seen was always the case, from the ideal notion of the content, which it is the function of art to declare. We must consequently in the first place attempt to elucidate the distinctive principle of the new content, a content which now, in its significance as the absolute content of truth, opens up to our minds a new vision of the world no less than a novel configuration of art.

In the *first* stage of our inquiry, the entrance chamber of art, the impulse of imagination consisted in the struggle from Nature to spiritual expression. In this strain Spirit never reached beyond what was still only an effort to find, an effort which, in so far as it was not yet able to supply a genuine content for art, could only maintain its position as an external embodiment of the significant aspects of Nature, or those abstractions of the ideal inwardness of substance which were destitute of a subjective character in the strict sense, and in which this type of art found its real centre. The *reverse* of this point of view we discovered in classical art. Here it is spirituality — albeit it is only by virtue of the abrogation of the significances of Nature that it is enabled to struggle forth in its independent self-identity — which is the basis and principle of the content, with the natural phenomenon in the bodily or sensuous material for its external form.

This embodiment, however, did not, as was the case in the first stage, remain superficial, indefinite, and unsuffused by its content; but the perfection of art attained its culminating point by precisely this means, namely, that Spirit completely transpierced its exterior appearance, idealized the shell of Nature in this union of beauty, and drew round itself a reality adequate to its own nature as mind under the mode of substantive individuality. By this means classical art was a presentation of the Ideal which completely satisfied its notion, the consummation of the realm of beauty. More beautiful art than this can neither exist now nor hereafter.

But for all that we may have an art that is more lofty in its aim than this lovely revelation of Spirit in its immediate sensuous form, if at the same time one that is created by the mind as adequate to its own nature. For this coalition, which perfects itself in the medium of what is external, and thereby makes sensible reality its adequate and determinate existence, necessarily runs counter to the true notion of Spirit, and drives it forth from its reconciliation in the bodily shape upon its own essential substance to seek further reconciliation in that alone. The simple and unriven totality of the Ideal is dissolved, and breaks up into one of twofold aspect, namely, that of the essentially subjective life and its exterior semblance, in order to enable mind, by means of this severation, to win the profounder reconciliation in its own most proper element. In one word, Spirit, which has for its principle the mode of entire self-sufficiency, the union of its notion with its reality — is only able to discover an existence that wholly corresponds to such a principle in its own spiritual world of emotion, soul, that is to say, in the inward life where it feels at home. The human spirit becomes aware that it must possess its Other, its *existence*, as Spirit, which it appropriates as its own and what it verily is, and by doing so at length enjoys its own infinity and freedom.

1. This elevation of Spirit to its *own substance*, through which it attains its objectivity — which it would otherwise be obliged to seek for in the external environment of its existence within its own self and in this union with itself both feels and knows itself — is what constitutes the fundamental principle of romantic art. With this truth we may join as a corollary thereto that for this concluding stage the beauty of the classic Ideal, or in other words beauty in its most uniquely consonant form and its most conformable content, is no longer regarded as ultimate. For in arriving at the point of romantic art, Spirit[206] becomes aware that its truth is not fully attained by a self-absorption in the material of sense. On the contrary, it only comes fully to the knowledge of that truth by withdrawing itself out of that medium into the inward being of its own substance, whereby it deliberately affirms the inadequacy of external reality as a mode of its existence. It is owing to this that when this new content is set the essential task of making itself an object of beauty, the beauty, in the meaning of the terms under which we have met with it before, only persists as a subordinate mode, and the new conception of it becomes the *spiritual* beauty of what is its own ideality made fully explicit, in other words, the subjectivity of Spirit essentially infinite in its mode.

In order, however, that mind may attain the infinity which belongs to it it must transcend at the same time purely formal and *finite* personality and rise into the measure of the *Absolute.* That is to say, Spirit must declare itself as fulfilled with that which is out and out substantive, and in doing so proclaim itself as a self-knowing and self-willing subject. Conversely, therefore, what is substantive and true is no longer to be apprehended as a mere "beyond" relatively to our humanity, and the anthropomorphism of the Greek view of things can be struck out; and in the place of this we have humanity as very and real subjectivity affirmed as the principle, and by

virtue of this change, as we have already seen, anthropomorphism for the first time reflects a truth of complete and final validity.

2. We have now in a general way to develop the range of subject-matter, no less than its form, from the earliest phases in the evolution of this principle, whose configuration, as it thus changes, is conditioned by the new content of romantic art.

The true principle of the romantic content is absolute inwardness[207], and the form which corresponds to it, the subjectivity of mind, meaning by this the comprehension of its self-subsistence and freedom. This intrinsically infinite principle and explicitly enunciated universal is the absolute negation of all particularity[208]; it is simple unity at home with itself, which consumes all that is separable, all processes of Nature and its succession of birth, passing away, and reappearance, all the limitations of spiritual existence, and dissolves all particular gods in its pure and infinite self-identity. In this Pantheon all gods are dethroned; the flame of the subjective essence has destroyed them; instead of the plastic polytheism art recognizes now *one* God only, *one* Spirit, *one* absolute self-subsistence, which as the absolute knowledge and volition of itself remains in free union with it, and no longer falls to pieces in the particular characters and functions we have reviewed above, whose single unit of cohesion was the force of an obscure Necessity. Absolute subjectivity, however, in its purity would escape from art altogether, and only be present in the apprehension of Thought, unless it could enter into external existence in order that it might be a subjectivity which was *actual* if also conformable to its notion, and further could recollect itself in its own province from out of this reality. And, what is more, this moment of reality is pertinent to the Absolute, because the Absolute, as infinite negativity, contains this self-relation — as simple unity of knowledge at home with itself, and therewith as *immediacy* — for the final consummation of its activity. On account also of this its immediate

existence, which is rooted in the Absolute itself, the Absolute declares itself not as the one jealous God, who merely annuls the aspect of Nature and finite human existence, without revealing itself verily therein under the mode of actual divine subjectivity; rather the very Absolute unfolds itself, and takes to itself an aspect, relatively to which it is also within the grasp and presentation of art.

The determinate existence of God, however, is not the natural and sensuous in its simplicity, but the sensuous as brought home to that which is not sensuous, in other words to the subjectivity of mind which, instead of losing the certainty of its own presence as the Absolute, in its external envisagement, for the first time, and by no other means than this its reality, is made aware of its actual presence as such. God in His Truth is consequently no mere Ideal begotten of the imagination, but He declares Himself in the heart of finite condition and the external mode of contingent existence, and is, moreover, made known to Himself therein as divine subjective life, which maintains itself there as essentially infinite and creating this infinity for itself. Inasmuch, then, as the actual subject[209] is the manifestation of God, Art for the first time secures the superior right to apply the human figure and its mode of externality generally as a means to express the Absolute, although the new function of art can only consist in making the external form not a means whereby the ideality of man's inward condition is absorbed in exterior bodily shape, but rather conversely to make the consciousness of the Divine mind visible in the subject of consciousness. The distinguishable phases, which combine to make up the totality of this apprehension of the world-condition as, that is to say, the concrete totality of truth, are consequently made manifest to mankind from this point onwards under such a mode that it is neither the Natural in its simplicity, such as sun, heavens, stars, and so forth, nor the Greek conclave of the gods of beauty, nor the heroes and practical exploits in the field of the

family cultus and political life — it is neither one nor any of these which supplies us with either content or form. Rather it is the actual and isolated individual subject who receives in the inward[210] substance of his living experience this infinite worth, for it is in him alone that the eternal characters of absolute Truth — which is made actual only as Spirit — expand out of their fulness within, and are concentrated to the point of determinate existence.

If we contrast this definition of romantic art with that which was proposed to the classical — that is to say, as Greek sculpture completed the latter under the mode most conformable to it — it is obvious that the plastic figure of the god does not express the motion and activity of Spirit, in so far as the same has retired from its actual bodily shape, and has penetrated to the inner shrine of independent self-identity. That which is mutable and contingent in the empirical aspect of individuality is no doubt removed from those lofty, godlike figures: what, however, fails them is the actualization of the subjective condition in its self-subsistent being as shown in self-knowledge and self-volition. This defect makes itself felt on the exterior side in the notable fact that the direct expression of soul in its simplicity, the light of the eye, is absent from the sculptured figure. The most exalted works of beautiful sculpture are sightless. The inward life does not look forth from them as self-conscious inwardness such as this concentration of Spirit to the point of light made visible in the human eye offers us. This light of the soul falls outside of them, and is the possession of the beholder alone: he is unable to look through these figures as soul direct to soul, and eye to eye. The God of romantic art, however, is made known with sight, that is, self-knowing, subjective on the side of soul, and that soul or divine intimacy disclosing itself to soul. For the infinite negativity, the withdrawal of the spiritual into itself, cancels its discharge in the bodily frame. This subjectivity is the light of Spirit, which reveals itself

in its own domain, in the place which was previously obscure, whereas the natural light can only give light on the face of an object, is in fact this *terrain* and object, upon which it appears, and which it is aware of as itself[211]. Inasmuch as, however, this absolute intimacy of the soul expresses itself at the same time as the mode of human envisagement in its actual existing shape, and our humanity is bound up with the entire natural world, we shall find that there is no less a wide field of variety in the contents of the subjective world of mind than there is in that external appearance, to which Spirit is related as to its own dwelling-place.

The reality of absolute subjectivity, as above described, in the mode of its visible manifestation, possesses the following modes of content and appearance.

(*a*) Our first point of departure we must deduce from the Absolute itself, which as very and actual mind endows itself with determinate existence, is self-knowing in its thought and activity. Here we find the human form so represented that it is known immediately as the wholly self-possessed Divine. Man does not appear as man in his solely human character, in the constraint of his passions, finite aims, and achievements, or as merely conscious of God, but rather as the self-knowing one and only universal God Himself, in whose life and sufferings, birth, death, and resurrection He reveals openly also to finite consciousness, what Spirit, what the Eternal and Infinite in their veritable truth are[212]. Romantic art presents this content in the history of Christ, his mother, and his disciples, with all the rest of those in whom the Holy Spirit and the perfected Divine is manifested. For in so far as God, who is above all the essential Universal, exists in the manifestation of human existence, this reality is not, in the Divine figure of Christ, limited to isolate and immediate existence, but unfolds itself throughout the entire range of that humanity, in which the Spirit of God is made present, and in this actuality continues in unity with itself. The

diffusion of this self-contemplation, this essential self-possession of mind[213], is peace, in other words the reconciled state of Spirit with its own dominion in the mode of its objective presence — a divine world, a kingdom of God, in which the Divine, which has for its substantive notion from the first reconciliation with itself, consummates this result in such a condition, and thereby secures its freedom.

(*b*) However much, we must fain add, this identification asserts itself as grounded in the essence of the Absolute itself, as spiritual freedom and infinity it is no reconciliation which immediately is visible from the first in either the real worlds of Nature or Spirit; on the contrary, it is only accomplished as the elevation of Spirit from the finitude of its immediate existence to its truth. As a corollary of this it follows that Spirit, in order to secure its totality and freedom, must effect an act of self-severation, and set up on the one side itself as the finitude of Nature and Spirit to its opposed self on the other as that which is essentially infinite. Conversely with this act of disruption the necessity is conjoined that from out of this retirement from its unity — within the bounds of which the finite and purely natural, the immediacy of existence, the "natural" heart in the sense of the negative, evil and bad, one and all are defined — a way is at last found by virtue of the subjugation of all that has no substantive worth within the kingdom of truth and consolation. In this wise the reconcilement of Spirit can only be conceived as an activity, a movement of the same, can only be presented as a process, in whose course arise both strain and conflict, and the appearance and reappearance, as an essential feature of it, of pain, death, the mournful sense of non-reality, the agony of the soul and its bodily tenement. For just as God in the first instance disparts finite reality from Himself, so, too, finite man, who starts on his journey outside the divine kingdom, receives the task to exalt himself to God, to let loose from him the finite, to do away with the nothing-worth, and by means of this decease of his immediate

reality to become that which God in His manifestation as man accomplished as very truth in the actual world. The infinite pain of this sacrifice of the most personal subjectivity, sufferings, and death, which for the most part were excluded from the representation of classical art, or rather only are presented there as natural suffering, receive their adequate treatment necessarily for the first time in romantic art. It is, for example, impossible to affirm that among the Greeks death was ever conceived in its full and essential significance. Neither that which was purely natural, nor the immediacy of Spirit in its union with the bodily presence, was held by the Greeks as something in itself essentially negative. Death was consequently to them purely an abstract passing over, unaccompanied by horror or fearsomeness, a cessation without further immeasurable consequences for the deceased. If, however, conscious life in its spiritual self-possession is of infinite worth then the negation, which death enfolds, is a negation of this exaltation and worth, and it is consequently fearful, a death of the soul, which is in the position of finding itself thereby as itself now this negative in explicit appearance, excluded for evermore from happiness, absolutely unhappy, delivered over to eternal damnation[214]. Greek individuality, on the contrary, does not, regarded as spiritual self-consciousness, attach this worth to itself; it is able, consequently, to surround death with more cheerful images. Man only fears the loss of that which is of great worth to him[215]. Life possesses, however, only this infinite worth for mind if the subject thereof, as spiritual and self-conscious, is reality in its absolute unity, and is compelled with an apprehension, in this way justified, to image itself as doomed to negation by death. From another point of view, however, death also fails to secure from classical art the *positive* significance which it receives from romantic art. The Greeks never treated with real seriousness what we understand by immortality. It was only in later times that the doctrine of immortality received at the hands of Socrates a profounder

significance for the introspective reflection of human intelligence. When, for example, Odysseus[216] praises the happiness of Achilles in the lower world as one excelling that of all others who were before or came after him on the ground that he, once revered as a god, is now greatest chief among the dead, Achilles in the well-known words rates this fortune at a very low rank indeed, and makes answer that Odysseus had better utter no word of comfort to him on the score of death; nay, he would rather be a mere serf of the soil, and poor enough serve a poor man for wage, than rule as lord over all the ghosts of the dead who have vanished to Hades. In romantic art, on the contrary, death is merely a decease of the natural soul and finite consciousness, a decease, which only proclaims itself as negative as against that which is itself essentially negative and abolishes what has no real substance, and is consequently the deliverance of Spirit from its finitude and division, mediating at the same time the spiritual reconciliation of the individual subject with the Absolute[217]. Among the Greeks life in its union with the existence of Nature and the external world was the only life about which you could affirm anything, and death was consequently pure negation, the dissolution of immediate reality. In the romantic view of the world, however, death receives the significance due to its negativity, in other words the negation of the negative[218], and returns back to us thereby equally as the affirmative, as the resurrection of Spirit from the bare husk of Nature and the finiteness which it has outgrown. The pain and death of the extinguished light of individual being awakes again in its return upon itself in fruition, blessedness, and in short that reconciled existence which Spirit is unable to attain to save through the dying of its negative state, in which it is shut off from its most veritable truth and life. This fundamental principle does not therefore merely affect the fact of death as it approaches man in his relation to the world of Nature, but it is bound up with a process, which

Spirit has to sustain in itself, quite independently of this external aspect of negation, if life and truth are to join hands.

(*c*) The *third* presentment of this absolute world of Spirit is co-ordinated by man, in so far as he neither makes manifest the Absolute and Divine in its immediate and essential mode as such *Divine*, nor declares positively the process in which he is exalted to the Supreme Being, and reconciled with Him, but rather continues within the ordinary sphere of his human life. Here it is the purely *finite* aspect of that existence which constitutes the content, whether we regard it in the light of its spiritual purposes, its worldly interests, passions, collisions, suffering, and enjoyments, or from that point of view which is wholly external, that of Nature, its kingdom, and all its detailed phenomena. In order to apprehend this content with adequacy, however, we must take up two distinct positions relatively to it. In other words, it is true that Spirit, for the reason that it has secured the principle of self-affirmation, expatiates in this province, as one on which it has a just claim, and one which, as native to it, provides satisfaction, an element from which it merely extracts this positive character[219], and is permitted thereby itself to be reflected in its positive satisfaction and intimacy; yet, on the other hand, we have the fact that this content is brought down to the level of pure contingency, a contingency which is unable to claim any independent validity, for the reason that mind cannot discover therein it veritable existence, and consequently only preserves its substantial unity by independently on its own account breaking up again this finite aspect of Spirit and Nature as a thing of finitude and negation.

3. In conclusion, then, so far as the relation of this content in its entirety to its mode of presentation is concerned, it would appear, in the first place, agreeably to what we have above stated, that the content of romantic art, relatively to the Divine, at any rate, is very *limited.*

(*a*) For, first, as we have already indicated, Nature is divested of the Divine principle; in other words, the sea and mountains, valleys, Time, and Night, briefly all the general processes of Nature, have here lost the worth which they carry when related to the presentation and content of the Absolute. The images of Nature receive no further expansion in a symbolic significance. The thesis that their shapes and activities might possibly sustain traits of Divine import is taken away from them. For all the mighty questions in regard to the origin of the world, in regard to the Whence, Wherefore, and Whither, of created Nature and humanity, and all the symbolical and plastic experiments in the resolution and exposition of these problems disappear at once in the revelation of God in Spirit; and we may add that also in the spiritual sphere the world of variety and colour, with the characters, actions, and events, as they were envisaged by classical art, are now concentrated in *one* single *light-focus* of the Absolute and its eternal history of redemption. The whole content meets, therefore, at this single point of the Inmost of Spirit[220] — that is, of feeling, imagination, soul — all that strains after a union with truth, that seeks and wrestles to bring to birth the Divine in consciousness, and to maintain it; and, furthermore, is constrained to execute the world's aims and undertakings, not so much for the *world's* sake as to further the unique and essential undertaking of its heart by means of the spiritual conflict of man's inward nature and his reconciliation with God, presenting personality and its conservation no less than all that paves the way to them for this object, and this alone. The heroism, which makes its appearance as the result of such aspirations, is not the kind of heroism which prescribes laws by its own fiat, establishes new systems, creates and informs circumstances, but rather a heroism of submission, which accepts everything as predetermined and ordered above it, and whose energies are now wholly restricted to the task of regulating temporal events in line with such direction, and making that which is in

keeping with the higher order and of independent stability a valid factor in the world as if is and in the Time-process. For the reason, however, that this absolute content appears as concentrated to a focus in the inward *life of the soul*, and the entire process is imported into the life of mankind, the range of this content is thereby also infinitely extended. It *expands*, in fact, to a manifold variety practically without limit. For although every objective history supplies what is substantive in that self-concrete soul-life, yet for all that the subject of the same reviews it in all its aspects, presents isolated features taken from it, or unfolds it as it appears in continually novel human traits by way of addition, and may very well into the bargain both import the entire expanse of Nature, as environment and *locale* of Spirit, and divert them to the one single object referred to. By this means the history of soul-life is infinitely rich, and can adapt its form to ever shifting conditions and situations in every possible way. And, further, if the individual at last steps forth from this absolute sphere and actively engages in worldly affairs, the range of interests, objects, and emotions will be difficult to count on the score in proportion as the spiritual self-possession is profound, agreeably to the principle in its fullest application; man is consequently distracted by an infinitely multiplied profusion of interior and exterior collisions, revolutions, and gradations of passion, and the most manifold degrees of satisfaction. The Absolute in its unqualified and essential universality, in so far, that is, as it is unfolded in the conscious life of the human soul, constitutes the spiritual content of romantic art; and for this reason his collective humanity, no less than its entire evolution, becomes its inexhaustible material.

(*b*) Romantic art does not, however, *as art* educe this content in the way we found was the case for the most part in symbolic art, and, above all, in the classical type and its ideal gods. Romantic art, as we have seen already, is not, in its *specific* capacity, the instructive *revelation*, which, merely in

the form of art, makes the content of truth visible to the senses. The content is already present in the conceptive mind, and the emotions independently and outside the sphere of art. *Religion*, as the consciousness of truth in its universality, is here an essential *premiss* of art to a degree totally different from what it was in the previous cases; and, even if we look at the position in its wholly exterior aspect for the consciousness that is actual in the reality of the material world, it lies before us as the prosaic fact of the very present. That is to say, inasmuch as the content of revelation to mind is the eternal absolute nature of *mind*[221] itself, which breaks itself loose from Nature in its bareness and *subordinates* the same, its manifestation in the immediacy of present life is such that the external material, in so far as it consists and is existent, only continues as a contingent world, out of which the Absolute recollects itself in the secret wealth of Spirit, and only by such means attains independence and truth. The external show receives thus the imprimatur of an indifferent medium, in which Spirit can repose no ultimate trust, and in which it can find no dwelling-place. The more it conceives the conformation of external reality as unworthy of its fulness the less it becomes able to seek consolation therein, or to discover its task of self-reconcilement consummated by a union therewith.

(*c*) The manner in which, therefore, romantic art gives to itself a real embodiment agreeably to the spirit of the principle above indicated, and on the side of its external appearance, is not one which essentially overleaps the ordinary presentment of reality: it is by no means averse to accept as cover for itself real existence in its finite defects and definition. That beauty therefore disappears from it, which tended to raise the outside envisagement above the soilure of Time, and the traces that unite it with a Past, in order to declare the beauty of existence in its blossom in the room of what had otherwise been a dismantled image. Romantic art has no longer for its aim

the freedom and life of existence in its infinite tranquillity and absorption of the soul in the bodily presence; no more a life such as *this* arrests it. It turns its back on this pinnacle of beauty. It interweaves the threads of its soul experience with the contingent material of Nature's workshop, and gives unfettered play to the emphatic features of ugliness itself. We have, in short, two worlds included in the Romantic, a spiritual realm essentially complete in itself, the soul-kingdom, which finds reconciliation in its own sphere, and therewith the otherwise straightforward repetition of birth, death, and resurrection now for the first time perfected in the true circular orbit, doubled back in the return upon itself, the genuine Phoenix life of Spirit. On the other hand, there is the realm of external Nature simply as such, which, released as it is from its secure association and union with Spirit, becomes now a completely empirical reality, concerning the form of which the soul cares little or nothing. In classical art Spirit controlled the empirical phenomenon and transpierced it through and through, because it was the very thing which it had to accept as its completed reality. But now the ideal kingdom is indifferent to the mode of configuration in the world of immediate sense, because this immediacy is beneath the sphere of the blessedness of essential soul-life. The external phenomenon is no longer able to express this inward life; and if any call is made upon it for this purpose, it merely is utilized to make plain that the external show is an existence which does not satisfy, and is forced to point back by suggestion to the spiritual content, the soul and its emotions, as the truly essential medium. Precisely for the same reason romantic art suffers externality on its own part to go on its way freely; and in this respect permits all and every material, flowers, trees, and so on, down to the most ordinary domestic utensils, to appear in its productions just as they are, and as the chance of natural circumstance may arrange them. Such a content as this, however, carries at the same time with it the result, that as purely exterior matter, its

worth is of no validity and insignificant; it only receives its genuine worth when the soul has made itself a home in it, and it is taken to express not merely the ideal, but *spiritual inwardness*[222] itself, which, instead of blending itself with the exterior thing, appears simply to have attained its own reconciliation with itself. The ideality thus brought home to a point is that mode of expression which is without externality, invisibly declaring itself, and only itself, in other words, a tone of music simply, which is neither an object nor possesses form, a wavelet over waters[223], a ringing sound over a world, which, in sounds such as this, and the varied phenomena which are united with it, can only receive and reflect one reverberation of this self-absorption of the soul.

To sum up, then, in a word, this relation of content and form in the romantic type, where it remains true to its distinctive character, we may affirm that the fundamental note of the same, for this very reason that its principle constitutes an ever expanding universality and the restlessly active depths of heart and mind, is that of *music*, and when combined with the definite content of imagination, lyrical. This *lyrical* aspect is likewise the primary characteristic of romantic art, a tone which gives the key-note also to the epic poem and drama, and which is wafted as a breath of soul even around the works of the plastic arts, since here, too, spirit and soul are desirous of speaking by means of the plastic shape to soul and mind.

As regards the *division* of our subject, which we must now in conclusion determine for the examination of this our third extensive domain of artistic production on the lines of its development, we shall find that the basic notion of the romantic relatively to its substantive and progressive articulation is comprised most conveniently in three branches of division we may define as follows.

The *first* sphere is the province of *religion* strictly, in which the redemption history, the life, death, and resurrection of Christ constitute the

central interest. The principle which is emphasized as all-important here is that self-involution which mind accomplishes by negating its immediacy and finitude, overcoming the same, and by means of this liberation secures its own self-possessed infinity and absolute self-subsistence in its own kingdom.

This self-subsistence passes, then, in the *second* place from the Divine dwelling of essential Spirit, surrenders its pure exaltation of finite man to God, in order to enter the *temporal world*. Here it is, in the first instance, the subject of consciousness simply, which has become self-affirmative, and which possesses as the substantive material of its content, no less than as the interest of its existence, the virtues of this positive subjectivity, such as honour, love, fidelity, and bravery, the aims and obligations, in short, of romantic chivalry.

The content and form of the *third* chapter may be generally indicated as the *formal consistency of character*. In other words, if the subjective life has been so far concentrated, that spiritual independence is its essential characteristic, it follows also that the *particular* content, with which such independence is associated as with what is strictly its own, will also partake of such a character; this self-subsistence, however, inasmuch as it does not, as was the case in the sphere appertinent to essential and explicit religious truth, repose in the substantive core of its life, is only able to reach a formal type. Conversely the configuration of external conditions, situations, and events is now also independently free, and is involved consequently in every sort of capricious adventure. For this reason we find, to put it in general terms, as the termination of the romantic, the contingency of the exterior condition and internal life, and a falling asunder of the two aspects, by reason of which Art commits an act of suicide, and betrays the fact that conscious life must now secure forms of loftier significance, than Art alone is able to offer, in which to grasp and retain truth.

[206] Throughout, of course, the German word translated in these paragraphs as mind or spirit is *Geist.*

[207] Absolute ideality may perhaps interpret the text more intelligibly.

[208] It is so because as self-identity it distinguishes itself from everything to which it is related.

[209] *Das wirkliche Subjekt*, Hegel means, of course, individual man.

[210] "Most intimate" would perhaps express the meaning more clearly.

[211] Hegel here gives expression to what is perhaps not wholly defensible logic, though it may be truly poetic mysticism.

[212] I would refer any reader who is inclined to gasp at this interpretation of Christian revelation to some useful remarks of Professor Bosanquet in his Preface to his translation, p. XXVIII.

[213] *Die Ausbreitung dieses Selbstanschauens, In-sich-und-Bei-sich-seyns des Geistes ist der Frieden.* One of Hegel's terrors for the translator, though the sense is obvious enough.

[214] The analysis no doubt has its interest. But among other difficulties it is not easy to see how the argument, based as it is on rational grounds, makes for anything but annihilation. Death is a negation — it, according to the argument, puts an end to the "process" — what remains then is apparently the evanescence of the finite spirit. This reference to "happiness" assumes that conscious individual life continues, which is a mere *pelitio principii.* If it continues the former dual aspect would seem to be implied in it. The analysis of the actual significance of death for Christendom and Greek paganism retains, of course, its validity.

[215] But surely in a sense personal life, if only limited to Earth's existence, may be, I do not say necessarily is, all the more valuable. This is an important aspect of the matter which is not here adequately answered, and it suggests a real grievance against the extravagant follies of a certain type of Christendom. The present feeling of the wisest minds of our own time will

be inclined to regard a good deal of Hegel's remarks here as insufficient or lacking directness. One recalls those significant lines of a great writer but recently taken from us:

Sensation is a gracious gift
But were it cramped in station,
The prayer to have it cast adrift
Would spout from all sensation.

Hegel's point of view seems neither to be that of mysticism nor mere absorption.

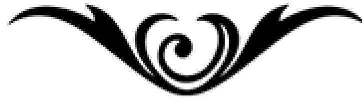
[216] "Odyssey," XI, vv. 481-91. But this illustration is at least evidence of the high value a Greek attached to life on Earth.

[217] True enough as an analysis of the Christian consciousness; but the difficulty above pointed out remains so far as the writer refers to a future life, which he sometimes appears to do, sometimes not. Conditions are assumed for human personality of which we can form no conception.

[218] He means it is the negation of that which is itself a negation, finite existence. The conclusion is of course, as above suggested, replete with difficulty.

[219] That is, I presume, the positive character of natural conditions; but it may mean its own "affirmative" relation.

[220] *Auf die Innerlichkeit des Geistes.*



[221] Reason or Spirit are perhaps preferable.

[222] The German words are *das Innerliche* and *die Innigkeit.*

[223] This is obviously not wholly independent of form.

CHAPTER I

THE RELIGIOUS DOMAIN OF ROMANTIC ART

INASMUCH AS ROMANTIC art, in the representation of the consciousness of absolute subjectivity, understanding this as the comprehension of all truth, the coalescence of mind with its essence — receives its substantive content in the satisfaction of soul-life, in other words the reconciliation of God with the world and therein with Himself, it follows that at this stage the Ideal for the first time is completely at home. For it was blessedness and self-subsistency, contentment, repose, and freedom which we declared as most fundamentally defining the Ideal. Of course, we cannot therefore on this account deduce the Ideal simply from the notion and reality of romantic art; but relatively to the classic Ideal the form it receives is entirely altered. This relation, already in general terms indicated, we must now before everything else establish in its fully concrete significance, in order to elucidate the fundamental type of the romantic mode of presentation. In the classical Ideal the Divine is in one aspect of it restricted to pure individuality; in another aspect the soul and spiritual blessedness of particular gods find their exclusive discharge through the physical medium; and as a third characteristic, for the reason that the inseparable unity of each individual both essentially and in its exterior form supplies the principle of the same, the negativity of the dismemberment implied in human life, that is the pain of both body and soul, sacrifice, and resignation are unable to appear as essentially pertinent to these godlike figures. The Divine of classical art falls, it is true, into an aggregation of gods, but there is no organic and essential self-division, no universally proclaimed essence such

as we find in the particular presentment of man whether in form and spirit, whether empirically or subjectively considered; and just as little has it confronting it, as being itself the Absolute in invisible form, a world of evil, sin, and ignorance, together with the task of resolving such contradictions in harmony, and only by thus growing on level terms with the very truth and divine out of this reconciliation. In the notion of the absolute subjectivity, on the contrary, this opposition between substantive universality and personality is inherent, an opposition, whose consummated mediation the subjective ideality perfects with its substance, exalting thereby the substantive presence to the articulate and absolute subject of self-knowledge and volition. But there is, *secondly*, appertinent to the reality of the subjective condition conceived as mind the profounder contradiction of a finite world, through whose abrogation as finite, and by whose resultant reconciliation with the Absolute the Infinite by virtue of its own absolute activity makes its proper being self-subsistent, and so for the first time exists as absolute Spirit. The appearance of this actuality on the *terrain*, and in the configuration of the human spirit receives consequently, in respect to its *beauty*, a totally different mode of relation to that presented by classical art. Greek beauty unfolds the inward aspect of spiritual individuality solely as it is envisaged by means of its bodily shape, actions, and events, wholly expressed in what is exterior, and living wholly therein. For romantic art, on the contrary, it is absolutely necessary that the soul, albeit envisaged in the exterior medium, should at the same time demonstrate its capacity of self-withdrawal from the tenement of the body and self-substantive life. The bodily frame can therefore now only express the inwardness of mind, in so far as it makes it plain that it is not in this material existence, but in itself, that the soul discovers its congruent reality. On account of this beauty is now no longer an idealization in respect to the objective form, but rather the ideal and essential configuration of the soul itself; it is in short a beauty of

spiritual ideality, that is the specific mode of such, as every content is informed and elaborated within the temple of the subjective world, and without retaining the external medium in this its permeation with Spirit. For the reason, then, that by this means the interest disappears, which consists in clarifying real existence to the point of our classical unity, and is concentrated in the contrary direction of wafting a new breath of beauty through the unseen content of the spiritual itself, art ceases to retain the old solicitude for what is exterior at all. It accepts the same directly as it may chance to find it, leaving it to take whatever form may happen to please it. The reconciliation with the Absolute is in the Romantic an act of the inward life, which no doubt is embodied externally, but which does not retain that exterior in its material realization as its essential content and object. We may observe that in close association with this indifference towards the idealizing union of soul and body, and in its relation to the external treatment of the more predominant individuality of a sitter, we find the art of *portraiture*, which does not entirely erase particular traits and lines, as they are found in Nature, and her inevitable deficiencies — defects inseparable from finite effects — in order to replace them with something more adequate. Generally speaking even here there is a certain limit to the licence given to Nature in this respect; but to the general aspect of form in the first instance it is quite indifferent; and no attempt is made to exclude wholly from it the accidental impurities of finite and sensuous existence.

We may adjoin a further quite sufficient reason for the imperative character of this radical definition of romantic art from another point of view. The classic Ideal, where we find it at the culminating point of its very truth, is self-exclusive, self-subsistent, retiring and not susceptible[224] in its nature, an orbed individual totality, which repels all else from itself. Its conformation is uniquely its own; its life is bound up in that and that exclusively, and it will harbour no affinity with what is purely empirical and

contingent. Whoever, therefore, approaches an ideal such as this as spectator, is unable to appropriate its existence as an embodiment strictly akin to that of his own presence. The figures of the eternal gods, albeit human, do not belong to our mortality, for these gods have not themselves experienced the infirmities of finite existence, but are directly exalted above them. Their affinity with what is empirical and relative is interrupted. The infinite subjectivity, what we call the Absolute of romantic art, is on the contrary not absorbed in its presentment; it is rather carried into its *own* domain, and for this very reason retains such external aspect as it possesses not so much *for itself* as for the contemplation of others, as, in short, an exterior presence which is freely offered for this purpose. This externality must further appear in the form of common fact, the human as our senses perceive it, since it is through that that God Himself descends to the level of finite and temporal existence, in order to mediate and reconcile the absolute antithesis, which is inherent in the notion of the Absolute. For this reason our empirical humanity also contains in its bodily presence an aspect, which unfolds to man a bond of affinity and kinship, by virtue whereof he is able to contemplate even his direct natural presence with assurance; and he can do so because the Divine incarnation does not, with the severity of the classical type, thrust on one side the particular and contingent, but presents to his vision that which he himself possesses, or that which he recognizes and loves in others around him. It is just this homeliness incidental to what we ordinarily meet with which attracts and enables romantic art to entrust itself to the external aspect of reality. Inasmuch, then, as the externality which is turned adrift is called upon, through this very abandonment, to suggest the beauty of soul, the lofty pretension of its spirituality and the sacred colour of the emotional life, so, too, at the same time, it is a condition of its doing so that it be absorbed itself within the ideal realm of mind and its absolute content, and that it appropriate the same.

To sum up finally what is implied in this act of surrender we may assert that it consists in the general conception, that in romantic art the infinite subjectivity does not abide in solitary self-sufficiency, as the Greek god did, living in the full perfection and blessedness of his self-exclusion; rather it moves out of itself in relation to somewhat else, which, however, is its own substance, in which it discovers itself again and continues all the time in union with itself. This condition of self-unity in some other that is yet its own is the real form of beauty appropriate to romantic art, the Ideal of the same, which receives for its mode and envisagement what is, in its essence, subjective ideality or inwardness, soul-life and its attendant emotions. The romantic Ideal expresses, therefore, the relation to another spiritual correlative, which is so closely associated with the ideal possessions of the first one, that it is only by virtue of this further one that the soul lives in the complete wealth of its own kingdom. This essential life of the soul in another is, when expressed in terms of emotion, the inwardness of love.

We may consequently affirm *lave* to be the general content of the romantic, so far as the sphere of religion is concerned. Love, however, only receives its truly ideal configuration when it expresses the *positive* reconcilement of Spirit in its immediacy. Before, however, we shall be in a position to examine this stage of the fairest and most ideal spiritual satisfaction, we must first pass in review *the process of negation*, which the absolute Subject enters in overcoming the finiteness and immediacy of its human envisagement, a process which is divulged in the life, death, and suffering of God for the world and humanity, and its possible reconcilement with God. And, secondly, we have on the other side, humanity, which is called upon conversely on its own account to pass through the very same process in order to make actual the reconciliation which is implicitly contained in its nature. Midway within the steps of this process, in which the *negative* aspect of the sensuous and spiritual passage 011 to death and

the grave constitutes the central act of achievement, we shall find that the expression of *affirmative* blessedness is conspicuous, which in this sphere characterizes art's most beautiful creations. For the better division of this first chapter we may examine its subject-matter as it falls into three distinct heads of inquiry.

First, we have the redemption-history of Christ; the phasal moments of absolute Spirit presented in the person of God Himself, in so far as He becomes man, and takes to Himself an actual existence in the world of finitude and its concrete conditions, and in this to start with isolated existence gives visible shape to the Absolute itself.

Secondly, we shall consider love in its positive presentment as the feeling of reconciliation between the human and the Divine; in other words the Holy Family, the maternal love of Mary, the love of Christ and that of his disciples.

Thirdly, we have the community before us. Here it is the Spirit of God as present by virtue of the conversion of soul and the mortification of the natural and finite sense, in short, the return of man to God, a return in which penances and pains mediate in the first instance this union of God and man.

1. THE REDEMPTION-HISTORY OF CHRIST

The reconciliation of God with His own substance, history in its absolute significance, or, in one word, the process of realization, is made visible to our senses and assured to our minds by the revelation of God in the world. The content of this reconcilement as expressed in the most direct way is the coalescence in unity of the absolute essence of reality with the individual subject of human consciousness. An individual man is God and God is an individual man. In this truth is implied the fact that the human spirit *intrinsically*, that is, relatively to its notion and essence, is Spirit in truth;

and every particular individual in virtue of the humanity he connotes possesses the infinite vocation no less than the infinite significance of being an object of God and in union with God. But along with this and of a like importance the obligation is imposed on man to realize this notion, which, in the first instance, he merely possesses under the implication of his nature. In other words, he has to place before himself and attain to this union with God as the seal of his existence. Only when he has thus consummated his proper destiny does he become essentially free and infinite Spirit. This he can only do in so far as that unity is itself the origination, the eternal ground-root of the human and Divine nature. The goal is here the explicit beginning of the process, namely, the presupposition for the religious consciousness exhibited in romantic art, that God is Himself man and flesh, that He has become this particular human individual, in whom the reconciliation consequently no longer remains as only implicit, so that it is merely to be inferred from its *notional* existence, but asserts itself in *objective* existence also before the perception of human sense as this particular and actually existing man. The importance of this aspect of *particularity* consists in this that it enables all other individuals to find in the same the picture of his own reconcilement with God; it is now no longer a mere possibility, but a fact which has on this very account appeared as really accomplished in this one person. Inasmuch, however, as this unity, conceived as the ideal reconciliation of opposed factors of one process, is no immediately unified mode of being, it is inevitable, in the *second* place, that the process of Spirit as exemplified in this *one* individual — the process, that is, by means of which consciousness is for the first time Spirit in Truth — should receive the form of its existence in the history of this very person. This history of Spirit attaining its consummation in one personal life consists simply in all that we have already adverted to; that is to say, the particular man casts on one side his singularity both in its bodily

and spiritual presence, in other words he suffers and dies, but furthermore through the agony of death rises again out of death and ascends as glorified God, very and real Spirit, who now, it is true, has entered actual existence as this particular person, yet is with equal truth only very God as Spirit in His community.

(*a*) This history furnishes the fundamental material for the romantic art of the religious consciousness, in its attitude to which, however, art, taken simply as Art, is to some extent a superfluity. For the main thing here is spiritual conviction, the feeling and conception of this eternal truth, and *the faith* which is essential evidence to itself of the truth, and becomes in consequence a vital possession of the ideality of that conception. In other words, faith in its developed condition consists in the immediate conviction that it has confronting soul, in the organic movement of this history, the *truth* itself. If, however, the consciousness of truth is the main point of importance it follows that the *beauty* of the artistic reflection and presentation is of incidental value to which we may be comparatively indifferent, for the truth is present to mind quite independently of art.

(*b*) From another point of view, however, the religious content comprises at the same time within its compass a certain aspect of this process, by virtue of which it not merely admits of artistic treatment, but, in a specific relation, admits of it as *necessary.* In the religious conception of romantic art, as we have more than once explained it, it is an inseparable concomitant of the content that it carries anthropomorphism to the verge of an extreme; and this is so because it is precisely this content which possesses for its main *centrum* the complete coalescence of the Absolute and Divine with the human consciousness as a visible part of sensuous reality, in other words, as envisaged in the external bodily frame of man, and further, is compelled to represent the Divine in the form of individuality such as is associated with the deficiencies of Nature and the mode of finite phenomena. In this respect

Art supplies to the consciousness which seeks to envisage the Divine manifestation, the definite presence of an individual and real human figure, a concrete image, moreover, of the exterior traits of events, in which the birth, life, sufferings, death, resurrection and ascension of Christ are more widely circulated to the glory of God; so that it is exclusively by Art that the real and visible presence of the Divine is for ever renewed over again in a permanent form.

(*c*) In so far as, in this Divine manifestation, an emphasis is laid on this, namely, that God is essentially a particular individual to the exclusion of others, and does not merely present to us the union of Divine and human consciousness in its universal significance, but rather as that of this *particular* man, to that extent, the very nature of the content makes it inevitable that all the features of contingency and particularity incidental to finite existence assert themselves, from which the beauty which characterized the consummation of the classic Ideal had purified itself. That which the free notion of beauty had removed from itself as unfitting, in other words, the non-ideal, is in the present case accepted as a necessary aspect, which actually originates in the movement of the content itself and is consequently made explicit.

(*α*) And it follows from this that when the person of Christ is selected for the object of art, as so frequently occurs, artists, no matter when or where, have taken the very worst course of all who create in their presentment of Christ an Ideal in the meaning and mode of the classical Ideal. Such heads or figures of Christ may no doubt display earnestness, repose, and ethical worth: but the true Christ presentment should rather possess on the one hand soul-intensity and pre-eminently spirituality in its *widest* comprehension, on the other, intimate personality and *individual* distinction. Both these contrasted aspects are inconsistent with that blissful repose in the sensuous environment of our humanity. To combine these two *termini* of

artistic reproduction, expression and form, as above defined, is a matter of the greatest difficulty, and painters especially have almost always got themselves into difficulties when they diverged from the traditional type[225].

Earnestness and depth of consciousness should no doubt be prominent in the expression of such heads, but the specific features and lines both of countenance and figure ought as little to be of a simply ideal beauty as they are entitled to fall short in the direction of the commonplace and the ugly, or erroneously to aspire after the bare pretensions of the Sublime. The truest success in respect to the external figure will be found in a mean between the directness of Nature's detail and the ideal of beauty. Rightly to hit on this just mean is difficult. It is pre-eminently in this that the ability, taste, and genius of an artist will assert itself. And in general we may assert that in all artistic execution of this character — putting on one side entirely the different nature of the content, which is inseparable from religious faith — there is more scope offered for the exercise of the artist's private judgment than is the case when dealing with the classic Ideal. In classical art the artist seeks to present the spiritual and Divine immediately in the lines of the bodily shape itself, in the organism of the human figure; the lines of the human form, therefore, in this ideal divergence from what is ordinarily met with in finite existence, are fundamentally necessary to the interest. In the kind of art we are now discussing the configuration remains that of ordinary experience; its specific lines are up to a certain point unessential, detail, in short, that may indifferently be treated in divers ways and with greater artistic licence. The supreme interest, therefore, is concentrated, on the one hand, in the mode and manner whereby our artist makes that which is spiritual and ideal within the content under the mode of Spirit itself shine forth through this envisagement of ordinary experience; and, on the other hand, in the individual discretion exercised in the execution, the technical means and shifts employed, by virtue of which he is able to impart to his

creations the breath of spiritual life and to bring home this finer essence to our hearts and senses.

(β) With regard to the further aspect of the content we have already pointed out that it is referable to the history of the Absolute under the mode that the same is deducible from the notion of Spirit itself; a history which makes objective in the real world bodily and spiritual singularity as infused with its own essential and universal nature. For the reconciliation of our individual consciousness with God does not immediately appear as an original harmony, but rather as a harmony which only is modulated from infinite pain, from resignation, sacrifice, and the mortification of the finite, sensuous, and particular. We see here the finite and the infinite brought into unity; and this reconciliation only asserts itself in its true profundity, intimacy, and power by means of the grossness and severity of the contradiction which yearns for resolution. We may therefore without fear assert that the entire asperity and dissonance of the suffering, torture, and agony, which such a contradiction brings in its train, is inseparable from the very nature of spiritual life, whose final consolation constitutes here the content.

This process of Spirit is, if accepted frankly for all it implies and unfolds, the essence, the notion of Spirit absolutely. It consequently determines for conscious life that *universal history*[226] which is for ever repeated in every individual consciousness. For it is nothing less or more than this consciousness as the universal mind or Spirit is explicated in the multiplicity of individual life, reality and existence. In the first instance, however, for the reason that the essential significance of the spiritual process is concentrated in that mode of reality which is purely individual, this universal history comes before us itself merely in the form of *one* person, to which it is conjoined as its own, as the history, that is, of his birth, his suffering, death, and return from death; at the same time there is

the further significance attached to this personal history, namely, that it is the history of universal and absolute Spirit itself.

The supreme turning-point of this life of God is the putting aside of individual existence as the life of a *particular* man simply — the story of the Passion, the suffering on the Cross, the Calvary of Spirit, the agony of death. In so far as the content here comprises the fact that the external and bodily form — immediate existence in its personal mode — is, in the pain of its inherent contradiction, propounded in this aspect of negation in order that Spirit may secure its truth and its blessedness by the sacrifice of the sensuous and its individual singularity, to that extent we reach the extreme line of division between it as an artistic creation and the classic or plastic Ideal. From one point of view no doubt the earthly body and the frailty of human Nature is expressly exalted and honoured in the fact that it is God Himself who is made manifest within it. On the other hand, however, it is just this human and bodily side which is posited as negative, and declares itself in its pain. In the classic Ideal the undisturbed harmony in no way vanishes before the co-essential Spirit. The main incidents of that Passion, the mocking of Christ, the crowning with thorns, the carrying of the cross, the final death on the same in the agony of a torturing and tedious death, are wholly incompatible with the presentment of the Greek type of beauty. The lofty aspect in such situations as these is the essential holiness implied in them, the depth of the Spirit's inmost, the eternal significance of the agony in its relation to the spiritual process, the endurance and Divine repose.

The personal environment of this sublime figure is in part composed of friends and in part of enemies. The friends are throughout no ideal creations, but relatively to the notion[227], particular individualities typical of ordinary men, which the impulse of Spirit attaches to Christ: the enemies, on the other hand, by virtue of the fact that they place themselves in hostility to God, judge, mock, put to torture, and crucify Him, are presented

to us as spiritually evil, and this conception of their wickedness of heart and enmity to God brings in its train on its exterior side ugliness, grossness, barbarity, the rage and distortion of Spirit. In all these respects, in contrast with the classical beauty we have before us in such representations the non-beautiful as an inevitable concomitant.

(*γ*) The process of death, however, in the Divine nature is only to be regarded as a point of transition, by means of which the self-reconcilement of Spirit is effected; and the aspects of the Divine and human, the out and out universal and the phenomenal individuality, to mediate the division of which is the main object in view, are positively suffered to coalesce. This positive affirmation, which is the underlying root and origination of the process, is consequently also forced to exhibit itself in a like positive way. As emphatic situations in the Christ-history the resurrection and ascension supply conspicuously the very means to put that affirmation in the clearest light. In more isolated fashion we have over and above this for the same purpose those occasions in which Christ appears to His own as teacher. Here, however, plastic art is confronted with an exceptional situation of difficulty. For in a measure it is Spirit in its purity, which is to be presented in this very impalpable ideality, and in a measure, too, it is nothing less than absolute Spirit, which in the full pregnancy of its infinitude and universality is affirmatively propounded in union with an individual consciousness and exalted above immediate existence; and yet notwithstanding such preconceptions it has undertaken the task to envisage for sense in the bodily configuration of this person the entire expression of the infinite and innermost spiritual profundity which it refers to him[228].

2. RELIGIOUS LOVE

Mind in its ultimate and most complete explication as reason is, as such, not the immediate object of art. Its highest and most essentially realized reconciliation can only find such satisfied consummation in the intellectual medium as such, that is to say, the ideal medium which is withdrawn from the reach of artistic expression; for absolute Truth stands on a higher level than the show of beauty, which is unable to break away from the sensuous and phenomenal. If, then, Spirit is to receive an existence as *Spirit* in its positive reconciliation through the medium of art, an existence which is apprehended not merely as ideal, in other words, as pure thought, but can be *felt* and *envisaged*, it follows that the only mode left to us, which supplies this two-fold condition of spirituality on the one hand and of its capability of being conceived and presented by art on the other, is that of the inner realm of Spirit itself, what we understand by the soul and its emotional experience. And the condition of that kingdom which alone fully answers to the notion of free Spirit brought into peace and joy with itself is *Love.*

(*a*) In other words, if we look at the content, we shall see that its articulation is in its important features similar to the fundamental notion of absolute Spirit, the return of a reconciled presence from its Other to itself. This Other in the sense of the Other, in which Spirit continues by itself, can only be itself something spiritual, or rather a spiritual personality. The true essence of love consists in the surrender of the self-consciousness, in the forgetting oneself in another self, yet for all that to have and possess oneself for the first time in this very act of surrender and oblivion. This mediation of Spirit with itself and surcharge of its own to the unit of totality is the Absolute, not, however, of course, under the mode in which the Absolute coalesces with itself as merely singular and thereby finite individuality in another finite subject; rather the content of the spiritual individuality which is here self-mediated in another is the Absolute itself. It is, in short, Spirit which is only the knowledge and volition of its own substance as the

Absolute by being in another, and which receives therewith the fruition of such knowledge.

(*b*) More closely regarded this content as love has the form of self-concentrated emotion, which, instead of making its content more explicit, that is to say, presenting it to consciousness in its definite terms and universality, rather converges the infinite breadth of the same directly to one focus in the clear profundity of the soul, without further unfolding in other directions for the imagination the wealth which it essentially includes. By this means a content of equal significance, which would be inconformable to artistic presentation, is fresh from the mint of its pure and ideal universality, is none the less capable of being the subject-matter of art in this individual existence of subjective emotion; for while under a mode such as this it is not on the one hand compelled to accept an articulation of perfect clarity by reason of its still undisclosed depth, which is the obvious characteristic of soul-life, yet on the other hand it receives under this mode a medium that it is possible for art to make use of. For soul-life, heart, feeling, however self-contained and spiritual they may remain, have none the less a bond of affiliation with the sensuous and material, so that they are able also on the outside show of things through the bodily members themselves, through a look, the facial expression, or in a still more spiritual way through the voice tones or a word to disclose the inmost life and existence of Spirit. But this exterior medium is in such a case only acceptable in so far as it strictly expresses this most intimate life of soul in ways that reflect the inward nature of the soul itself.

(*c*) We defined the notion of the Ideal to be the reconciliation of the inward life with its reality; we may now in like manner point to the emotion of love as *the Ideal* of romantic art in the sphere of the religious consciousness. It is *spiritual* beauty in its pure emanation. The classic Ideal

also exhibited the mediation and reconcilement of Spirit with its Other. But here the opposing factor of Spirit was the exterior medium suffused with that Spirit, it was its bodily organism. In love, on the contrary, the opposing presence of that which is spiritual is not the phenomenon of Nature, but a spiritual consciousness itself, another subject of such; and the realization of Spirit is consequently effected by Spirit itself in its own kingdom, in that medium which is uniquely its own. It follows from this that love in this its positive self-fruition and essentially tranquillized and blessed realization is ideal, but before everything else *spiritual* beauty, which can only be expressed for the sake of the ideal virtue it possesses and further only in and as a part of the inmost shrine of the soul. For that Spirit, which is present in *spirit* to itself and is immediately aware of its own, which withal possesses what is spiritual for the substance and bottom of its very existence, abides in intimacy with itself, and, best definition of all, is the inward being of Love.

(α) God is Love; and consequently it is this most profound essence which, in this form native to artistic presentation, is thus apprehended and presented in the person of Christ. Christ is, however, *Divine love* in the sense that from one aspect of it declares God Himself as its object, that is, God in the mode of His invisible essence, and from another it as truly reveals humanity under the seal of its redemption; and for this reason it is not so much in Him[229] that the passage of one individual into another particular individual is made manifest in His love, as the fact that we have here the *idea* of Love itself in its universality, in other words, the Absolute, the spirit of Truth in the medium and mode of emotion. With the universality of its object the expression of Love is also universalized in pursuance of which the purely individual concentration of heart and soul is not made the important point, just as among the Greeks in the ancient Titan Eros and Venus Urania we find, though, of course, in an entirely different connection, that it is the universal idea rather than the individual side of

personal form and feeling which is the factor emphasized. Only when Christ is, in the presentation of romantic art, rather conceived as at the same time the isolate self-absorbed personality himself, is the expression of love clothed in the form of individual inwardness, and even then it is, of course, always exalted and uplifted by the universality of the content.

(β) The kind of love, however, which in this sphere of art is most within its reach and is generally the most successful object of the romantic and religious imagination, is the love of Mary, the mother's love. It stands closest to Nature's reality, is very human, and yet entirely spiritual, without either the interest or the egotism of sensual desire, not sensuous and yet present inward bliss in its absolute condition of fruition. It is a love that has no longing in it, not friendship, for friendship, albeit also so rich in soul quality, requires a substantive content, an essential material as the associating object. A mother's love, on the contrary, possesses without any mutuality[230] of aim or interests an immediate basis in the natural maternal bond. But in this particular case the mother's love is just as little restricted to the purely natural affiliation. Mary possesses in the child which she has carried under her heart and borne with travail the perfected knowledge and feeling of her very self, and this selfsame child, the blood of her blood, is also in equal degree exalted above her, and yet for all that she is conscious that this higher belongs to herself, and is precisely that she gains in her act of self-oblivion and possession. The natural intimacy of the mother's love is absolutely spiritualized, it receives for its very embodiment the Divine; but this spiritual coherence remains lowly and unaware, permeated in a wonderful manner with the unity of Nature and the emotion of womanhood. It is the *blessed* mother's love, and pertains only to the *one* mother, who first was recipient of its joy[231]. It is quite true that even this love is not without its pain, but the pain is merely the grief of loss, the lament over the suffering, dying, and dead son, and, as we shall find it at a later stage[232], has

nothing to do with the injustice and torture suffered from a force without, or with the infinite conflict with sin, still less with agonies and pangs that arise in the soul. The inwardness of soul such as we have analysed is the beauty of Spirit, the Ideal, the human identification of man with God, with Spirit, with Truth; oblivion in its pure selflessness, the surrender of the ego, which, however, in this surrender, is from beginning to end at unity with that in which it is absorbed, and it is in this coalescence that the feeling of blessedness is consummated.

Under such a fair aspect we have maternal love embodied in romantic art, and it is at the same time a picture of Spirit itself, because Spirit is only apprehensible by art in the form of feeling; and the feeling of that union of the individual with God in its most original, most real, and most vivid form is only present in the mother's love of the Madonna. It must inevitably form the subject-matter of art, if in the representation of this, the sphere of the religious imagination, the Ideal, the affirmative reconciliation in its joy is not to fall short of its aim. There has consequently been a time when the maternal love of the Blessed Virgin has been placed as the highest and holiest of Earth's possessions, and as such has been revered and presented to mankind. When, however, Spirit is brought before the human consciousness in its own native element, separated, that is, from all underlying emotion, the free mediation of Spirit that is built up on such a foundation can alone be regarded as the free road to Truth; and consequently we find that in Protestantism, as contrasted to this worship of Mary whether in art or belief, it is the Holy Spirit, and the inmost mediation of Spirit which has become the loftier truth.

(*γ*) *Thirdly*, and in conclusion, the positive reconciliation of spiritual life is embodied in the feelings of Christ's own disciples, the women and friends who follow him. Such are for the most part characters who have personally taken on themselves the severity of the idea of Christianity, hand

iii hand with their Divine friend, by virtue of the friendship, teaching, and sermons of Christ, without passing through the external and inward pangs of spiritual conversion, who have carried it forward, made themselves masters both of it and themselves, and in the depth of their hearts remain strong in the same. From such, no doubt, the immediate unity and intimacy of that mother's love in a measure vanishes; but they still possess as the bond which unites them the presence of Christ, the common service to a great life which they share, and the direct impulse of Spirit[233].

3. THE SPIRIT OF THE COMMUNITY

In making our passage over to a concluding stage of the subject under discussion we can hardly do better than associate it with that which we have already touched upon in connection with the history of Christ. The immediate existence of Christ, as this particular man, who is God, is assumed to be wiped out, in other words, the truth itself asserts itself that in the manifestation of God as man, the true reality of God thus envisaged is not immediate sensuous existence but Spirit. The reality of the Absolute regarded as infinite subjectivity[234] is simply Spirit itself; God is in knowledge, in the element of the inner life, and only there. This absolute existence of God, as absolutely ideal to the same extent as it is subjective[235] *universality*, does not therefore admit of the limitations of this particular individual, who has in the story of his life made manifest the reconciliation between the Divine and human self-consciousness, but on the contrary is enlarged to the full measure of the human consciousness which is reconciled to God, that is, in general terms to our *humanity*, which exists as an aggregate of many individuals. In his independence, however, taken, that is, as a specific personality, man is not under any immediate mode the Divine, but on the contrary finite and human, which only in so far as it really propounds itself as a negation, which it essentially is, and thereby

annuls itself in this negative aspect, can attain to the reconcilement with God. It is only by virtue of this deliverance from the frailty of finitude that our humanity declares itself as the vehicle of the existence of the absolute Spirit, as the spirit of the community, in which the union of the human and Divine Spirit within the bounds of human reality itself, in the sense of its realized mediation, carries into fulfilment what essentially, if we look at it in the light of the notion of Spirit, it is from the first in that very union.

The principal modes which are of importance in respect to this new content of romantic art may be distinguished as follows:

The individual, who in his separation from God lives in a condition of sinfulness and conflict with the immediacy and frailty of finite existence, possesses the eternal destiny to come into reconciliation with himself and God. Inasmuch, however, as we find that in the redemption-history of Christ the negative relation of immediate singularity is affirmed and declared an essential feature in the spiritual process, so, too, every particular individual is only through a conversion from the natural state and his finite personality uplifted to the free condition and into the peace of God.

This abrogation of finitude asserts itself in a threefold manner as follows:

First, as the repetition in *actual life* of the history of the Passion, a repetition of real bodily suffering — martyrdom.

Secondly, the above conversion is removed to the *inmost* life of soul, as spiritual mediation by means of repentance, penance, and conversion.

Thirdly, and finally the manifestation of the Divine is so conceived in the world of Nature's reality that the ordinary course of Nature and the natural mode of occurrences as they otherwise take place is arrested, in order to display the might and presence of the Divine. Wonder or miracle is consequently the form of presentation.

(*a*) *The Martyrs*

The earliest mode under which the spirit of the community makes itself actively present in the human consciousness is effected when man forms a mirror in himself of the Divine process and so makes himself a new form of existence for the eternal Life[236] of God. Here we find once more that the expression of that immediate and positive reconciliation disappears, inasmuch as man can only attain to this by abrogating his finite existence. Everything, therefore, that was of central importance in the first stage returns to us again here only in an aggravated degree, because the incompatibility and unworthiness of our humanity is here presupposed, and to remedy this defect is assumed to be man's supreme and unique duty.

(α) The specific content of this phase is consequently the endurance of torments, and along with such the individual's willing renunciation, sacrifice, and self-imposed renunciation with the express aim of arousing sufferings, tortures, and anguish of every kind in order that Spirit may reveal itself therein, and feel itself in union with the fruition and blessedness of its heaven[237]. The negative aspect of pain is an object in itself for the true martyr, and the greatness of the revelation is such that it can treat with indifference the awful aspect of that which man has thus suffered, and the dreadful nature of that to which he submits himself. The first thing, then, which will be brought beneath the ruthless mace of negation in order that the individual who still experiences this drought of the soul may wean himself from the world and become sanctified, will be his *natural* existence, his life, the satisfaction of the most essential necessaries of his bodily existence. The main subject-matter therefore of the type we are now dealing with will be torments of the body, sufferings which have been perpetrated on the believer either by his enemies and persecutors out of hatred and persecution, or have been deliberately accepted by himself on principle by way of expiation. In both cases the individual accepts them in the full fanaticism of his readiness to endure, not, that is to say, as an injustice to

himself, but as a blessing through which alone he is enabled to break down the walls of what he feels to be his sinful flesh, heart, and soul, and so obtain reconcilement with his God.

In so far, however, as this conversion of the soul can only manifest itself in such situations, in atrocities and awful treatment of the bodily frame the beauty of the presentation of such subjects may be very readily impaired; and, in fact, we may say that the treatment of all subjects of this kind is a perilous undertaking for art. For, on the one hand, it is obvious that individuals here, impressed as they are wholly with the hall-mark of finite existence, and its inevitable blemishes and defects, will have to be represented in an entirely different atmosphere from that we claimed for the history of Christ's Passion; and, from a further point of view, we unfortunately meet with unheard of agonies and horrors in such cases, distortion, and dislocation of limbs, bodily torments, scaffolds, decapitation, burning or roasting in oil, flaying alive, and every other sort of frightful, repugnant, and loathsome abuse of the body, such as lie much too remote from beauty for any sane art to think of selecting them for its subject-matter. The artistic dexterity of the artist may, in such cases, no doubt, so far as execution is concerned, be of the highest class; but, at best, such manual dexterity will merely possess a personal interest, we may indeed find before us the technique of an admirable painter; but it will be equally obvious that all his efforts have been unable to produce out of such material a harmonious work of art.

(*β*) For these reasons it will be necessary that the artistic presentation of this negative process should emphasize another aspect of it, which stands out thereby above this agony of the body and soul, and establishes in relief the positive presence of reconciliation. This is just that essential reconcilement of Spirit which is finally won as the result sought for of the pain suffered. Under an aspect such as this the martyrs may be depicted as

the guardians of the Divine in conflict with the grossness of material force and barbarism of unbelief. For the sake of their heavenly treasure they endure pain and death, and this courage, steadfastness, endurance, and consolation must consequently, with equal truth, appear upon them. And yet for all that this intimate possession of their faith and love in its spiritual beauty is no sanity of soul which brings to them a sense of the sanity of their body; rather it is a sense of inward life, which has worked its way through their pain itself, or at least is made manifest in their suffering, and which, even in the moment of their ecstasy, retains the experience of pain as an essential condition of their beatitude. The art of painting has, in particular, made this attitude of saintly humiliation the object of its efforts. What this art mainly should strive after here is to delineate the bliss of such torments in the pure and simple lines of the countenance and its expression, as contrasted with the offensive laceration of the flesh; and to present such an ecstasy as may reflect the surrender and victory over pain, the fruition, in short, of the Divine Presence in the temple of the soul. If, on the contrary, the art of sculpture seeks to give a visible form to such a content, it will inevitably find itself less qualified to depict this ecstasy of soul-life at this strain of its intensity with such a concentrated power, and will consequently be compelled to emphasize that aspect of pain and laceration in so far as it declares itself in its full force on the bodily frame.

(*γ*) *Thirdly*, it is to be observed that in the kind of examples with which we are now dealing it is not merely the existence of Nature and immediate finite conditions which is affected by this attitude of self-abnegation and endurance, but the impulse of the soul is transported by such feelings to an extreme point of this heavenly rapture to such an extent, in fact, that what is merely human and of the world, even when it is essentially beyond reproach on ethical or rational grounds, is none the less thrust behind and scorned. In other words, just in proportion as the Spirit, which here makes vivid to itself

the idea of its conversion, is in the first instance deficient in an educated sense, to that extent it will with so much the more uncontrollable and logical frenzy — the entire force of its piety being concentrated on this one object — turn its back on everything which as finite opposes this bare and abstract infinitude of its religious fanaticism, that is to say, on every definite human emotion, all the manifold ethical impulses, relations, and obligations of the heart. For the moral life of the family, the bonds of friendship, of blood, of love, of the State, and a man's calling, every one of them belong to the things of the world; and all that is of the world, in so far as it is not as yet suffused with the absolute conceptions of faith and developed in unity and harmony with the same, appears to this form of abstract spiritual intensity of the soul of faith so far from being something acceptable to its emotional life and sense of obligation, that it is, on the contrary, a thing of no worth at all, and therefore both hostile and hurtful to its religious state. The moral organism of the human world is consequently not as yet respected, because its significant features and duties are not as yet recognized as necessary, integrated members in the concatenation of an essentially rational reality, in which nothing, it is true, ought to assert itself in a one-sided and independent isolation, yet, none the less, as an essential factor in the organic process, must be maintained as such and not be sacrificed. In this respect the religious reconciliation remains itself *one-sided*, and declares itself in the truly simple heart as an intensity of belief which is deficient in comprehensiveness, that is, as the piety of the self-secluded soul, which has not yet attained in its growth to the fully expanded self-reliance of maturity, and to conviction based on genuine insight and circumspection. When the force of a soul deficient in these qualities maintains its opposition to the world which is thus treated in a purely negative way, and forcefully breaks loose from all human ties, even though they may originally be the very closest, we can only characterize such

conduct as the rawness of Spirit and a barbaric result of the power of abstraction, which is simply repulsive. So we may say that though from the point of view of the religious consciousness, as we find it to-day, it is indeed possible to honour, and to honour highly, this opening germ of religiosity in such representations, if, however, such a pious tendency proceeds to such lengths that we find it advancing to lay siege to what is both essentially rational and moral, then, so far from sympathizing with such a fanaticism of sanctity, we can only protest that a kind of abnegation such as this, which casts off from itself, shatters and treads upon that which is independently justifiable, and even sacred, appears to us both immoral in itself and subversive of the very type of religion it represents. There are many legends, tales, and poems which deal with this extreme form of the pious craze. We have, for example, the tale of a man who, though full of tenderness for his wife and family, and, moreover, beloved by all his friends, leaves his home and makes a pilgrimage. When at last he returns home in the guise of a beggar he refuses to disclose his identity. Alms are given him, and out of compassion a permanent lodging provided under the stairs. In this plight he lives for twenty years; he sees the grief of his family on his account, and only declares who he is on his death-bed. This kind of thing, which we are asked to revere as sanctity, is, of course, merely the egotism of a fanatic which revolts us. This long endurance of renunciation may remind us of the distrait nature of those penances, which the Hindoos voluntarily impose on themselves on religious grounds. But the endurance of the Hindoo has a very different significance. In that case a man deliberately places himself in a condition of vacuum and unconsciousness; in the case which we are now considering the *pain*, and the deliberate consciousness and feeling of the same is the real object, which it is assumed will be attained with just so much more purity as the suffering is associated with the consciousness of the value of and devotion to the severities which

are accepted, and is, moreover, united with a vision for ever concentrated on the renunciation thus made. The richer the heart which takes on itself the burden of such ordeals, the nobler the content of its own possessions, and yet withal believes that it is bound to condemn them as of no merit, just so much the more difficult grows the task of reconciliation, and the more prone it is to bring about the most terrible convulsions and the most raving distraction. Indeed, to our vision, it is clear enough that a soul such as this, which is only at home in a world which, however full of ideas, is not the world of common experience, and which consequently only feels its grasp slipping from the stable and paramount centres of activity and aims of this our actual world, ay, and although it be with heart and soul held in and associated with that world, yet regards all that is moral there simply as something which contradicts its absolute destination — we can only say that such a soul, both in its self-inflicted sufferings and its renunciations, is from the rational point of view simply mad, so mad that we can neither feel any profound compassion for it, nor propose any means of liberation. What is lamentably lacking to a mode of life of this kind is an object of real substance and valid significance; what it proposes to secure is an aim wholly personal, an object sought for by the individual for himself alone, for the salvation of his own soul, for his own blessedness. Few are likely to concern themselves very deeply whether an individual, at any rate one of this type, is or ever will be happy[238].

(*b*) *The inward Penance and Conversion*

The kind of representation, in the same general class of cases which we shall now contrast with the one above examined, turns aside from the extremity of merely bodily suffering, as it is also from a further point of view more indifferent to the purely negative impulse directed against what is essentially just and right in the actual conditions of the world; the

material of such representations consequently, both in respect to its content and its form, opens up a ground which is more conformable with ideal art. And this ground is the conversion of the *inner* life of the soul, which only here seeks to express itself in its *spiritual* pain, and its change of heart. Here, therefore, we find in the first place that we have no more of those ever repeated horrors and barbarities of pain inflicted on man's poor body: and, secondly, that which we have referred to as the barbarian religiosity of the soul no longer holds fast to its antagonism as against the purely ethical aspects of humanity in order to trample under iron foot in the abstraction of its purely conceptive satisfaction[239], and in the pain of an absolute renunciation that other kind of sensuous enjoyment; for the most part its attention is now solely directed against what is in fact sinful, criminal, and evil in human Nature. We find here a lofty assurance that faith, this spiritual impulse towards God, is capable of converting the past action, even though it be a sin or a crime, into something alien to the man who perpetrated it, washing it away in fact. This withdrawal out of evil, that wholly negative condition, which is realized in the individual by the subjective volition and spirit at once scorning and confounding itself under its former state of evil — this return to the positive which is now self-established as the only real in contrast to the former state of sinfulness, is the truly infinite content of religious love, the presence and actuality of absolute Spirit in the individual soul itself. The feeling of the stability and endurability of the personal existence, which through God, to which it addresses itself, triumphs over evil, and in so far as it is thus mediated with Him is aware of itself as one with Him, produces as its effect the fruition and blessedness of contemplating God, it is true, in the first instance as the absolute Other in His opposition to the sin inherent in finite existence, but further of knowing this Infinite Presence as identical with me as this particular person, of knowing, in short, that I carry this self-consciousness of God, as the seat of

my own personality, that is to say, my own self-consciousness, as certainly as I carry the sense of my own self-identity. Such a revolution takes place no doubt entirely within the shrine of the soul, and belongs, therefore, rather to religion than art: for the reason, however, that it is the intimate movement of the soul, which pre-eminently makes itself master of this act of conversion, and also is able to throw a gleam of light through the external embodiment, a plastic art such as painting can also claim to make visible the history of such conversions. If it attempts, however, to depict the entire course of events which belong to such a transition, much that is very far from being beautiful may readily appear in the result, because in such a case both that which is sinful and repulsive requires to be depicted, as, for example, in the story of the prodigal son. Painting, therefore, achieves its greatest success when it concentrates the act of conversion into *one* picture where that is the prevailing motive, and pays little or no attention to the previous course of events. The ordinary presentations of Mary Magdelene may be noted as an admirable example of this kind of work, and particularly in the hands of the old Italian masters has been treated in a way both excellent in itself and throughout consistently with fine Art. She is depicted here both in the characterization of her soul and her external presence as the *fair sinner*, in whom the sin no less than the sanctity is intended to exercise a sort of fascination on the spectator. But at the same time neither sin nor sanctity are treated with any great intensity. She is forgiven much because she has loved much, and her forgiveness is in a measure the portion both of her love and her beauty. And what affects us most of all in this picture is this, that she makes for herself a conscience as it were out of her love, and robed in the beauty of her sensitive soul pours forth her sorrow in a flood of tears. We are not led to feel that the fact that she has loved so much is her error, but rather that her fair and fascinating folly is this, namely, that she

believes herself to be a sinner,[240] for her exquisitely sensitive beauty only leaves us the impression that in her love she is both noble and profound.

(*c*) *Miracles and Legends*

The final aspect, which is closely associated with the two above considered, and is frequently asserted as a concomitant of both, is that of miracle. It plays in fact an important part throughout this stage of our inquiry. In this connection we may define miracle as the conversion-history of the immediate existence of Nature. Such reality lies before us as a commonplace, contingent existence. This finite substance is touched by the hand of God, which, in so far as it strikes upon what is purely external and particular, breaks it up, transmutes it into something entirely different, interrupting what in ordinary parlance we call the natural course of things. To bring before us the soul arrested by such inexplicable phenomena, in which it imagines it recognizes the presence of the Divine, vanquished, in short, in its ordinary view of finite events, this is the main subject-matter of a host of legends. In fact, however, the Divine can only touch and dominate Nature as Reason, that is, in the unalterable laws of Nature herself, as implanted therein by God, and the Divine has no occasion to exploit Himself in the supreme sense of this term in particular circumstances and modes of causation which run contrary to these laws of Nature, for it is only the eternal laws and determinations of reason which apply in any real sense to Nature. From another point of view legends frequently carry with them quite unnecessarily an amount of matter which is abstruse, out of taste, senseless, and ridiculous, inasmuch as the intention is that both intellect and heart should be stimulated to believe in the presence and activity of God by precisely those things which are essentially irrational, false, and heathenish. The consequent emotion, piety, and conversion of the soul may even then awake our interest, but in that case it is only on the *one* side, namely, that of the soul: so soon as that enters into relation with somewhat else outside it,

and the idea is that this external correlative shall effect the conversion of the heart, then we inevitably require that such should not be wholly a meaningless and irrational sequence of events.

Such, then, would be the fundamental divisions of the substantive content at this particular stage of our inquiry, regarding that content as the self-subsistent Nature of God, or in its aspect as a spiritual process, through which and in which He is Spirit. We have here the absolute object, which art neither creates nor reveals out of itself, but which it has received from religion which it approaches with the conviction that it is *essentially* true that it may express and represent the same conformably to its modes. It is the content of the believing, yearning soul, which is intrinsically the infinite totality itself, so that for it the external medium remains to a more or less degree outside it, or a matter of indifference, and is unable to be brought completely into harmony with that inner life. And for this reason it frequently presents a repellent material which art finds itself unable wholly to subdue to its aims.

[224] *Nicht aufnehmend.* Not ready to absorb extraneous matter.

[225] This of course is an opinion which may be strongly contested in its application to particular artists.

[226] Hegel means not so much the history in which the whole totality of events is comprised as that aspect of human history which declares its universal significance as infinite spirit.

[227] That is, of self-consciousness in all that it implies — the personality of Christ, for example.

[228] Hegel does not further dwell upon this relativity. But the next paragraph explains what is really in his mind. The important question, however, how far such events are worthy of credence as objective history, to say nothing of the inadequacy of their artistic presentation, one cannot but feel is deliberately evaded. What Hegel would say no doubt was that the

bare historical aspect was only of relative importance. The main question was their significance in the spiritual process. It is in this direction that much of our noblest modern thought finds a certain indissoluble unreality of statement.

[229] That is in Christ.

[230] *Gleichkeit.* Equality, reciprocity.

[231] We are reminded of our treasures in Christian art such as the Virgin and Child in Tintoret's "Flight into Egypt," Rafael's San, Sisto Madonna and the rest.

[232] In other words as regarded at a later date by the Church.

[233] This statement hardly does justice to the profound idealism of the epistles of St. Paul.

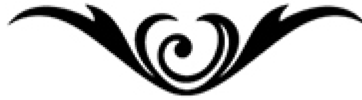
[234] Perhaps "the infinite form of subjectivity" is better. He means "the infinite form of individual self-consciousness."

[235] That is, characterized by personality.

[236] *Geschichte.* Life as an evolved Process.

[237] Compare the poem of Meredith, "Theodolinda," in his ballads of the Tragic Life. It is, in another aspect, that iron crown which that thoughtful contemporary writer, Mr. H. W. Nevinson, refers to in his Essays on Rebellion.

[238] The elimination even of sympathy with such fanaticism where it is quite sincere, a rare case no doubt, seems severe. The best illustration in modern literature I know of the principle "all or nothing," is Ibsen's great drama "Brandt." Readers of Carlyle will doubtless recall from "Past and Present" and elsewhere that prophet's repeated denunciations of the craze for personal happiness.



[239] By *intellectuellen Befriedigung* Hegel does not mean "intellectual" in a good sense, but merely that the man imagines his happiness in his mind

rather than feels it through the senses. The psychology of religious ecstasy, however, is a rather involved problem.

[240] This analysis is rather surprising. Did Hegel, the robust Swabian, really think the above the finest type of art's presentations of the Magdalene? Does it not lean very closely to that soft sentimentalism which a Carlo Dolci gives us in its decadence? At any rate the idea that the Magdalene was not really a sinner flatly contradicts the original references to her in the gospels, and to my mind at any rate seems from the artistic point of view also to destroy half the rare beauty of her repentance. The principle of such an interpretation is surely the entirely pagan one, whether Greek or French, that a great passion is its own justification quite irrespective of moral considerations. She is the historical impersonation of the frailty of a love too dependent on the senses, not of one in which either nobility of bearing or extreme selflessness is conspicuous. Hegel's analysis may be true enough of certain pictures — but do they really present us the ideal; most assuredly not.

CHAPTER II

CHIVALRY

THE PRINCIPLE OF the essentially infinite subjective consciousness possesses for the content of faith and art in the first instance, as we have already discovered, the Absolute itself, in other words the Spirit of God as it is mediated and reconciled with the conscious spirit of man and thereby is first itself independently free. This romantic mysticism in its self-limitation to the sense of blessedness in the Absolute Presence remains a mode of spiritual inwardness which is abstract, because it confronts the things of the world in opposition and rejects the same. Faith is, in an abstraction of this kind, alienated from life, from the concrete reality of human existence, removed from the positive relations of mankind to one another, who only know and love each other in faith, and for the sake of their belief as completely bound together in yet a third association, namely, the spirit of the Christ community. This association is alone the clear spring in which the image of that blessedness is reflected, without it being necessary for man to look his brother first in the face, to enter into any direct relation with another, or to experience the unity of love, of trust, of confidence, of mutual aims and actions in contact with the living concrete presence. That which constitutes the hope and yearning of the inner life man here, in this sense of exclusive religious intimacy, can only discover as actual life in the kingdom of God, in the society of the Church. He has not as yet[241] withdrawn this single identity in a third factor from his conscious life in order that he may possess all that he is really himself in his entire spiritual concreteness no less before his eyes directly in the knowledge and volition of that other

whole. The collective religious content, it is true, assumes the mode of real existence, but it is still an existence which is located in the ideal world of an imagination which consumes the expanding boundaries of actual life. It is still far away from attempting to satisfy its own life also in that abundance which it receives from the world and its realization in the world as the higher demand in the medium of life itself.

It follows that the soul which found its initial consummation in the simple feeling of Divine blessedness must step forth from this heavenly kingdom peculiar to the *religious* sphere, must undertake the effort of self-introspection and assimilate a content which is, as vitally present, adequate to the demands of the individual consciousness in its fullest extension. And in this process that which was before a *religious* coalescence of soul is changed to one of *secular* type. Christ indeed said; "Ye must leave father and mother, and follow Me." And in the like spirit: "Brother shall hate brother; men shall crucify you and persecute you." But as soon as the kingdom of God has secured a foothold in the world, and is actively employed in transfusing with its spirit and illumining the aims and interests of that world; when father, mother, and brother are already numbered in the community, then the things of the world on their side commence to assert their just claim to recognition and furtherance. If this claim is not merely fought for but vindicated then also the negative attitude of the religious spirit, which was at first exclusively hostile to all that was merely human, vanishes; the spirit of man enlarges, it explores the full scope of its actual presence, and unfolds its heart in the entire world of reality[242]. The fundamental principle suffers no alteration; the substantive and infinite self-consciousness merely directs its attention to another province of its own kingdom. We may perhaps define this transition in the statement that the individual singularity is now as such singularity independent of its mediation with God and self-subsistently free. For precisely in that

mediation, whereby it divested itself of its purely finite limitation and natural life, it has passed over the path of mere negation, and reappears after having thus secured an essentially *affirmative* position, in the condition of a consciousness that is free and as such makes the demand that it shall, in virtue of its own infinitude, though the infinitude is here only in the first instance one of pure form, secure complete recognition both for itself and others. In this the religious mode of the individual consciousness is reposed the entire spiritual wealth of the infinite soul, which it has hitherto filled up with God. If we, however, made the inquiry, of what material the heart of man is suffused in this its inward repletion, such a content merely concerns the infinite relation of the subjective consciousness in its active self-relation; it is simply replete with its own formal medium, that is, as essentially infinite singularity without further and more concrete expansion and significance as a content of interests, aims, and actions which is itself essentially objective and substantive[243]. If we further examine the matter, however, more closely we shall see there are in the main *three* emotions, which in their independence rise up in the individual soul to the level of this infinite mode, namely personal *honour, love*, and *fidelity.* They are not so much moral qualities and virtues as simply modes which inform the intimate presence of the individual soul when fulfilled with its own self-relation as such is recognized by romance. For the personal self-subsistency for which *honour* contends does not assert itself as intrepitude on behalf of a communal weal, and the repute of thoroughness in relation to it and integrity of private life. On the contrary it contends simply for the recognition and formal inviolability of the individual person. The same principle applies to *love*, which forms the central subject-matter of this sphere. It is merely the adventitious passion of one individual for another; and however much it may expand under the wand of imagination or may be deepened by excess of emotion, it is for all that neither the ethical relation

of marriage or family. *Fidelity* possesses no doubt more the appearance of a moral character, inasmuch as it does not merely will its own but holds fast to something higher, something shared with itself, surrenders itself to another's will, whether it be the wish or behest of a master, and thereby renounces the personal desire and independence of its own particular volition. But the feeling of loyalty does not concern the objective interest of the social weal in its independent form, that is, in the concrete freedom of the developed state life, but associates itself merely with the *person* of a master, who, in his own fashion, acts with independence, or concentrates himself in more general relations and is active on their behalf[244]. These three modes of feeling taken together and as they reciprocally affect one another constitute with the exception of the religious relation, which also has its part to play here, the principal content of *chivalry*, and furnish the necessary steps of advance from the principle of purely religious enthusiasm to the entrance of the individual soul into the concrete social life of the world, in the kingdom of which romantic art now secures a platform on which it can from its own resources work out its independence, and at the same time embody a freer type of beauty. It stands here, so to speak, in the free room midway between the absolute content of the independently stable religious conceptions and the varied particularity and restricted boundaries of the finite world. Among the various arts it is pre-eminently poetry which has shown itself most qualified to master such a material, its modes of expression being directed to the life of the soul as wholly occupied with its own domain and as realized in its aims and events.

Inasmuch as we now have before us a material which man takes possession of in his own spiritual life, or rather, from the world of his pure humanity, we might at first suppose that romantic art occupied the same ground as that of classic art. This, therefore, is an excellent opportunity for placing them together both in comparison and contrast. We have already

defined classical art the Ideal of humanity certified as true in its objective self-subsistence. Its imaginative vitality requires as its core a content which is substantive in type and excludes an ethical pathos. The Homeric poems, the tragedies of Sophocles and Aeschylus, are in the main concerned with interests of an absolutely factual content, an austere treatment of the passions reflected therein, a solid style of speech and execution in conformity with the nature of the ideas expressed, and above this domain of heroes and other figures which alone are in their individual self-concentration at home in such an atmosphere of pathos we have the realm of the gods at a still more advanced stage of objective presentment. Even in the case where art, in more introspective fashion, is occupied with the infinite experiments of sculpture, bas-reliefs and similar forms, or the later elegies, epigrams, and other diversions of lyrical poetry, we still have the same type before us, that is to say, the type which portrays the object more or less as it finds it, and obedient to the claim that it already has secured its constructive presentment. We have, in short, represented figures of the imagination already established and defined in their characterization such as Venus, Bacchus, or the Muses. It is just the same with the later epigrams, where we get the description of a material already to hand or, as in the case of Meleager, a posy of well-known flowers, bound together with the cords of exquisite feeling and taste. It is, in short, an exhilarating mode of activity carried on in a wealthily furnished house overflowing in its stores with every kind of bounty, image and provision for every conceivable object. The poet and the artist is simply the magician, who wafts them into use, collects and groups them.

It is wholly different in romantic poetry. In so far as it is of the world worldly, and is not directly associated with the story of our Lord, the virtues and objects of its heroism are not those of the Greek heroes, whose type of morality Christendom in its early days simply regarded as a brilliant

enormity. Greek morality presupposes the presence of humanity in its complete configuration, in which the volition then and there as it ought to act conformably to its essential notion of independence has received a definite content and the actual conditions of freedom imperatively valid such as belong to that content. Such are the relations of parents and children, married persons, or of citizens of city or State in the realized liberty of such. Now inasmuch as this objective content of human affairs belongs to the *evolution* of man's spirit on the basis of Nature cognized and insured as actual fact, it is unable any longer to satisfy that self-absorbed introspection of the religious life, which seeks to destroy the natural aspect of human life, and must deviate considerably from the virtue of humility which opposes it, and the surrender of human freedom and its staunch self-dependence. The virtues of Christian piety simply prove the death of such a world-attitude if held in their extreme of abstraction, and only make the individual free, when he absolutely denies the human part of him. The individual freedom of our present sphere is no doubt no longer conditioned by mere endurance and self-sacrifice but essentially positive in the world arena; that infinite self-relation of the individual has, however, as we have already discovered, the inward realm of the soul as its content and only that, the subjective soul, that is, whose movement is in its own peculiar medium, as the secular ground of its own domain. In this connection poetry does not draw from any objective material already presented it, no mythology, for instance, no imaginative pictures and embodiments, which already lie ready waiting for its expression. It stands there wholly free, without any extraneous matter, purely creative and productive. It is free as a bird that sings straight from its breast. It follows, then, if this subjective activity proceeds also from a noble will and a profound soul, we shall merely have in its workings and relations and existence the evidence of caprice and contingency, for the reason that freedom and its aims proceed, relatively to

a content which is throughout immaterial, from internal self-reflection. And, consequently, we do not find so much in individuals a particular pathos in the Greek conception of the term and a vital self-subsistency of character associated with it by the closest bonds, as that which is simply a grade of heroic conception in its connection with love, honour, bravery, and fidelity; a grade into which it is mainly the nobility or depravity of soul which imports the distinguishing features. The characteristic trait, however, which the heroes of the Middle Ages possess in common with those of antiquity is that of *bravery.* Yet even this receives a totally different complexion. It is not so much a natural courage, which reposes on the character that is sane and sound, and flows forth from the growth of an unimpaired robustness of body and will, assisting the execution of objective interests. Rather it is the outcome of the secret wealth of the soul, its honour and chivalry, and is in the main a creation of the phantasy, which undertakes adventures that have their origin in individual caprice and the chance intricacies of external circumstance or the impulses of mystical piety, and we may add generally the personal attitude of the individual.

This romantic type of art finds a home, then, in two hemispheres, in the Western world as this penetration into the more intimate shrine of Spirit, in the Eastern this its first expansion of the self-absorbed consciousness as it frees itself from the finite environment. In the West poetry reposes on a soul which is withdrawn upon its resources, which has become the centre of its activity, yet possesses this flavour of secularly merely as one part of its complexion, as one aspect, over which is superposed a yet loftier world of belief. In the East it is the Arab above all, who as a solitary,[245] who in the first instance has nothing before his eyes but his dried-up desert and his heavens, stands forth in the full strength of life as the proclaimer of the splendour and primary extension of the world of Nature, and thereby still preserves at the same time the freedom of his soul. And generally we may

say that in the Orient it is the Mohammedan religion, which has cleared the ground, made an end of all idolatry in the service of finite things or the imagination, and given the soul at the same time the personal freedom, which wholly floods the same, so that the secularity does not here only constitute another province, but runs beyond it into the universal licence, where heart and mind, without ascribing any objective reality to God, find their reconciliation in the jubilant lust of living just like beggars by throwing the glory of their fancy on the objects around them: enjoy their loves and are happy, blessed, and contented.

1. HONOUR

The motive of honour was unknown to ancient classic art. In the "Iliad" it is quite true that the wrath of Achilles constitutes both the content and the motive principle, so that the entire series of events is dependent upon it; but what we moderns understand by the term honour is not grasped here at all. Achilles believes himself to be insulted to all intents and purposes only in the fact that the share in the booty which he considers justly to belong to him and the reward of his personal merits, his *γέρας*, has been taken away by Agamemnon. The insult here has a direct reference to something actual, a bounty, in which no doubt a privilege, a recognition of fame and bravery was reposed, and Achilles is enraged because Agamemnon meets him unworthily and lets the Greeks know that they are not to pay any attention to him. An insult of this kind is not driven home to the real centre of personality in its abstract purity; in fact Achilles expresses himself satisfied with the restitution of the abducted slave and the addition of other goods and bounties, and Agamemnon finally makes this reparation although from our point of view they have both insulted one another in the grossest fashion. Maledictions of this kind, however, have only made them angry;

and, after all, the particular insult, which has reference to a matter of fact, is done away with in the same matter of fact fashion.

(*a*) The honour of romance is, on the contrary, of another kind. Insult has no reference here to the factual values of real things, property, status, obligation, etc., but to personality simply, and its idea of its own importance, the work which the individual claims as his right. This worth is in the cases we are now discussing of an infinite significance equal to that of personality itself. In honour, therefore, man possesses the earliest positive consciousness of his infinite spiritual medium, independent of the content. What the individual has, what in him something peculiar creates, after the loss of which it may yet subsist precisely as it did before — in this elusive something the absolute validity of the entire subjective life is reposed and apprehended in it both for itself and others. The determining measure of honour therefore does not depend on what the individual really is, but on what is contained in this personal self-regard. This regard, however, raises all particularity to the level of the universal conception that the personal core in its full significance resides in this particularity which it claims as its own. Honour is merely an outward show it is sometimes said. No doubt this is so: but from our present point of view we must, if we look at it more narrowly, accept it as the appearance and reappearance of the personal medium self-reflected, which as the semblance of an entity essentially infinite is itself infinite. And through this infinitude it is just this show or semblance of honour which is the real existence of the individual, its highest actuality; and every particular quality, into which honour is reflected and appropriates as its own is by virtue of this show exalted itself to an infinite worth. This type of honour constitutes a fundamental determinant in the romantic world, and presupposes that man has not merely passed beyond the limits of purely religious conception and inward life, but actually entered the arena of the great world and makes itself vital

in the material of the same simply by virtue of the pure medium of its personal self-subsistence and absolute intension[246].

The *content* of honour may be of the most varied kind. For everything that I am, do, or is done to me by others affects my honour. We may consequently reckon within its boundaries the out and out substantive itself, loyalty towards princes, fatherland, a man's profession, fulfilment of obligations, marital fidelity, integrity in business affairs and conscientiousness in scientific research. For the point of view of honour, however, all these essentially valid and veritable relations are neither sanctioned nor recognized in and through themselves, but only so far as the individual reposes in them his personal relation and makes them thereby matters affecting his honour. A man of honour consequently always thinks first of all about himself, and the question for him is not if anything is on principle right or not, but whether it is the right thing for him to do, whether it becomes him then as a man of honour to make himself master in it and to stand by it. And consequently he may also perpetrate the worst actions and still be a man of honour. He creates at the same time objects at will, imagines himself of a specific character, and appropriates to himself, both as he sees himself and is seen by others, that which in the natural order of things has nothing to do with him at all. Even then it is not the natural fact, but the personal view of it which places difficulties and devolutions in the path, because it has become an affair of honour to maintain that character. So, to take an example, Donna Diana conceives it to be derogatory to her honour to confess in any way the love she feels, because she has pledged herself not to listen to love. In general we may say, then, that the content of love is at the mercy of accident, because its validity depends purely on the personal attitude, and is not directed by that which is the essential mode of the inner life itself. For this reason we may observe that in romantic representations on the one hand that which is on principle justifiable is

expressed as the *law* of honour, the individual associating with the consciousness of right at the same time the infinite self-conscious unit of his personality. What is then expressed by the statement that honour makes such and such a demand, or forbids it, is this that the entire personal attitude of consciousness implants itself within the content of such a demand or prohibition so that no trespass in any transaction can fail to attract its attention without a repair and restoration being effected; and we may add the individual is unable to attend to any other content. Conversely, however, honour may resolve itself into something wholly formal and contentless, in so far as it contains nothing but the shell of the Ego, which is formally infinite, or only accepts an entirely bad content as obligatory upon it. In this case, more particularly in dramatic representations, honour remains but a wholly frosty and unvitalized object: its aims express no longer an essential content but simply an abstract form of consciousness. But it is only an essentially substantive content which possesses the contingency of law, and is capable of explication in its multifold environment, and can be apprehended in its imperative sequence of consequences. This defect in profound content especially rises to the surface when casuistry of reflection includes within the embrace of honour matter which is purely accidental and insignificant which the individual comes in contact with. There is never a lack of material, because this casuistical tendency analyses with great subtlety in its modes of distinction, and many aspects may be elicited and made the subject of honour which in themselves are quite unimportant Above all the Spaniards have elaborated this casuistry of reflection over matters of honour in their dramatic poetry, and made their particular heroes of honour deduce all their consequences in their speeches. In this way the fidelity of the married woman may form a subject of investigation into the minutest details, and the mere suspicion of another, nay, the possibility of such even when the husband is aware that the suspicion is false may be an

affair of honour. If this leads to collisions we can derive no real satisfaction from the process, because we have nothing of material moment to arrest us, and consequently instead of the resolution of an antagonism which is causally inevitable we can only extract from it a painfully contracted feeling. Also in French plays we frequently find that it is an honour which is barren, that is entirely abstract, which is made the essential fulcrum of interest Still more extreme is this essentially frostlike and lifeless type of it apparent in the drama "Alarcos" of Herr Friedrich von Schlegel. The hero here murders his noble and loving wife. And we ask why. Simply for honour's sake; and this honour consists in this that he may marry the king's daughter, for whom he entertains no affection, and thus become the king's son-in-law. Such a pattern is of course contemptible and an ignoble conception which merely prides itself as something lofty and of infinite intension.

(*b*) Inasmuch, then, as honour is not only a semblance in me myself, but must also exist in the mind and recognition of *another*, which again on its part makes a claim to a similar honourable recognition, honour is the extreme embodiment of *vulnerability.* For it is purely a matter of personal caprice how far I choose to extend the claim and to what material I care to relate it. The smallest offence may be in this respect of significance; and inasmuch as man is placed relatively to concrete reality in the most manifold relations with a thousand things, and is able to extend practically without limit the sphere of that which he conceives to affect him, and to which he is placed in the relation of honour it follows that when we come to deal with the independence of mankind and the obstinate isolation of their units, aspects for which the principle of honour is in the main responsible, there is no end to the strife and contention to which they give rise. Moreover, in the case of insult also no less than in that of honour generally, the important matter is not the content, in which I necessarily feel myself

insulted; for that which is negated has reference to the personality which has appropriated such a content as its own, and now conceives itself as this ideal centrum of infinity attacked.

(*c*) For such reasons every insult to honour is regarded as essentially of an infinite significance. It can consequently only be repaired by means which possess that character. No doubt we may have many degrees of insult, and as many modes of satisfaction; what however at the stage we are now considering any man may take as an insult, how far he will feel himself as insulted and claim satisfaction therefore, such considerations depend once more wholly on the personal caprice of the particular person, which is justified in pursuing its object to the utmost point of scrupulosity and outraged feeling. In this process of satisfaction, which is here claimed, it is essential that the man who delivers the insult no less than he who receives it should be recognized as a man of honour. For the latter requires the free recognition of his honour from the former; but in order to have honour in his eyes and through his action that man must appear to the recipient of insult as a man of honour, in other words he must substantiate by virtue of his personality the infinite character of the insult which he has laid upon the outraged man and despite his personal enmity that is thereby directed against him.

It is, then, a fundamental determinant in the general principle of honour that no one through his actions can give to any one a right over himself; and consequently all that he has done and may have initiated will be regarded both previous to its commencement and after its conclusion as unalterably affiliated to infinity, and will be accepted and treated under such a qualitative relation.

Moreover, since honour, in its conflicts and its satisfaction in this respect, depends on personal independence, which is conscious of itself as subject to no limitation, but acts directly from its own resources, we find a

fact recur to our attention, which we previously observed fundamentally characterized the heroic figures of the Ideal, namely the self-subsistence of individuality. In honour, however, we have not merely the secure self-dependence and action from personal resources, but this self-subsistence is in this case united with *the idea of itself*; and it is just this preconception which constitutes the real content of honour in the sense that it perceives what is its own in that which is presented exterior to it, and envisages itself therein to the full extent of its personal life. Honour is consequently a self-subsistence, which is a *self reflection*, and possesses in such a reflection its exclusive essence, and moreover leaves it wholly to accident whether its content be that which is essentially moral and necessary, or contingent and insignificant.

2. LOVE

The second emotional source which plays a predominant part in the productions of romantic art is *love.*

(*a*) We have found in honour that the individual conscious life, as it prefigures itself in its absolute *independence*, forms the fundamental determinant; in a similar way the highest attitude of love is the *surrender* of the personal life to some object of the opposed sex, a sacrifice of its independent consciousness and its personal isolation, which for the first time in the consciousness of another, is aware emotionally that it has thoroughly brought home to itself its own self-knowledge. In this respect we may contrast love and honour. Conversely, however, we are entitled to regard love as the *realization* of that which was already inherent in honour, in so far as honour claims recognition[247] that it should be received in another as the infinite significance of personality. This recognition is only true and complete when it is not merely my personality in the abstract, or in a concrete and consequently restricted case, is respected by another, but

when I, in the' entire significance of my personal resources, with everything this either emphasizes or includes, as this particular person in all my past, present, and future relations, both penetrate the conscious life of another, and, in fact, constitute the object of his real volition and knowledge, his effort and his property. In this respect it is this same inward infinitude of the individual which makes love of such importance to romantic art, an importance which is materially enhanced by the exalted character of the wealth which the notion of love itself carries.

More closely, then, love does not subsist, as may frequently happen in the case of honour, upon the subject-matter of the mind and the casuistry of reflection, but originates in the emotions, and for the reason that here the distinctions of sex play an important part, possesses at the same time for its basis natural conditions as already related to spirit life. This basis is, however, only present in the sense that the individual comes into relation with such conditions by way of his soul-life, that essentially infinite aspect of himself.

This state of a man's losing his own consciousness in another, this appearance of disinterestedness and unselfishness, by virtue of which a man first really finds himself and comes to himself — this oblivion of his own, so that the lover no longer exists, or is careful for himself, but discovers the roots of that life in another, and yet only comes into the full enjoyment of himself in that other is what gives us the infinite relation of love; and we must look for beauty mainly in so far as this feeling does not persist as mere impulse and emotion, but through the imagination makes its world conform to such a condition, exalts everything which otherwise belongs by virtue of its interest, circumstances, and objects to real existence and life, into an adornment of this feeling, bears away all else into the charmed circle, and only attaches a value to it in this relation. More particularly it is in female characters that love appears in most beautiful guise because this sacrifice,

this surrender, is with them as the culmination of everything else. It is these qualities, in fact, which concentrate and extend life in its spiritual breadth and reality to the wealth of this emotion, which alone discover within it a stay for existence, and if any misfortune sweeps across the path, vanish like a light which is extinguished by the first rude breath[248]. In this personal and intimate sense of feeling love is not presented in classical art, and only appears as a feature of quite secondary importance for the representation, or is only conspicuous under its aspect of physical enjoyment. In Homer, either we find it is not emphasized at all, or love appears in its most respected type as wedded love in the sphere of the domestic state, exemplified in the figure of Penelope, or as solicitude of wife and mother, exemplified in the case of Andromache, or in other ethical relations of a similar character. The tie, on the other hand, which unites Paris to Helen is recognized as immoral, and the cause of the horror and fatal course of the Trojan war. The love, too, of Achilles for Briseis has little depth of sentiment or spiritual flavour, for Briseis is a slave entirely at his disposition. In the odes of Sappho it is true that the language of love receives the dramatic emphasis of lyrical enthusiasm; yet it is rather the insinuating and devouring flame of the blood which is here expressed than the profound emotion of the singer's heart and soul. From another aspect we find in the short and charming odes of Anacreon a wider and more jovial sense of enjoyment, which sports with delight on the immediate sense of enjoyment as over something to be simply accepted as it falls without troubling itself with infinite heartaches, without this overmastering of the entire life or the pious submission of a burdened, yearning, and yielding soul; in this type the point of infinite importance whether it is precisely this or that girl which you possess is as absolutely disregarded as the monkish notion that you should shun maidenhood altogether. The lofty tragedy of the ancients does not recognize the passion of love in its romantic significance.

Pre-eminently in the case of both Aeschylus and Sophocles we find that it makes no pretension to contribute to the main interest of the drama. For although Antigone is the accepted lover of Haemon, and Haemon claims her before his father, nay, goes to the length of committing suicide because he is unable to deliver her, yet it is the external aspects of the case rather than the power of his own personal passion, which, we may also note, is not that of a modern lover, which he emphasizes before Creon. As a more essential type of pathos love is treated by Euripides in the "Phaedra." But here, too, it rather makes itself felt as a criminal aberration of the blood, as a passion of the senses, initiated by Aphrodite, who is desirous of slaying Hippolytus, because he refuses to sacrifice to her. In the same way we have, no doubt, in the Medicean Aphrodite a plastic figure of love, whose exquisite pose and lovely elaboration of bodily form is quite consummate; but any profound expression of soul-life such as romantic art demands is wholly absent. On the other hand, the immortality of Petrarca, although he himself treated his sonnets in the light of recreation, and it was rather through his Latin poems and other works that he appealed to posterity, is due to this very love of the fancy which, under an Italian sky, joined sisterly hands with religion in the medium of a somewhat artificial outpouring of the heart. Dante's exaltation, too, originated in his love for Beatrice, which was transfigured in his soul to the white fervour of religious ecstasy, while the courage and boldness of his genius created energetically a religious outlook on the world, in which he dared, an attempt impossible without such gifts, to constitute himself the judge of mankind, and to apportion to individuals hell, purgatory, or paradise. In contrast to an exaltation of this kind love is placed before us by Boccaccio in those romances of his, in which he brings before our eyes the morals and life of his country, partly in all its impetuosity of passion, partly, too, in the spirit of frivolity without any ethical aim whatever. In the songs of the German Minnesingers we find

a type of love, sensitive, tender, without much generosity of imagination, sportive, melancholy, and monotonous. Among the Spaniards it is copious in imaginative expression, chivalrous, somewhat casuistical in its discovery and defence of rights and duties, so far as they relate to private affairs of honour; and in this respect also possesses all the richest splendour of enthusiasm. In contrast to this among Frenchmen of more modern times love is more an affair of gallantry with a distinct bias toward vanity, an artificial state of feeling converted to the uses of poetry with a kind of sophistry of the senses often marked with the finest wit, at one time expressing a kind of sensuous enjoyment which is devoid of passion, at another a passion that brings with it no enjoyment, a sublimated condition of feeling and sensibility which feeds upon the maxims of reflection. But I must here break off these general indications which our subject does not permit me now to carry further.

(*b*) More closely looked at the secular interest may be treated under two general divisions. We have on the one side secularity as actually organized, such as family life, the tie of citizenship and politics, law, justice, morality, and the rest; and in opposition to this[249] independent and assured existence love springs up in noble and impetuous spirits; this world-religion of hearts, which at one time we find joining hands with religion in every respect, while at another it supersedes it, forgets it, and by constituting itself the single essential, or rather the unique and supreme condition of life, is not only prepared to renounce all else, and to fly for refuge to a desert with the beloved, but proceeds in this extremity of its passion, which we can only exclude from the domain of beauty, to sacrifice all the worth of humanity in a manner at once servile, degrading, and despicable. An example of this we have in "Kätchen von Heilbronn." On account of this cataclysm of life's essential interests the objects of love cannot be realized without *collisions* in the theatre of the world. For despite of love the general conditions of life

make their demand and assert their claims and the despotism of love's passion is unable to maintain itself against them with impunity.

(*α*) The first and most frequently exemplified type of collision we may draw attention to is that between *honour* and *love.* In other words, honour possesses just as love possesses in its own right this infinitude of claim, and may accept a content, which may confront love as a positive obstacle in its path. The obligations of honour may require the sacrifice of love. From a certain point of view it would be, for example, dishonourable for a man of high rank to wed one of the lower classes. The distinction between class and class is a necessary fact of natural condition as ordinarily presented[250]. And so long as our secular life has not been emancipated through the infinite notion of true freedom, whatever may be the class or profession from which that life in the particular individual and his free choice takes its rise, to that extent it will always be Nature, that is, the birth condition, which to a greater or less degree will, on the one hand, determine the social position; and, on the other, these distinctions of status, as they thus originate, and quite independently of general grounds of honour, in so far as social position is made an affair of honour, will maintain themselves as of absolute and infinite stability.

(*β*) Quite apart, however, from questions of honour we must add as a further example of collision that the eternal and *substantive* powers themselves, the interests of the State, love of country, family obligations, and the rest, come into conflict with love and preclude its realization. Particularly in modern representations, in which the objective conditions of life have been already elaborated in all their available stringency, this is a favourite type of collision. Love is in such cases, as itself an important right of the personal soul, either set forth in opposition to other rights and duties, or despite of its own recognition of such it enters upon a conflict with them reliant upon itself and with the power of its private passion. The "Maid of

Orleans"[251] is an example of a drama which rests upon a collision of this kind.

(*γ*) And in the *third* case we may find in a general way that *external* condition and its impediments oppose obstacles in the path of love. Such are the ordinary course of events, the prose of ordinary existence, misfortunes, passion, prejudice, follies, the selfishness of others, occurrences of every conceivable complexity and kind. Much will here present itself that is hateful, terrible, and mean, for it is mainly the evil, ruthless, and savage aspects of other forms of human passion which work contrary to the tender spiritual beauty of love. More particularly in later times we frequently come across external collisions of this sort in dramas, narratives, and romances, works whose main interest centres in a sympathy for the sufferings, expectations, and ruined prospects of unhappy lovers and affect or satisfy us by means of their bad or happy endings, or merely provide entertainment. This type of conflict, however, on the ground that it merely depends upon accidental matters, is a subordinate one.

(*c*) No doubt love, from whatever of these points of view you choose to regard it, possesses a lofty quality, in so far as it does not merely remain an impulse of sex-attraction, but emphasizes the bounty of a really rich, beautiful, and noble soul, and is a living, active, courageous, and disinterested bond of union between one person and another. But romantic love is also not without its *limitation.* That which disappears from its content is the essentially realized *universality.*[252] It is merely the *personal* feeling of one particular individual, which does not attest itself as fulfilled with interest of eternal import and the actual content of organic human life, as made up of family, political aims, one's own country, obligations of profession, status, freedom, and religion, but merely with the personal consideration which is intent upon receiving again such private feeling as reflected back from some one else. Such a content of what is itself still but a

formal mode of spiritual life does not correspond in full truth to the totality, which the essentially complete personality[253] ought to be. In the family, marriage, duty, and the State the personal feeling simply as such and the unity which issues from it with some particular person and no other is not the main point of interest. In the love of romance, however, all centres in the fact that this man or woman loves that woman or man and *no one else.* Yet it is precisely this fact that it is only this or that person, which is solely based upon personal idiosyncracy, in other words, the contingency of caprice. There is no lover who does not think his beloved, no maiden who does not fancy her lover, as the fairest and most supreme, to the exclusion of all others, although they may appear very ordinary mortals in the eyes of other folk. But in just this fact that all the world or, let us say, a large number, act thus exclusively, and will not make an exception in favour of the unique Aphrodite herself, but rather possess an Aphrodite of their own, and very easily somewhat more than Aphrodite, we can only very obviously conclude that there are many who pass for the same fairy Princess, as no doubt every one knows well enough, that there are a whole bevy of pretty or good and excellent girls in the world, all of whom, or let us hope the majority, will secure their own lovers, adorers, and husbands, to whom they doubtless appear as gifted in like manner with all the beauty and virtue of Christendom. To bestow in every case our preference on one, and only one, is obviously a wholly private affair of the heart and of the separate individuality of each person, and the incommensurable obstinacy in discovering as though by a law of necessity one's life and supremest sense of such in just that one individual is proof that it is a caprice no less infinite in its significance than it is inevitable. We have without question in this attitude the loftier freedom of the personal life and its absolute power of choice recognized, the power to be, not merely as we find in the "Phaedra" of Euripides, under the constraint of a pathos, a divinity; but in regard to the

absolutely individual volition, from which such a liberty proceeds, such a choice appears at the same time to be a mere idiosyncrasy, an inflexibility of that which is wholly self-exclusive.

For this reason the collisions of love, more particularly when it is set in hostile opposition to substantive interests, retain an aspect of contingency and lack of authorization, because it is the personal life as such which confronts in opposition with a demand not independently justifiable that which for its own essential sake has a claim to recognition. The personalities in the lofty tragedy of the ancients such as Agamemnon, Clytemnestra, Orestes, Oedipus, Antigone, and Creon have, it is true, among other things a personal object; but the substantive thing, the pathos, which as the content of their action is the compelling force behind them, is of absolute authority, and for this very reason, is also itself essentially of universal interest. The destiny which affects them on account of their action does not therefore move us on the ground that it is a fate of misfortune, but because it is a misfortune which affects or redounds to their honour. In other words the pathos, which will not rest until it is satisfied, possesses an essentially necessary content. When the guilt of Clytemnestra, in this concrete case of it, receives no punishment, when the insult which Antigone receives as sister[254] is not removed, in both cases we have a substantial wrong. These sufferings of love, however, these shattered hopes, this being in love generally, these infinite pains experienced by lovers, this measureless happiness and bliss which such imagine, are no such essential interest but rather something that merely affects themselves. All men, it is true, should be sensitive to love and may claim satisfaction in this respect. But when a man fails to secure that object in some particular place, in precisely this or that association, under just these circumstances and in respect to one unique maiden we can admit no absolute wrong. There is nothing essentially inevitable in the fact that a man should capriciously

select any particular young woman, and that we should interest ourselves consequently for that which is in the highest degree accidental, a caprice of his own conscious life, which carries with it no impersonal expansion or universal significance. We have here the source of that tendency to cool which we cannot help feeling in the representation of the passion of romantic love however that passion may be emphasized.

3. FIDELITY

The third type of soul-life which is of importance to the romantic consciousness on the field of its activity in the world is *fidelity.* By fidelity in the sense we are now using it we do not mean either the permanent adherence to the avowal of love once given, nor yet the stability of friendship in the beautiful image of the same such as we have left us by the ancients in that of Achilles and Patroclus, or with yet more intimacy, that of Orestes and Pylades. Youth is pre-eminently both the soil and the occasion from which friendship of this latter type originates. Every man has to construct his path of life independently, to work out and sustain a given mode of realization. The time of youth, when individuals still live in an undefined atmosphere of external relations which they share, is the one in which they associate closely, and are bound together so nearly in *one* mode of thought, volition, and activity, that everything that any one of them undertakes becomes at the same time the undertaking of another. When men attain maturity this is no longer the case. The circumstantial life of the grown man pursues its independent course and will not admit of so close an affiliation with that of another that we can affirm of it that one cannot accomplish it without the other. Men make acquaintances and then separate; their interests and business are at one time disjoined, at another they coalesce; friendship, intimacy of mutual opinions, of principles, and the general trend of their life may remain; but this is not the friendship of

youth, in which no individual unit either makes a decision or carries it into effect without inevitably making it a matter in which another is concerned. It is an essential principle at the very root of our life that in general every man must look after himself, must, in other words, prove by himself his capacity to confront the reality which affects him.

(*a*) Fidelity in friendship and love, then, subsists solely between equals. The fidelity which we have now to consider is relative to a superior, one more highly placed, a *master*. A fidelity of this type is to be found even among the ancients in that of servants to the family, the house of their lord. The most beautiful example of such a relation is supplied us by the swine-herd of Odysseus, who sweats by night and through tempest in order that he may look after his swine; who is full of anxiety on his master's account, to whom he finally gives loyal assistance against the suitors. Shakespeare offers us a picture of fidelity no less moving, though it is here shown entirely on the side of the feelings, in his "King Lear."[255] Lear asks Kent, "Dost thou know me, fellow?" And Kent replies: "No, sir; but you have that in your countenance which I would fain call master." This borders as close as possible on that which we would make clear as romantic fidelity. Fidelity at this stage is not the loyalty of slaves and churls, however true and pathetic such unquestionably may be, which is none the less devoid of the free independence of individuality and its unrestricted aims and actions, and is consequently of subordinate rank. What we, in short, have before us is the liege-service of chivalry, in which each vassal preserves intact his own free self-dependence as an essential element in the attitude of subordination to one of higher rank, whether lord, king, or emperor. This type of fidelity, however, is a principle of supreme importance in chivalry for the reason that it forms the fundamental bond of union in a common society and its social co-ordination at least in the original form of its appearance.

(*b*) The object which thus receives a fuller content and is made apparent in this new type of association between individuals is not, however, by any means patriotism regarding that as an objective and universal interest, but a bond merely with one person, the lord, and for this reason conditioned by private honour, personal advantage and opinion. In its fullest brilliancy we find fidelity of this kind in a surrounding world that is unregulated and uncouth, beyond the control of right and law. Within a lawless reality of this kind the most powerful and commanding spirits stand out as fixed points of attraction, as leaders and nobles, and the rest rally round them of their own free will. Such a condition is later on elaborated into a legalized co-ordination of fealty, in which every vassal has his own claim to rights and privilege. The fundamental principle, however, upon which the entire system reposes is in its primary origins free choice, no less in relation to the dependent vassal than to the conditions under which he remains faithful to his vassalage. For this reason the fidelity of chivalry is quite prepared to maintain property, right, and personal independence and honour, and is on this account not simply recognized as an *obligation* which may be enforced to the entire disregard of the private inclinations of the vassal however they may arise. Quite the contrary. Every subordinate unit only continues there and helps to establish the general social order so long as the same falls in with his own wishes, inclinations, and opinions.

(*c*) On this account fidelity and obedience to the feudal lord can very readily clash with private feelings, an exasperated sense of honour, sensitiveness to insult, love, and many other chance incidents of the personal or external life. It is consequently of a highly precarious character. A knight, for example, is loyal to his lord, but a friend of his happens to quarrel with him. He has now to choose between the two objects of his fidelity, and, chief of all, he has to consider himself, the claims of his

personal honour and advantage. The most beautiful example of such a conflict we have in the "Cid." He remains as true to himself as he is to his king. If the king acts wisely he assists him with his arm's strength; if his feudal lord acts wrongly or the Cid feels touched on the point of honour this powerful support is withdrawn. The paladins of Charles the Great exhibit much the same attitude. It is a tie of chieftainship and obedience not unlike that which we have already observed between Zeus and the other gods. The superior lord commands, blusters, and scolds, but the independent and powerful individualities resist him precisely when and as they please. We find the most consistent and charming picture of the conditional and easy terms under which this bond is maintained in the "Reinecke Fuchs." Just as the magnates in this kingdom are most really true to their own aims and independence, we find that the German barons and knights in the Middle Ages were not at home when called upon to act for the sake of the general weal and their emperor; and it really looks as though our chief praise of the Middle Ages must consist in this that no man is in such a period justified in his own eyes or a man of honour, except in so far as he runs after his own inclinations, in other words, does precisely that which he is not suffered to do in a State which is organized on a rational basis.

In all these three stages of honour, love, and fidelity, we shall find the soil on which the self-subsistency of personality, the soul, is supported, an independence which, however, constantly unfolds in a wider and more affluent content, remaining in the same self-reconciled. Here stretches before us in romantic art the fairest strip of country which we can find anywhere outside the enclosure of religion in its strict sense, Its objects are concerned with that which is simply human, a relation with which we can at least from one aspect of it, namely, that of personal freedom, absolutely sympathize, and we do not find here, as we do now and again in the religious field, both a material and modes of representation which clash

with our modern notions. But at the same time we must add that our present subject matter may very frequently be brought into direct relation to religion so that religious interests are interwoven with those of the world of chivalry; as, for example, was the case in the adventures of the knights of the round table in their quest of the Holy Grail. In this interfusion we find not only much that is mystical and fantastical, but also much that is allegorical added to the poetry of chivalry. And conversely this secular sphere of the interests of love, honour, and fidelity may also be totally unconnected with the deepening of their content with religious aims and opinions, and only bring to view the earliest movement of soul-life in the secular aspect of its spiritual intensity. That which, however, drops away from the present levels is the repletion of this inner life with the concrete content of human conditions, characters, passions, and realized existence generally. In contrast to this variety the essentially infinite soul still remains abstract and formal, and has therefore in front of it the task, to accept as part of its own this further material with what it held before, and to exhibit the same in the forms congenial to artistic composition.

[241] He has not in this exclusive sense of religiosity identified himself with the spirit of the Christian community. *Der Anderen* refers to *Gemeinschaft.* Such appears to me the sense.

[242] *Zur Wirklichkeit entfaltetes Leben.*

[243] Put more simply we may say in popular terminology that it is filled up or amplified by virtue of the sense of individual personality. This Hegel himself further elucidates below. Falstaff undoubtedly possessed a strong personality, but in his famous soliloquy on honour he deliberately emptied himself of any sense of it by refusing to view himself under the self-relation, that is self-respect.

[244] I fail to appreciate this distinction, except in a very qualified form. Even in the Middle Ages when the feudal relation was in full force, the

relation between the master and the servant was surely one of the institutions of the State, though no doubt the rights of the dependent were not always very readily enforced. Even in the case of slavery in the Southern States of America the relation between master and slave carried with it quite definite ethical obligations — there was in general at least quite a distinct social if not actually political status.

[245] I suppose Hegel means by *ein Punkt* a centre or point of life. The expression is rather unusual.

[246] *Absoluten Geltung*, that is its absolute validity in its ideal character.

[247] The punctuation in text is defective.

[248] So runs the text. It comes from such a writer with a shock. Why such qualities should vanish (*schwinden*) in the presence of unhappiness it is not easy to see. It would rather appear that such was the condition to evoke them. What is meant is, I suppose, that the failure of *reciprocity*, especially in the love of women, often brings complete collapse. We may illustrate it in several of Meredith's novels such as "Diana" and "Sandra Belloni."

[249] The two sides would appear to be the secularity of the social organism and "free" love.

[250] This I think is the meaning. Until the full notion of liberty is apprehended the divisions of class will have the appearance of natural necessity.

[251] Schiller's drama of that name.

[252] *Die an und für sich seyende Allgemeinheit.* The universal notion as explicitly made actual in life.

[253] *Ein in sich konkretes Individuum.* The whole of this analysis appears to me a rather abstract and professorial consideration of romantic attachment, separating love from its reality of association and relation in actual life. In so far as it is true it is purely abstract truth, and must be regarded as such. In actual life it is no more true that even in the average

case misfortune blights the blossom than it is true that the love of the individual concentrates itself solely on the mere attachment between two persons. It is bound up with the idea of family and continuation of the race, and so indirectly with the State.

[254] As sister of her violated brother Polyneices.

[255] Act I, sc. 4.

CHAPTER III

THE FORMAL SELF-SUBSISTENCY OF INDIVIDUAL PARTICULARITIES

IF WE TAKE a glance back on the territory we have passed through, we see in the first instance that the object of our investigation was the life of the soul[256] in its most absolute capacity, in other words, consciousness in its mediation with God, the universal process of the self-reconciling spirit. The abstraction of this point of view consisted in this that the soul by an effort of abnegation withdrew itself from all that was secular, purely natural and human — even when the same had ethical features, and for this reason possessed a claim upon us — into its own distinctive domain in order to satisfy its yearning for the pure heaven of spirit. *Secondly*, we found ourselves able, it is true, to bring into view the human consciousness without this factor of abstract negation which was included in that mediation, in other words, positively in its independence and as related to others[257], but the content of this secular infinitude as such was none the less only the personal self-subsistency of honour, the intensiveness[258] of love and the vassalage of fidelity, a content which, no doubt, may appear before us in many relations, in a many-folded variety and many gradations of feeling and passion, subject to the most extensive changes of external condition, yet for all that only propounds just this personal independence and inwardness within such examples. The *third* aspect, then, which we have now left us to examine is the mode and manner in which that further material of human existence, both on the side of its inward and its external life, that is to say, Nature and its apprehension and significance for soul-life,

is able to enter into the romantic type of art. We have here to deal with the world of particular objects, determinate existence generally, regarded in its unfettered independence, and which, in so far as it does not appear transparent to religion and spiritual synthesis, bringing it into unity with the Absolute, asserts itself on its own foothold and declares its self-subsistence in its own kingdom.

In this third province of the romantic type of art consequently the purely religious material and chivalry with those lofty views and aims that we found it brings to birth from its spiritual womb[259], but which were not directly concordant with anything visible in the reality of the existing world, have vanished. The new object of satisfaction is a thirst for this actual presence itself, a delight in the facts of existence, a contentment of the soul with the dwelling that confronts it, with the finitude of our humanity, and what is finite, particular, and the true counterfeit of such generally. Man is intent to recreate for his own world the world as he actually finds it, although such may imply a sacrifice of the Beauty and ideality of the content and manifestation will reflect it as it stands before him endowed with life in his art, will have that present life before his eyes as the work of his own mind. The religion of Christianity as we have already seen has not sprung up from the soil of the imagination as was the case with the divinities of the East and Greece, whether we consider them relatively to form or content. It is the imagination which fashions the vital significance out of its own resources in order to promote the unity between the reality of soul life with the perfected embodiment of the same. In classical art this complete coalescence is actually attained. In the Christian religion, on the other hand, the secular aspect in its exclusive character is from the first accepted for just that which it really is as an essential factor of the Ideal; and the soul of man finds satisfaction in the ordinary and contingent presence of the external world without the necessary interposition of beauty.

But man is nevertheless in the first instance reconciled to God only by implication, and as a possible result. All men are called to the blessed condition, but few are chosen; and the soul for which both the kingdom of heaven and that of this world still remain as a “beyond” is constrained to renounce both that which is spiritual in the external world and its own presence therein. The point of departure is from a distance infinitely remote from that world; and to make this reality, which in the first instance is simply surrendered, a positive constituent of that which is man’s own, in other words to bring about this rediscovery of himself and his volition in his own present life, from which all takes its rise, this it is which supplies us first with a terminating point in the elaboration of romantic art, and is the final outlook to which the spiritual penetration of man is carried and on which it is concentrated.

In so far as the form of this new content is concerned we have already observed that romantic art from its first initiation was infected with the contradiction that the essentially infinite mode of the self-conscious life is, in its independence, incapable of being united with the external material, and is bound to remain in such separation. This independent opposition of both aspects and the withdrawal of the inwardness of spirit into its own domain is that which constitutes the content of romance. These two aspects are continually separated anew by self-rehabilitation[260], until at length they fall entirely apart, and thereby demonstrate that we must search for some *other field* than *Art* to secure their absolute union. And by this falling apart we find that these aspects in their relation to art are *formal*; in other words they fail to appear as a totality in that complete type of unity which was secured to them by the Classic Ideal. Classical art is placed in a region of stable figures, that is in the midst of a mythology and its irresoluble types perfected by art. The resolution of the classical form is consequently brought about — as we found in discussing its transition to the romantic

form — leaving out of our present consideration the generally more restricted territory of the comic and satyric modes — by an over-elaboration in the direction of all that pleases the senses or an imitation which loses itself in the deadly frost of a pedantic learning, till it at length entirely degenerates into a negligent and inferior technique. The objects of art remain, however, the same throughout the process, and merely play truant to the earlier intelligent mode of production with a presentation that is increasingly more spiritless and a purely traditional and mechanical technique. The progress and conclusion of romantic art on the contrary is the resolution of the material of art within its own boundaries[261] altogether, a material which falls apart into its elements, an increase of freedom in the several parts, along with which process and in contrast to the previous case, the individual craftsmanship and artistic mode of presentment is enhanced; and in proportion as the substantive content tends to break up to that extent attains a fuller perfection.

We may now attempt a more specific subdivision of this the final chapter of this part of our subject in the following terms.

In the first place we have before us *the self-subsistency of character*, which is, however, a particular one, that is, a definite individual self-absorbed in its world, its specific qualities and aims.

In opposition to this formal particularity of character we have the external conformation of situations, events, and actions. For the reason, moreover, that the inward spirituality of romance stands generally in an indifferent relation to that which is external the actual phenomenon[262] appears in the present case independently free, that is as neither permeated by the spiritual content of human aims and actions nor clothed in modes adequate to retain them. By reason of its unrelated and loose mode of manifestation it therefore enforces the contingency of natural processes[263],

circumstances, the sequence of events, and manner of its realization as *the unexpected.*[264]

In the *third* place, and finally, the severation of the two factors asserts itself, the complete identity of which supplies us with the real notion of art. This is consequently the dismemberment and dissolution of art itself. On the one hand we find that art passes to a representation of wholly commonplace reality, to the reflection of objects precisely as they appear in their contingent isolation and its equally singular characteristics. Its interest is now wholly absorbed in reproducing this objective existence by means of the technical ability of the artist. On the other hand we have, in what is a mode of conception and representation entirely dependent on the accidental idiosyncracy of the artist himself, that is in humour, a complete reversal of the pictorial style above mentioned. For in *humour* we meet with the perversion and overthrow of all that is objectively solid in reality; it works through the wit and play of wholly personal points of view, and if carried to an extreme amounts to the triumph of the creative power of the artist's soul over every content and every form.

1. THE SELF-SUBSISTENCY OR INDEPENDENCE OF INDIVIDUAL CHARACTER

The fundamental determinant of our present subject-matter is once again that infinitude implied in the very nature of the human consciousness which was our point of departure in the romantic type of art. The new accretions we have now, however, to add to our conception of this mode of self-subsistent infinity consist partly in the *particularity* of content, which constitutes the world of the individual mind, as to a further aspect of it in the immediate coalescence of the ego with this its particularity, its wishes and objects, and thirdly, in the living individuality, in which the substantive character is self-determined. We are not, therefore, entitled to understand

under the expression “character” as now employed that which the Italians represented in their masks. The Italian masks are also no doubt definite characters, but this definition is only presented by them in its abstraction and generality, without a personal individuality. The characters, on the other hand, of the type under discussion are each of them a character unique in itself, an independent whole, an individual person[265]. If we have, therefore, occasion here to refer to the formalism and abstraction of character, such an expression is entirely relative to the fact that the fundamental content, the world of such a character appears, on the one hand, as restricted and to that extent abstract, and, on the other, as qualified by accidental causes. What the individual is is not carried or sustained by virtue of what is substantive or essentially self-accredited[266] in its content, but through the naked personality asserted by the character, which consequently reposes formally on its own individual self-subsistency rather than on its content and its independently secured pathos.

Within the limits of this formalism we may now observe *two* main lines of distinction.

On the one hand we have the stability of character in the energy of its *executive* power, which restricts its line of action to specific aims, and entrusts the concentrated force of individuality thus restricted to the realization of such objects. On the other hand we have character under the aspect of a totality that is *personal*, which, however, persists not wholly articulated throughout the content of that inward life and in the unsounded[267] depths of the soul, and is unable to unravel itself wholly, or express itself with absolute clarity.

(*a*) What we have therefore before us, in the first instance, is the particular character which wills to be that its immediate presence proposes, Just as animals differ from each other and discover themselves as independent creatures in this difference, so, too, here we have different

characters whose range and idiosyncracy remains subject to the element of contingency[268], and is not to be accurately determined by the mere notion.

(α) An individuality of this kind built up entirely on itself consequently has no ready thought-out opinions and objects, which it has associated with any universal principle of pathos: all that it-possesses, does, and accomplishes it creates right away with no further reflection out of its own specific nature; which is just what it happens to be, and has no wish to be rooted in anything more exalted, to be resolved in that and to find its justification in something substantive. Rather it reposes unyielding and unmalleable on itself, and in this stability either goes on its way or goes to ground. A self-subsistency of character of this kind is only able to appear, where the secular or natural man[269], in other words, humanity in its particularity has secured its fullest claim. Pre-eminently the characters of Shakespeare are of this type. It is just this iron[270] steadfastness and exclusiveness which constitutes the aspect of them which most excites our wonder. We have no word here of religion for religion's sake, or action as the embodiment of human reconciliation, in the unqualified religious sense, or of morality pure and simple. On the contrary we are presented with individuals, conceived as dependent solely on themselves, possessed with aims that are their own exclusively, exclusively deducible from their individuality, and which they carry through as best satisfies them with the unmitigated consequences of passion, and with no incidental reflection on the principles involved. In particular the tragedies, such as "Macbeth," "Othello," "Richard III" and others contain one character of this type for their main interest surrounded by others less pre-eminent for such elemental energy. Macbeth is forced by his character, for example, into the fetters of his ambitious passion. At first he hesitates, then he stretches his hand to seize the crown; he commits a murder in order to secure it, and in order to maintain it storms on through the tale of horror. This regardless tenacity,

this identity of the man with himself, and the object which his own personality brings to birth is the source to him of an abiding interest. Nothing makes him budge, neither the respect for the sacredness of kingship, nor the madness of his wife, nor the rout of his vassals, nor destruction as it rushes upon him, neither divine nor human claims — he withdraws from them all into himself and persists. Lady Macbeth is a character of the same mould, and it is merely the chatter of our latter-day tasteless criticism which can find in her the least flavour of affection. At her very first entrance, on reading Macbeth's letter reporting his meeting with the witches and their prophecy in the words[271]: "Hail to thee, thane of Cawdor! Hail to thee king that shall be!" she exclaims, "Glamis thou art and Cawdor; and shall be what thou art promised. Yet do I fear thy nature; it is too full o' the milk of human kindness, to catch the nearest way." She shows no affectionate trait, no joy over the happiness of her husband, no moral emotion, no sympathy, no pity of a noble soul; she simply fears lest the character of her husband will stand in the path of his ambition. She regards him simply as a means. With her there is no recoil, no uncertainty, no consideration, no retreating, as we find is at first the case with Macbeth, no repentance, but the pure abstraction and rigour of character, which perpetrates that which falls in with it, until it finally breaks. This collapse which comes in a tempest on Macbeth from the outside as he executes his object, becomes madness of the mind in Lady Macbeth. Of the same type is Richard III, Othello, the old Margaret and many another also. We have its opposite in the wretched coherence[272] of modern characters, such as those of Kotzebue, which are outwardly noble in the highest degree, great and excellent, yet in their soul-force are all rags and tatters. Later writers have done no better in other relations, despite their supreme contempt for Kotzebue. Heinrich von Kleish is an example with his Kätchen and Prince von Homburg[273], characters in which, in contrast to the alert condition of

real causal effect, magnetism, somnambulism, and sleep-walking are depicted as that which is of highest and most effective moment. This Prince von Homburg is a most pitiable exhibition of a general; he is distracted when he makes his military dispositions, writes out his orders in a way none can decipher them, is engaged in the night previous to the battle with morbid forebodings, and acts on the day of battle like a fool. And despite such duality, raggedness, and lack of harmony in their characters these writers imagine that they tread in the footsteps of Shakespeare. Wide indeed is the distance which separates them, for the characters of Shakespeare are essentially consequent in what they do; they remain staunch to their master passion; in what they are and in what confronts them, nothing makes them veer round but what is in strict accord with their rigidly determinate character.

(*β*) The more particular, then, the character is, which relies purely on itself, and consequently readily approaches evil, to that extent it is forced in the concrete world of reality to maintain itself, not merely against the obstacles which lie in its path and prevent the realization of life's aims, but so much more by this very realization such is driven headlong to its downfall. In other words, on account of the fact that it achieves its object, the fate that has its origin in the specific nature of its character itself, deals it a blow in a mode of destruction it has itself prepared. The development of this fatality is, however, not merely a development from the *action* of the particular personality, but quite as much a growth of the soul[274], a development of the *character* itself in its headlong movement, its running wild, its shattering in pieces or exhaustion. Among the Greeks, for whom pathos, the substantive content of action, rather than the personal character, is the important feature, a destiny affects the character that is thus sharply defined to a less degree for this reason, that it is not further evolved within the sphere of its activities, but remains at their conclusion what it was at the

start. In the compass of our present subject-matter, however, by the carrying through of the action itself, the inner life of the personality is evolved quite as much as the progress of the action; the advance is not simply on the outside. The action of Macbeth appears at the same time a descent of the soul into savagery, accompanied by a result which, when all irresolution is thrown to the winds, and the dice is cast, leaves nothing further able to restrain it. His wife is from the very first decided: development is shown here merely as the anxiety of the soul, which is carried to the point of physical and spiritual ruin, the madness, in short, which strikes her down. And this is the kind of process which we can follow in the majority of Shakespeare's characters, whether important or unimportant. The characters of ancient drama assert themselves, no doubt, also on fixed lines, and we find them even face to face with opposed forces, relief from which is no longer possible except through the advent of a *deus ex machina.* Yet this stability, as in the case of Philoctetes, is united to a content, and, on the whole, penetrated with a pathos which may be vindicated on ethical grounds.

(*γ*) In the sphere of presentation we are now considering, owing to the contingent nature of all that the characters which belong to it seize upon as their aim and the independence of their individuality, no *objective reconciliation* is possible. The environment of all that they are, and what opposes their progress, is in part without defined lines, but also in part we see that there is neither a "Whence" nor a "Whither" unriddled for themselves. Here we have once more presented to us that Fate which is the most abstract form of Necessity. The only reconciliation of the individual issues from the infinite mode of his soul-life, his own steadfastness, in which he stands supreme over his passion and his destiny. "Thus it came to pass,"[275] whatever falls in his way, whether it be due to a controlling destiny, necessity or accident, there is his "Wherefore"; he accepts it at once

without further reflection. It is fact, and man adjusts himself thereto, and tries to make himself as stone toward its authority.

(*b*) In absolute contrast to the above, however, there is a further or *second* mode in which the formal aspect of character may find its seat within the *innermost* of soul-life, and in which the individual may remain fixed without being able to extend its range or execute its effects.

(*α*) Such are those spiritual natures of intrinsic substance, who, while self-absorbed in a complex whole, are only able in the simplicity of their compactness[276] to perfect that profound activity within the shrine of the soul without further development or explication in the world around them. The formalism which we have hitherto been examining was relative to the defined character of the content, the entire self-concentration[277] of the individual upon one object, which it makes to appear in all its unrelieved severity, a concentration which expressed itself, was carried out, and in which, just as circumstances fell out, either collapsed or held on to the end. This further mode of formalism is emphasized in a converse way by its undisclosed and formless character, and by its defect of expression and expository power. A soul of this type is like some precious jewel, which is only visible at certain points, a manifestation which is that of a lightning flash.

(*β*) And the reason that such state of self-seclusion should still be of worth and interest to us is due to the fact that it presupposes a secret wealth of the soul, which, however, only permits its infinite depth and fulness, and precisely, by means of this silence, to show itself in a few and so to speak half-muted ways of expression. Such simple natures, unconscious of what they possess, and without speech, may exercise an extraordinary fascination. But that this may be so their silence must be like the unruffled stillness of the sea upon its surface, over its unsounded depths, not the silence of all that is shallow, hollow, and stupid. It is quite possible

sometimes for the dullest fellow to succeed by means of an external demeanour that manages very little to expose itself, and merely presents now and again something that is but half intelligible, to awake in others the opinion that it is the veil of a profound wisdom and spiritual depth, so that people wonder what in the world lies hidden in such a heart and soul, where we find in the end there is just nothing. The infinite content and profundity of *silent* souls of the genuine type is made clear to us — and to declare it makes the greatest demand on the intuitive powers and executive ability of the artist — by means of isolated, unrelated, naïve, and involuntary expressions of soul-life, which quite unintentionally make it plain to all who can grasp their significance that such a soul has seized upon the substantial import of all that confronts it with the richest quality of spiritual insight, that its reflective capacity, however, is not carried further by positive expansion into the general environment of particular interests, motives, and finite aims, but rather preserves its original purity that the fact it refuses to have its powers dissipated by the commonplace excitements of the heart and the serious quests and modes of sympathy which are thus inevitable, may remain unknown to the world.

(*γ*) A time must, however, arrive for a soul of this type in which it becomes uniquely affected at one definite point of attachment in that inward worlds it concentrates the whole of its undivided powers in one supreme form of emotion that dominates its life-current; it adheres to this with a force that refuses to be diverted, and secures happiness therein, or goes to ground from lack of support. To retain a hold on life a man requires a constantly expanding breadth of ethical sustenance, which alone supplies an objective stability. To this type of character belong some of the most fascinating figures in romantic art, whose full perfection of beauty we shall find among the creations of Shakespeare. As an illustration we may take the Juliet in his "Romeo and Juliet." It is possible at this moment to see a

reproduction of this play in this city[278]. It is well worth going to. The picture we have given us there of this character is a moving, lifelike, passionate, talented, highly finished and noble one. But for all that it is possible to entertain a somewhat different conception of the part. In other words, we may figure for ourselves a maiden in the first instance simple as a child, of only fourteen or fifteen years of age, who, it is quite clear, has as yet no self-knowledge or world wisdom, no emotional activity, no strong inclination or wishes of the heart, but has rather glanced into the motley show of the world as into some *laterna magica* without learning anything from it, or reflecting upon what is seen there. All in a twinkling we behold the development of the entire strength of this soul, of its artfulness[279], its circumspection, its force; it is prepared to sacrifice everything and to submit itself to the severest ordeals, so that in its entirety it now suddenly appears to be the first breaking forth of the full rose in all its petals and folds, an infinite outburst of the innermost purity which gushes from the spring source of the soul, in which it had held itself back previously as yet undiscerned, unmoulded and undeveloped; which moreover, as the now existing creation of *one* awakened interest, betrays itself unpremeditated in the fulness and strength of its beauty from the previous seclusion of spirit. It is a brand which one spark has kindled, a bud which at the first bare touch of love breaks unawares before us in full bloom. And yet the faster it unfolds the more rapidly it also sinks, and its petals fall from it. An impetuous progress is still more conspicuous in the case of Miranda. Brought up in seclusion we have her portrayed for us by Shakespeare at the critical moment when she first makes the acquaintance of manhood[280]. He depicts her in a few scenes, but in those we get a picture that is complete and unforgettable. We may also include Schiller's Thecla under the same type, despite the fact that it is rather the creation of a reflective kind of poetry[281]. Though placed in the midst of a life of such amplitude and

richness she remains unaffected by it; she remains within it without vanity, without reflection, purely absorbed by the one interest which alone dominates her soul. And as a general rule it is chiefly the beautiful and noble natures of women, in which the world and their own heart-life blossoms for the first time in love, so that it is as though their spiritual birth here takes its rise.

Under the same type of spiritual intensity, which is unable fully to unfold itself, we may for the most part classify those folksongs, more particularly our German ones, which, in the copious compactness of the soul-life therein reflected, and however much such is displayed to us as carried away by any one absorbing interest, are yet unable to express the same except in broken flashes, and thereby fully reveal just this very depth. It is a mode of artistic presentment, which in its reserve is apt to fall back on the effects of symbolism. What it offers us is not so much the open, transparent display of the entire inward life as it is purely a *sign* and indication of that life. But we do not get, however, from it a symbol, the significance of which, as was the case previously, remains a general abstraction, but an expression the inward content of which is nothing more nor less than this personal, living, and actual soul. In times like our own, dominated by a critical reflectiveness, which lies so far removed from a self-absorbed *naïveté* of this kind, such presentations are of the greatest difficulty, and if successful, are a sure proof of an original creative genius. We have already seen that Goethe, more particularly in his lyrics, has shown himself a master in this respect, namely, that he can depict and unfold to us in a symbolical way, in other words with a few simple, apparently external and insignificant traits, the entire truth and infinite wealth of a soul. His poem, "The King of Thule," one of his most lovely bits of poetical work, is of this class. The king here makes us aware of his love by just one thing only, namely, the drinking cup which the old man preserved as a gift of his beloved. The old carouser stands up there

on the point of death in his lofty palace hall; his knights, his kingdom, his possessions are around him; and he bequeaths them all to his heir, but the goblet he flings into the waves; no one shall have that.

Er sah ihn stürzen, trinken,
Und sinken tief in's Meer,
Die Augen thäten ihm sinken,
Trank nie ein Tropfen mehr[282].

A soul, however profound and still of this kind, which retains its energy of spirit pent up like the spark in the flint, unopened to form, which does not elaborate its existence and reflection beyond its own boundaries, has also failed to free itself by such expansion. It remains exposed to the remorseless contradiction that, if the false note of unhappiness ring through its life, it possesses no remedial aptitude, no bridge as a way of passage between the heart and reality; it is equally unable to ward off external conditions from itself, and by so doing to preserve an independent ground of vantage in its own self-reliance. When the collision comes therefore it is helpless; it acts hastily and without circumspection, or bows passively to the movement of events. So, for example, we have in Hamlet a beautiful and noble soul; one not so much spiritually weak, but one that wanders astray without a strong grasp of life's realities, moving in an atmosphere of dejection, a sombre and half articulate melancholy. Gifted with a finely intuitive sense he feels that all is not well with him, that things are not as they should be though he has no external sign, no single ground for suspicion; nevertheless he surmises the atrocious deed that has been perpetrated. The ghost of his father gives yet closer embodiment to his feelings. He is at once ready in spirit to revenge, his sense of duty is always before him reflecting the innermost craving of his heart, but he is not carried away with the flood, as Macbeth; he cannot either kill, rage, or

strike with the directness of a Laertes; he persists in the inactivity of a beautiful, introspective soul, which can neither realize its aims nor make itself at home in the conditions of actual life. He dallies, seeks for more positive certainty buoyed up by the fair integrity of his soul; he can, however, come to no firm decision, much as he has sought it, and permits himself to follow the course of external events. In this atmosphere of unreality he goes yet further astray in matters that lie directly in his path; he kills the old Polonius instead of the king; he acts in a hurry where he should have been more circumspect, yet persists in his self absorption, where decided action is essential; until at length, without any action on his part, the fated *dénouement* of the entire drama, including that of his own persistently self-retiring personality, has unravelled itself on the broad highway of Life's external incidents and accidents.

We are particularly presented with this attitude in modern times among men of the lower levels of life, who are without an education which extends to aims of universal significance, or are devoid of the variety of objective interests. Consequently when some *particular* aim of their life fails they are unable to secure any further stay of their spiritual forces and a centre of control for their activities. This lack of education tends to make reserved natures, in proportion as it is undeveloped, adhere with the more rigidness and obstinacy to that which, through its appeal to their entire individuality, makes a claim upon them however limited in its range it may be. We find pre-eminently such a monotonous attitude incidental to this class of self-absorbed and speechless men among German characters, who for this reason appear in their seclusion inclined to stubbornness, ready to bristle up, crabbed, inaccessible, and in their dealings and expressions wholly unreliable and contradictory. As a master in the delineation and exposition of such obtuse characters of the poorer classes we will mention but one example, Hippel, the author of "Life's Careers in the Line of Ascent,"[283] one

of our few German works stamped with original humour. He keeps himself wholly removed from Jean Paul's sentimentality and want of taste in plot construction, and possesses moreover an astonishing individuality, freshness, and vitality. He understands, in quite an exceptional way, and one that seizes on our interest at once, how to depict the thickset type of people who are unable to breathe freely and who consequently, when they do give themselves the rein, do so with a violence that is simply fearful. They put an end of their own accord to the infinite contradiction of their spiritual life and the unhappy circumstances in which they are involved in an appalling manner; and bring about by such means that which is otherwise the result of an external fate, as we find, for instance, in "Romeo and Juliet," where external accidents mar all the wise and able offices of the holy father's intervention and cause the death of the lovers.

(*c*) We find, then, that characters of this formal quality generally either expose merely the infinite volitional force of the individual's personality, which asserts itself frankly just as it is and storms ahead in the bare impulse of the will; or, to take the further aspect, present to us an essential self-contained[284], if not wholly articulate soul, which, affected as it becomes by one specific aspect of its spiritual experience, concentrates the entire breadth and depth of its personality on this point, yet, owing to the fact of its possessing no development externally, is unable to find its proper place or to act with practical sense when it comes into collision with that world. We have yet a *third* point[285] to mention, which consists in this, that when characters of this type, wholly one-sided and restricted as they are in respect to their aims if at the same time fully developed in mental power, awake in us not merely a *formal*, but also a *substantial* interest, we cannot fail to receive the impression that this limitation of their personal life is itself only a condition that is inevitable; in other words it is a result which grows out of the particular way in which their character is defined along with the

profounder content of their personal life. Shakespeare in fact enables us to see this depth and wealth in such characters. He presents them to us as men of imaginative power and genius by showing how their reflective faculty commands them and lifts them above that which their condition and definite purpose would make them, so that they are all the while as it were forced by the misfortune of circumstances and the obstacles of their position into doing that which they accomplish. At the same time we do not mean this to the extent of asserting, for example, that the bad witches were to blame for all that Macbeth dared after consulting them. These witches are rather to be looked at as the reflex of his own obstinate will. All that the characters of Shakespeare execute, that is the particular purpose they propose, originates and finds the taproot of its force in their own personality. But along with this they maintain in one and the same individuality a loftiness, which brushes aside that which they actually are, so far as their aims, interests, and actions are concerned, and which amplifies them and exalts them above themselves. In like manner Shakespeare's more vulgar characters, such as Stephano, Trinculo, Pistol, and that hero among them all, Falstaff, though saturated with their own debasement, assert themselves as fellows of intelligence, whose genial quality is able to take in everything, to possess a large and open atmosphere of its own, and in short makes them all that great men are. In the tragedies of the French on the contrary even the greatest and most worthy characters only too frequently, if viewed critically, assert themselves as so many evil offshoots of the brute creation, whose only intelligence consists in this that it can furnish dialectical arguments in its vindication. In Shakespeare we find neither vindication nor damnation, but merely a review of the general condition of destiny, which inevitably places such characters uncomplaining and unrepentant where they are, and from the starting-point of which they see everything, themselves included; and yet as independent spectators of themselves decline and fall.

In all these respects the realm which is peopled by such individual characters is an infinitely rich one, a kingdom, however, which very easily collapses in hollowness and dulness, so that only quite a few masters have received the gifts of poetical and intuitional power sufficient to enable them to reveal its truth.

2. THE SPIRIT OF ADVENTURE

Now that we have examined the aspect of the inward soul-life, which may, at this stage of our inquiry, be presented by art, we must direct our attention to that which lies without it, to the particularity of circumstances and situations which affect character, also to the collisions in which its development proceeds, and finally review the entire collective form, which this inward life assumes within the boundaries of concrete reality.

It is, as we have more than once pointed out, a fundamental determinant of romantic art, that the spiritual sense, in other words, the soul in its aspect of self-reflection, should constitute a whole, and relates itself for this reason to the external world, not, in its own reality, inter-penetrated by this world, but as though related to something purely external and separated from it, which goes on its way independently disjoined from Spirit, is thus evolved, and thus disposes of itself as a finite and continuously fluid, changing, and complicate object of contingent causality[286]. To the self-absorbed soul it is as wholly a matter of indifference what particular circumstances it confronts, as it is an affair of chance what those circumstances are which appear before it. For in its action it is less a matter of importance that it should carry out a work whose essential basis is rooted in itself and owes its subsistency to its own character than that it should generally make itself effective in action.

(*a*) We have, in short, before us here a process which we may from one point of view describe as the rejection of the Divine from Nature. Spirit has

here withdrawn itself from the externality of phenomena, which, for the reason that the inward life no longer sees itself reflected in this sphere[287], is now independently clothed on its part under a relation of indifference exterior to the subject of consciousness. Relatively to its truth Spirit is, no doubt, in its own medium mediated and reconciled with the Absolute: but in so far as we now take up our position on the ground of self-subsistent individuality, which proceeds from itself as it discovers itself in its immediacy, this divesting of the Divine[288] affects character in its active capacity. It moves forward, that is to say, with its own contingent aims into a world equally subject to chance, with which it fails to unite itself in an essentially harmonious whole. This relative character of purpose in an environment which is relative, whose determination and development does not subsist in the individual mind, but is defined externally and contingently and is responsible for collisions equally adventitious, which appear as offshoots that are unexpectedly interwoven with it, creates that to which we give the name of "the adventurous," which supplies the *fundamental type* of romance for the mode of its events and actions.

It is necessary that the action and dramatic event in so far as they apply strictly to the Ideal and classic art, should be referable to an essentially true or, in other words, independently explicit and necessary end, in whose conformation that which is also the determinating factor for the external form, for the particular type and mode of execution, is an object of real existence. In the case of the acts and events of romantic art this is not the case. For, although essentially universal and substantive ends are also presented in their manner of realization by this type, the definition of the action which is referable to such ends, and the principle of co-ordination and articulation which appears in its progress on its spiritual side[289] is not the direct result of those ends themselves; this aspect of realization is inevitably left independent and subject to the operation of contingency.

(*α*) The romantic world had one and only *one absolute* work to accomplish, namely, the extension of Christendom, and the bringing into manifest performance the spirit of the community[290]. Situated in the midst of a hostile world consisting in part of the unbelieving ancient *régime*, and in part of a human life which was barbarous and coarse, the character of its actual accomplishment, in so far as it passed from mere theory to deeds, was, in the main, the passive endurance of pain and torture, the sacrifice of its own temporal existence for the eternal salvation of the soul. A further product of its energies, which is equally a portion of the same essential content, is, in the Middle Ages, that carried out by Christian Chivalry, the driving forth of the Moors, Arabs, and Mohammedans generally from Christian countries, and, above all, along with it, the conquest of the Holy Sepulchre in the Crusades. This, however, was not an object which affected man simply as human[291], but one which a mere collection of isolated individuals had to accomplish under conditions in which the individuals which composed it streamed together at their own free will and pleasure as such. From such a point of view we may call the Crusades the collective adventure of the Christian Middle Ages; an adventure, which was essentially subject to lapses[292], and fantastical, of a spiritual tendency, and yet devoid of a truly spiritual aim, and in its relation to action and character delusive. For in its relation to the processes of religion, the supreme object of the Crusades is in the highest degree empty and external. Christianity purported to secure its salvation solely in Spirit, in Christ, who is raised to the right hand of God; it finds its living reality and stay in Spirit, not in the grave of Spirit, or in the sensuous, immediately present localities of its former temporal abiding-place. The impulse and religious yearning of the Middle Ages, however, was centred on the spot, the external locality of the Passion and the Holy Sepulchre. In just the same direct contradiction with the religious object we find that wholly worldly one which was bound up

with conquest; a possession, which in its relation to the secular world, carried a totally different character to that of a truly religious purpose. Men would fain win for themselves what was spiritual and health to their souls, and they set before them as an aim a purely material locality, from which Spirit had vanished; they strained after a gain that was temporal, and united this which was of the world to the pure substance of religion. It is this distraction which gives us the discordant and fantastic note in such enterprises in which we find that which is of the world confound the life of soul, or the latter prove the confounding of the former instead of a harmony which is the result of both. And for the same reason much that is contradictory appears in the execution unresolved. Piety is carried to the point of rawness and barbarous cruelty. And this rawness permits every kind of selfishness and passion to break forth, or casts itself conversely once more upon the eternal depths which either move or bruise the human spirit, and which are, in truth, the heart and substance of the matter. In the medley of elements so discrepant, there is also an absence of all unity in the object proposed by the exploits and events themselves, or in the consequential power of authority. The host of men is diverted and split up in single adventures, victories, defeats, and a variety of accidents; and the outcome of it all fails to correspond to the means and enormous preparations which were involved. Nay, the object itself is stultified in the execution. For the Crusades would once again bring truth to the sentence: "Thou couldst not leave him in peace in the grave, thou didst not suffer thy holy one to see corruption." But it is precisely this longing to find Christ and spiritual content in such places and spaces, even the grave itself, the place of death, which is itself, whatever essential worth even a Chateaubriand may make out of it, a corruption of Spirit, out of which Christianity must rise in resurrection in order to return once more to the fresh and abundant life of the concrete world.

An object of much the same kind, mystical from one point of view, equally fantastical from another, and adventurous in its undertaking, is the search of the Holy Grail.

(*β*) A more exalted emprise is that which every man has to go through in his own domain, his life, in the course of which he determines his eternal destiny. It is this object which Dante has, consistently with the catholic standpoint, seized upon in his "Divine Comedy" as he conducts us in turn through hell, purgatory, and paradise. In this poem, too, despite the strenuous co-ordination of the whole, we have abundant evidence of conceptions which are fantastic[293], aspects that are suffused with the spirit of adventure, in so far, at any rate, as this work in its blessing and cursing is not carried through merely in the explicit form of universal statement, but as referable to an almost innumerable company of distinct personalities, not to mention the fact that the *poet* takes upon himself the *fiat* of his church, seizes the keys of heaven in his hand, adjudicates both bliss and damnation, and so constitutes himself the judge of the v world, who places the best known individuals both of the ancient and Christian eras, whether poets, citizens, cardinals, or popes, respectively in hell, purgatory, or paradise.

(*γ*) The remaining material, on the basis of the *worldly* life, which leads up to action and event, consists in the infinitely manifold and venturesome experiments of imaginative idea, all that element of chance in what arises either without or within the soul from love, honour, and fidelity. At one time we may see men thus affected box the compass for their own reputation's sake, at another leap to help persecuted innocence, carry out amazing exploits in defence of the honour of their lady, or vindicate some right that is invaded with the strength of their own arm, and the able use of their own weapons; and this albeit the innocence which is delivered prove only a company of knaves. In the majority of such cases there is absolutely no

condition, no situation, no conflict before us in virtue of which we can assert that action follows as a *necessary* result. The soul simply wills it and *intentionally* looks out for adventure. The exploits of love, for instance, in such cases have for the most part, if we look at their more specific content, no other real principle of determination beyond the effort to give proof of the steadfastness, fidelity, and constancy of love, to testify that all the surrounding world, together with the entire complexus of its relations, is merely of value as so much material in which love may be brought to light. For this reason the specific act of such manifestation, since the only thing that matters is the proof, is not determined by its own course, but is left dependent on a freak of chance, the mood of the lady, the caprice of external accidents. The same principle holds where the objects are honour or bravery. They are proper to an individual who holds himself far aloof from all further content of a more substantive character, who is perfectly able to enter into any and every content as it may chance to occur, to find himself the object of insult therein, or to look for an opportunity in which he may display his courage and shrewdness. As we have here absolutely no criterion as to what should or what should not form part of this content, in the same way also we have no principle in accordance with which we can fix what in each case is really an attack upon honour or the true subject-matter of bravery. It is just the same with the treatment of *right*, which is likewise an object of chivalry. In other words, right and law are here not as yet asserted as a condition and object which is of essentially independent stability, or as a system which is continuously made more perfect in accordance with law and its necessary content, but as themselves purely the product of individual caprice, so that their interposition, no less than the judgment passed upon that which in every particular case is held to be right or wrong, is throughout relegated to the entirely haphazard criteria of individual judgment.

(*b*) What we have before us generally, more particularly on the secular field, in chivalry and the formalism of character above indicated, is not merely, to a more or less degree, the contingency of the circumstantial conditions of human action, but also that of the soul in its attitude of volition. For individuals of this one-sided characterization are capable of accepting as the substance of their life that which is wholly contingent, conduct that is only sustained by virtue of the energy of their character, and is carried out, or fails in its contact with the inevitable collisions which the condition of the world opposes to it. The same thing is true of the chivalry which receives in honour, love, and fidelity a more lofty ground of justification, and one entitled to rank with a truly ethical basis. On the one hand, it is still emphatically a matter of chance on account of the particular aspect of the circumstances on which it reacts; we find that here the object is to carry out aims peculiar to some particular person, instead of some work of general significance, and the modes of its attachment with the rest of life fail to possess independent stability. On the other hand, precisely at the point where we consider such action as part of the personal life of individuals, we are aware of the presence of caprice and illusion in respect to all that it either projects, originates, or undertakes. The net result of such a spirit of enterprise consequently, through all that it performs or enters upon, no less than in its ultimate effects, is no other than a world of events and fatalities which is self-dissolvent, a world of comedy for this very reason.

This self-dissolution of Chivalry we find set before us and artistically reproduced, pre-eminently and with unsurpassed adequacy, by Ariosto and Cervantes, and, so far as it affects the fate of such highly individual characters as those above described in their isolation, by Shakespeare.

(*α*) In Ariosto, more particularly, an attempt is made to delight the reader with the infinitely varied developments of personal destiny and aims, the

fabulous complexity of fantastic relations and ludicrous situations over which the adventurous fancy of the poet plays to the point of absolute frivolity. The heroes of these dramas are seriously engaged in what is often unadulterated folly and the wildest eccentricity. And, to note especial points, love is frequently degraded from the Divine love of a Dante, or the romantic tenderness of a Petrarca, to sensual tales and ludicrous collisions; or heroism appears to be screwed up to a pitch that is so incredible it ceases to amaze, and merely excites a smile over the fabulousness of such exploits. By virtue, however, of this indifference in respect to the particular manner in which dramatic situations are brought about, astonishing complications and conflicts are introduced, broken off and once more interwoven, chopped about, and finally resolved in a surprising way; yet, despite his ludicrous treatment of chivalry, Ariosto is as able to secure and display to us the true nobility and greatness which we may find in chivalry, or the exhibition of courage, love, honour, and bravery, as he can on occasion excellently depict other passions, cunning, subtlety, presence of mind, and much else.

(β) Just as Ariosto inclines more to the *fabulous* element in this spirit of adventure, Cervantes develops that aspect of it which is appropriate to *romantic* fiction. We find in his Don Quixote a noble nature in whose adventures chivalry goes mad, the substance of such adventures being placed as the centre of a stable and well-defined state of things whose external character is copied with exactness from nature. This produces the humorous contradiction of a rationally constituted world on the one hand, and an isolated soul on the other, which seeks to create the same order and stability entirely through his own exertions and the knight-errantry which could only destroy it. Despite, however, this ludicrous confusion we have still in Don Quixote that which we have already eulogized in Shakespeare. Cervantes has created in his hero an original figure of noble nature endowed

with varied spiritual qualities, and one which at the same time throughout retains our full interest. In all the madness of his mind and his enterprise he is a completely consistent[294] soul, or rather his madness lies in this, that he is and remains securely rooted in himself and his enterprise. Without this unreflecting equanimity respectively to the content and result of his actions he would fail to be a truly romantic figure; and this self-assuredness, if we look at the substantive character of his opinions, is throughout great and indicative of his genius, adorned as it is with the finest traits of character. And, further, the entire work is a satire upon the chivalry of romance, ironical from beginning to end in the truest sense. In Ariosto this genius of adventure is merely the butt of frivolous jest. From another point of view, however, the exploits of Don Quixote are merely the central thread around which a succession of genuinely romantic tales are intertwined in the most charming way, in order to unfold the true worth of that which the romance in other respects scatters to the winds with the genius of comedy.

(*γ*) In somewhat the same way as we thus have seen chivalry, even in respect to its most momentous interests, overturned in comedy, Shakespeare, too, either places the characters and scenes of comedy in juxtaposition to his downright and stable individualities, and tragic situations and conflicts, or exalts the essential figures of his drama through a profound humour above themselves and their uncouth, limited, and false purposes. Falstaff, the fool in "Lear," the musician scene in "Romeo and Juliet," will sufficiently illustrate the first alternative, and Richard III the second.

(*c*) The dissolution of romance, in the sense we have hitherto regarded it, introduces us finally and in the third place to the spirit of the *novel*[295], in our modern sense of the term, which historically the knight-errantry and pastoral romances precede. This spirit of modern fiction is, in fact, that of chivalry, once more taken seriously and receiving a true content. The

contingent character of external existence has changed to a stable, secure order of civic society and state-life, so that now police administration, tribunals of justice, the army and political government generally take the place of those chimerical objects which the knight of chivalry proposed to himself. For this reason the knightly character of the heroes who play their parts in our modern novels is altered. Confronted by the existing order and the ordinary prose of life they appear before us as individuals with personal aims of love, honour, ambition, and ideals of world reform, ideals in the path of which that order presents obstacles on every side. The result is that personal desires and demands unroll themselves[296] before this opposition to unfathomable heights. Every man finds himself face to face with an enchanted world that is by no means all that he asks for, which he must contend with for the reason that it contends with himself, and in its tenacious stability refuses to give way before his passions, but interposes as an obstacle the will of some one else whoever it may be, his father's, his aunt's, or social conditions generally. For the most part such a knighthood will consist of young people, who feel it incumbent upon them to hew their way through a world which makes for its own realization rather than that of their ideals, and who hold it a misfortune that there should be family ties, civic society, state laws, professions, and all the rest of such things at all, because conditions of such solidity and so inevitably restricted are so cruelly opposed to their ideal dreams and the infinite claims of their souls. The main object now is to drive a breach through this wall of facts, to change, to improve, or at least carve for themselves in despite of it some little heaven on earth such as they seek for, their ideal maiden, discover her, win her from the clutches of her wicked relations or her evil circumstances, carry her off and lay the balm of love on her wounds. Conflicts of this kind, however, in our modern world are the apprentice years, the education of individuality in the actual world; they have no further significance, but the

significance has, nevertheless, a real value. The object and consummation of such apprenticeship consists in this, that the individual drops his horns and finds his own place, together with his wishes and opinions in social conditions as they are and the rational order which belongs to them, that he enters, in short, upon the varied field of life, and secures that position within it which is appropriate to his powers. However soundly he may have rated the world and have been shoved on one side, the day comes at last with the most of us when the maiden is discovered and some kind of place in the world, he marries, and is as much a Philistine as the rest of his neighbours. His wife takes charge of his domestic arrangements; children do not fail to put in an appearance; the adorable wife who was so unique, an angel, acts very much as other wives do; the profession supplies its toils and vexations, the married tie its domestic sorrows, and, in short, we have the entire process of marital caterwauling once more illustrated. In this history we may see the same old type of the adventurous spirit with this distinction, that here that spirit discovers its real significance, and all that is wholly fantastic in it receives its necessary correction.

3. THE DISSOLUTION OF THE ROMANTIC TYPE OF ART

The last point which we have to establish still more closely is that relatively to which the romantic spirit, for the reason that it already is *intrinsically* the principle of the dissolution of the classic Ideal, manifests, in fact, this *dissolution* clearly as such a process. In this connection it is of the first importance to consider the ultimately complete contingent and external character of the material, which the activity of the artist seizes on and informs. In the plastic material of the plastic arts the spiritual conception is so related to the external medium that this external show is the embodiment which uniquely belongs to that spiritual significance itself, and possesses no

real independence apart from it. In romantic art, on the contrary, in which we find the inwardness of Spirit withdraws within its own domain, the entire content of the *external* world secures the freedom of unfettered independence and the assured subsistency of its own peculiar character and particularity. Conversely, as we have seen, if the personal life of soul forms the essential feature in the artistic product, it is a question of similar indifference with what specific content of external reality and the spiritual world the soul is vitally connected. The romantic Idea can therefore assert itself through *every* sort of condition; can embrace every conceivable position, circumstance, relation, aberration, confusion, conflict, and means of satisfaction; it is simply its own personal and self-subsistent mode of conformation, the expression and receptive form of the soul rather than any objective independently valid form which is the object of search and is made good. In the representation of romantic art therefore everything has its due place, all the departments and phenomena of life, the greatest and the least, the highest and most insignificant, what is moral with that which is immoral and evil. And we may further note in particular that the more secular the art becomes, the more it amasses the finite wealth of the world, the more it takes to it with, delight, bestows upon it a validity that is without reserve and exists for the artist in such a world under the sole condition that it is reproduced in its naked reality, so much the more is art at home with itself. Thus we may observe in Shakespeare, on account of the fact that with him the action as a rule runs its course in the most realistic association with objective life, and is isolated and broken up in a mass of purely accidental relations, and conditions of every kind, the least important and most incidental no less than the most sovereign flights and most weighty interests of poetry are each and all substantiated. So in "Hamlet" we have the sentry on watch no less than the royal court; in "Romeo and Juliet" the domestic *ménage*; in other pieces, not to mention clowns, swashbucklers, and all the

vulgarities of ordinary life, we have pot-houses, carriers, chamber-pots and fleas, much as in the representations by romantic art of the birth of Christ and the adoration of the kings we do not fail to find oxen and asses, mangers and straw[297]. And this is the kind of thing throughout, that the scriptural text may receive its fulfilment, too, in art, "they that are of low estate shall be exalted." It is from out this contingent sphere of its subject-matter, which in a measure asserts itself as merely the environment of a content intrinsically more important and in part also in absolute independence, that the *downfall* of romantic art issues, to which we have already above adverted. In other words we have, on the one hand, objective reality placed before us in what is from the point of view of the Ideal its *prosaic objectivity*, that is, the content of everyday life, which is not grasped in the substantive form in which it adumbrates what is both moral and divine, but rather in that which is for ever changing and which as temporal passes away. And, in the further aspect of it, it is also the *subjective condition*, which, with its emotion and insight, with the principle and authority of its wit or humour, is able to exalt itself in mastery over the entire world of the real, a mastery which leaves nothing in the ordinary connections and significance where the commonsense consciousness finds it, and is not fully satisfied until it has proved that everything which is a part of that world is, by virtue of the form and relative position which it receives from the view of it, mood and supreme gifts of the artist[298], itself intrinsically capable of being broken up, and, as such, is for the artistic vision and feeling dissolved. We have now, in this connection, first, to add a few words on the principle contained in those very varied works of art whose level of representation approximates closely to the ordinary appearance of objective or external reality, what in common parlance is called the imitation of Nature.

Secondly, we shall have to discuss humour as a personal quality in the artist. It plays a very considerable part in modern art, and is that which in the case of many poets distinctively supplies the fundamental character of their work.

Thirdly, it remains for us to offer a few suggestions, in conclusion, on the point of view from which it is still possible for the art of to-day to find a field for its activities.

(*a*) *The Artistic Imitation of what is Immediately presented by Nature*

The realm of subjects which may be included in this sphere v of artistic activity may be extended indefinitely for the reason that Art takes for its content here not that which is by its own inherent law necessary[299], the range of which is essentially self-contained, but the contingent phenomena of reality in their unlimited modifications of form and relation, Nature and her kaleidoscopic play of separate pictures, the everyday action and affairs of man in his dependence on natural conditions and their means of his satisfaction, in his accidental habits also, attitudes, activities of family life, his business as a citizen, and, generally, the incalculable variety of all that shifts and changes in the world around us. And for this reason this art is not merely, in the broad sense that applies more or less to the romantic spirit in all its manifestations, a type of portraiture: rather it tends to lose itself completely in the mode of its portrayal, whether it be in sculpture, painting, or in the descriptions of poetry. The tendency is to return to the exact imitation of Nature, in other words, to the intentional approach to the contingent aspects of what is immediately before the vision and independently thus presented, prosaic existence in all its ugliness no less than its beauty. The question, therefore, at once suggests itself whether productions of this character have any right to be called art at all. No doubt, if we simply fix before our attention the notion of artistic work which fully corresponds to the Ideal, work which from one point of view it is of the first

importance that their content shall not be thus intrinsically accidental or evanescent, and from another point of view that their mode of presentation must be adequate in all respects to such a content, then such artistic productions as we are now considering will unquestionably appear to fall short. On the other hand, there is another fundamental aspect of art which assumes here an exceptional importance. This is the conception and execution of a work of art which are personal to the artist, the aspect, that is, of an individual talent, which is able to remain true to the inherently substantive life of Nature no less than the embodiments of spiritual experience though carried to the very limits of contingent condition with which they may be involved, and which is further competent through the vividness of its truth to import a significance into that which is by itself insignificant, no less than by the amazing ability of the technical execution itself. We have consequently to consider here the degree in which the soul, that is, the genius and vitality of the artist, is able to enter into the very being of such objects — whether we consider their dominant idea[300], or the purely external form of their appearance — and thus makes them visible in his art to our eyes. And if we look at it from this point of view it will be found impossible to deny that such creations have a genuine claim to the name of art-products.

If we approach such more closely we shall find that among the particular arts poetry and painting are the ones which are most occupied with their subject-matter. For, on the one hand, we see here that it is that which is itself essentially particular which supplies their content, and on the other hand it is the accidental though in this type of art the genuine peculiarities of the objective appearance which is sought for as the mode of the reproduction. Neither the arts of architecture, sculpture, or music are adapted to the fulfilment of such a task.

(*α*) In poetry it is ordinary domestic life — the main source, that is, of the probity, commonsense spirit, and the morality of everyday[301] life — which is presented by art in the usual developments of civic life, in scenes and characters selected from the middle and lower classes. Among the French Diderot stands out conspicuous for the way in which he has thus insisted on natural effects and the imitation of the bluntness of fact. Among Germans it was Goethe and Schiller who, with more lofty aim, struck out a path somewhat similar in their youth, but rather, within this naturalness of life itself and its particular detail, sought after a profounder content and conflicts of essential significance. And in contrast to them we have Kotzebue and Iffland, both of whom, in their several ways, the first with a superficial rapidity of conception and execution, the second with a more conscientious accuracy of detail and a homely kind of morality, gave us the counterfeit of the daily life of their time in the prosaic picture of its more limited aspects, with but a limited sense, either of them, for genuine poetry. And generally, we may say, that it is German art more than any other, and particularly that of our own times, which has fastened with delight on this kind of treatment till it has reached a sort of. virtuosity in it. In fact for a long period back Art was more or less something of a stranger and a guest in our country, not the child of our own loins.

Further, we may observe that in this attraction to the reality that lies actually before us it is essential that the material assimilated by such an art be cognate with such reality and at home in it[302]; it must be the national life of the poet and his immediate public. It is on this very point of the kind of appropriation suited to an art such as our own, which carried the purpose both in its content and its methods of representation of making us feel at home in it, even to the extent of sacrificing both beauty and ideality, that the impulse originated which led to such a type of artistic production. Other nations have been inclined to reject such material with scorn, or only in

more recent times have taken a more vital interest in such opportunities as the ordinary course of human life offers.

(*β*) If we desire, however, to see what is most worthy of our admiration in such productions, we must turn our attention to the later genre-painting of the Dutch. We have already in the first part of this work, when examining the intrinsic character of the Ideal, indicated, so far as the general spirit of it is concerned, what we take to be the substantial basis of such work[303]. That contentment in life under its presentment of direct experience down to the most ordinary and most insignificant detail is mainly due to the fact that this people was obliged to work out for itself only after severe struggles and hard labour that which Nature supplies with far less reserve to other peoples. Further, circumscribed as it is by local conditions, it has become great in this very concern for and appreciation of the least things. From another point of view it is a people of fishermen, sailors, citizens, and peasants, and for this reason is forced from the start to rate highly all that may be useful and necessary both in matters of greatest and least importance which it knows how to secure with the most assiduous industry. As a further essential feature of its development the religion of this Dutch folk was Protestantism, and it is an exclusive characteristic of this form of religion that it seeks to find a home in the prose of life and suffers the same to remain just as it is by itself, and independently of religious associations, and to retain its forms of growth in unrestricted freedom. It would be quite impossible for any other nation, situated in other external conditions, to create works of art of such pre-eminent quality from the kind of material which we have placed before us in the Dutch school of painting. And, moreover, despite the peculiar nature of this artistic interest, the Dutch have not by any means discovered their whole life-in what was necessitous or barren in the conditions of their existence and what tended to oppress their vitality: on the contrary, they have reformed their church itself, have

overcome a religious despotism precisely as they overcame the world-power and majesty of Spain, and have finally through their exertions, their industry, their bravery and thrift secured for themselves, in the consciousness of their self-attained liberty, prosperity, comfort, rectitude, courage, joviality, nay, even a superabundant sense of the joys of ordinary existence. Herein lies the vindication of the typical subject-matter of their art. The material of such an art will not, however, satisfy that profounder significance which is due to a content that is essentially true. If, however, neither our emotional nor our critical faculties are wholly content with it the more we consider it closely the more we shall feel reconciled to such defects. It is an essential part of the art of painting and the man who paints that they should please and carry us away with that sense of pleasure. And, to put it bluntly, if we would really know what painting is, in looking at any particular canvas we must be, at least, able to say of the master in question: "Ah, this man can paint." The main point, therefore, does not turn on the question how far the artist in his work is able to give us an exact transcription of the object he presents before us. We have already the completest vision of grapes, flowers, stags, sand-hills, sea, sun, sky, the finery and decoration of ordinary life, horses, warriors, peasants, smokers, teeth-extraction, and every kind of domestic scene. We have only to go to Nature for such things and others like them. What ought to captivate us is not the content in its bare reality. Rather it is the appearance, which in comparison with the object is wholly without interest[304]. This appearance is, moreover, by itself fixed independently of the beautiful[305], and art consists in the mastery of its reproduction of all the mysteries of the ever self-deepening appearance of external phenomena[306]. And, above all, the function of art consists in this that, armed with an exceptionally fine sense for such things, it lies in ambush for the momentary and wholly transient traits which it finds upon the surrounding world observed in its individual

aspects of life, aspects which, however, completely coincide with the universal laws that dominate the appearance, and can retain true and secure the most fading apparition. A tree, a landscape, is something of independent and permanent stability. But to seize upon the flash of a metal, the gleam of light through the grape, a vanishing glance of the moon or the sun, a smile, the expressions of spiritual life which are no sooner seen than they vanish, or ludicrous movements, situations, and attitudes, to master such evanescent material as this is the difficult task of this type of work. If classic art in its Ideal has essentially confined its embodiment to that which is purely substantive so here we have opened to our vision the changes of Nature in their fleeting forms of expression, a stream of water, a waterfall, waves of foam on the sea, still life with the accidental flashes of glass, plate, and things of like nature, the outward appearance of man in the most exceptional situations, a wife, for instance, threading her needle by candle-light, a halt of robbers suddenly surprised, the most instantaneous fraction of some human posture, the smile or sneer of a peasant, all the things, in fact, in which men like Ostade, Teniers, or Steen are masters. It is the triumph of art over the Past, in which the substantive is likewise filched of its power over that which is accidental and transitory.

And just as the appearance simply as such reflects the real content of objects, so we may say that Art, in giving a permanent form to the evanescent show of things, goes a step further. In other words, quite apart from the objective realization, the means adopted in the reproduction are themselves independently an end, in the sense that the individual ability of the artist, and his use of the means his art supplies, may itself rank as one of the objects aimed at by the art product. In quite the early days of the school the artists of the Netherlands studied profoundly the qualities of colour in its relation to material substances[307]. Van Eyck, Hemling, and Schoreel[308] were all of them capable of imitating in the most realistic way the sheen of gold

and silver, the varied light effects of jewels, silk, velvet, and fur-stuffs. A mastery of this kind which, by the magic of colour and the mysteries of its enchantment, is able to bring about artistic results so entirely surprising requires no further vindication; it justifies itself. As Spirit in thought and in its grasp of the world by means of ideas and thoughts reproduces itself, so what is most important here is the individual recreation of the external world, independently of the bare object itself, in the sensuous medium, of colours under effects of light and shade. It is in fact a kind of objective music, a system of colour tones. In music the single tone is of no value and only produces the musical effect in its relation to some other, in its opposition, concord, modulation, and unison. It is precisely the same thing with the music of colour. If we consider the appearance of painted colour closely such as the gleam of gold or the flash from the steel of battle we shall only see a number of white or yellow dashes, points, coloured surfaces. The single colour alone does not possess this gleam which we gather from the picture. It is only by its association with other tints that we get the effect of glitter and flash. Take for example the Atlas of Terburg; every individual strip of colour here alone is simply a dull gray, more or less whitish, bluish, or inclining to yellow: only when we take in the entire effect from a distance, which gives us the relative contrast of each part to the rest, dawns upon us the beautiful soft sheen which is true of the genuine Atlas. And it is just the same with our velvet effect, play of light, exhalation of cloud and so on through all pictorial effect whatsoever. It is not so much the reflex of the artist's mood[309], which, as is no doubt frequently the case with landscape, transfers itself to the objects delineated, as it is the entire ability of the artist, which seeks to make itself felt in this objective way as the use of the means at his disposal in such a vital interaction that they themselves straightway of their own cunning bring to birth a world of objects.

(*γ*) And consequently the interest in the objects delineated tends to revert to the fact that it is the unique powers of the artist himself which are thus consciously displayed, and for which the embodiment of a work of art, independently complete and self-composed, is not of so much importance as a production in which the creative artist unveils to us simply his genius. In so far as this *personal* aspect is no longer concerned with the external means of presentation but affects the *content* itself of the work, the art becomes thereby the art of caprice and humour.

(*b*) *The Humour of Personality*[310]

In humour it is the personality of the artist, which so reproduces itself both in its particular idiosyncrasies and profounder content, that the main thing of importance is the spiritual value of this personality.

(*α*) Inasmuch as humour does not so much propose to itself the task of unfolding and informing an objective content according to its own essential character, and, by artistic means, of articulating and rounding it off in such a self-evolved process, as it consists in the artist's own self-manifestation in the material, he will be mainly concerned to let everything which tends to become an object and to secure the rigid lines of reality, or which appears in the external world, fall away and dissolve under the powerful solvent of his own fancies, flashes of thought and arresting modes of conception. By this means every appearance of self-subsistency in such a content, the embodiment of which is secured in its coalescence through means of a given fact, is entirely destroyed, and the product is now simply a play with certain objects, a derangement or a turning upside down of a given material, the enterprise of a rover throughout such, the interwoven woof of the artist's own expression; views and moods, through which he gives free scope to himself quite as much as to his immediate subject-matter.

(*β*) The illusion which readily springs from such a type of art consists in this, that though it is a very easy matter to make either oneself or the object

given the butt of drollery and wit, and for this reason the form of humorous composition is that frequently adopted, yet quite as often as not we find that the humour is dull enough when our artist gives free rein to any chance conceits or jest which may occur, which in their loose and patchy connections range to excess beyond all reasonable limits, and with intentional eccentricity bind up frequently together the most alien matter. Some nations have proved themselves indulgent to such artistic experiments, others are more severe. Among the French such attempts at humorous composition have not as a rule been successful; we Germans have done better, and we are more tolerant to the defects of such a style. Jean Paul, for instance, is a much admired humourist among us; and yet it would be difficult to point to any writer who is more eccentric in the way he brings to the common fund what is most remote from his subject, and patches together an incredibly motley assemblage of subjects, whose sole bond of relationship is one of the artist's own fancy. The story, the matter and progress of events are the features of least interest in his romances. The main attraction throughout is the sportive procession of his humour which uses everything in its course as a means to establish his own triumph as a humourist. In this subordination to itself and concatenation of every conceivable stuff that can be raked out of the four quarters of the world, or the realm of the real, the material of humour approximates once more to that of symbolism, wherein significance and conformity likewise are disjoined, with this difference, however, that in the former it is purely the personality of the poet which commands the material no less than the significance, co-ordinating them according to his own caprice[311]. Such a series of freaks and fancies soon tires us, more particularly when we are expected to live as best we can in the not unfrequently barely decipherable combinations which have passed somehow or another in the clouds of the poet's brain. With Jean Paul, as with scarce another, one metaphor, sally of

wit, drollery, or simile proves the death of its neighbour. Nothing grows; there is an explosion, that is all. A plot, however, which purports to have a *dénouement* must first be unfolded and prepared for such solution. From another point of view, when the artist in question is essentially devoid of the solid core and support of a mind and heart overflowing with the real actualities of existence, his humour very readily lapses into what is sentimental and morbid. And in this respect Jean Paul is no less an example.

(*γ*) In a humour of the best kind, which keeps itself aloof from such excrescences, we must therefore have a genuinely spiritual depth and wealth, able to exalt that which issues as the emanation of a personality to the rank of real expression, and capable of making that which is truly substantive arise from that which the chance suggestions, the mere caprices of the artist, dictate. The self-abandonment of the poet in the course of his exposition must be, as it is with humourists such as Sterne or Hippel, a wholly unembarrassed, easy-going, scarce perceptible kind of saunter[312], which, insignificant though it appear, manages precisely by that means to strike at the root of the main idea; and, for the reason that what thus bubbles up in haphazard fashion are matters of detail, it is essential that the conception, which binds the whole ideally together, should have the deeper foundation, and that such detail should simply flash forth the focal spark of genius.

We have now arrived at the point where romantic art itself for the present terminates. It is the standpoint of our most modern outlook, whose distinctive characteristic we shall find to be mainly this, that the individual personality[313] of the artist stands supreme above both the material he informs and his creation. He is no longer dominated by the conditions of an essentially restricted sphere, in which he must accept as given both the content and form of his work; it now lies in his power to choose either as he wills, and to retain both on similar terms.

(*c*) *The End of the Romantic Type of Art*

Art, in so far as it has hitherto been the subject of our inquiry, had for its fundamental basis the unity of significance and form, and, as a further type of it, the unity of the personality of the artist with the work he embodies and creates[313]. More closely defined we may say that it was the specific type of this union, which supplied the content and its appropriate artistic presentment with the substantive and directive principle running through all the images therein.

We found at the commencement of our inquiry with reference to the origins of art that in the Eastern world Spirit was not as yet independently free. It still sought that which it conceived to be the Absolute in the domain of Nature, and apprehended the natural as itself essentially Divine. At a further stage the outlook of classical art set before itself the vision of the Greek Pantheon as unconstrained and inspired beings, but still in all essential features formed as our humanity, as individuals charged with a positive physical process[314]. Finally it was romantic art which first permitted Spirit to penetrate the depths of its own world, in contrast to which flesh, the external reality and frame of this world generally, albeit the fact that the spiritual and absolute could alone manifest itself in this world, in the first instance was divested of all claim to reality[315], but for all that afterwards asserted such a positive claim with increasing strength and urgency.

(*α*) These distinctive views of the world process constitute religion, the substantive Spirit or genius of peoples and eras; they not merely influence art, but are threads of life which permeate every other domain or province of the living present to which they belong. As every man, in every sphere of activity, whether it be on the field of politics, religion, art, or science, is a child of his own age, and receives the task to elaborate the essential content and consequently the inevitable plastic form of that age, so, too, the aim that

determines the content of art is no other than that of finding in its own medium and resources some adequate expression for the spirit of a nation. So long as the artist is in immediate identity and unshaken faith inextricably one with the determinate content of such a view of the world and the religion where it culminates, to that extent this content and the mode of its presentation will call forth his most *serious* powers; in other words this content remains for him the infinite substance and truth of his own consciousness, a content, with which he lives, down to the inmost recesses of his spiritual nature, in original unity; and, moreover, the embodied presence in which he reveals the same is for him as such an artist[316] the final, necessary, and highest type of such a form, namely that of bringing before the aesthetic sense the absolute being[317] and the ideal significance[318] of the subject-matter of his art. It is through that aspect of his material which is no other than his own immanent substance[319] that he finds that which binds him to the specific mode of his exposition. For the material, and with it the form that appertains to it, carries the artist directly into himself[320], as being the real essence of his determinate being, which he does not imagine but rather actually is, and consequently has only to make this essential part of him an objective fact to himself, to conceive and elaborate such in a vital form from his own resources. Only under such conditions is the enthusiasm of the artist fully awakened for either the content or manifestation of his art; only thus his creations become no mere product of caprice, but spring up within him, out of him, out of this living field of his substance, this spiritual capital, whose content never ceases to be active, until, through the efforts of the master, it has attained a defined form adequate to its own ideal notion. When, however, we of to-day would seek to make a Greek god or, as our own Protestants try to do, a Virgin Mary the object of a piece of sculpture or a picture, it is impossible for us to treat such a material with entire seriousness. It is the faith of our inmost heart

which fails us here, albeit even in ages of absolute belief the artist was by no means necessarily what is commonly understood as a pious mart, any more than at any time artists generally come in an exceptional sense under that category. The demand is rather simply this that in the view of the artist his content should be no other than the substantive significance, the most spiritual truth of its own conscious life, and that it should unfold the necessary laws of its mode of presentation. For an artist is, in his creative activity, a child of Nature; his ability is in one aspect a talent he receives from *her*. His method of working is not the pure activity of rational apprehension, which places itself in direct opposition to its material, and unites with it in the medium of free thoughts and pure thinking. Rather, as one not yet released from the natural aspect, it[321] coalesces immediately with the object, in full faith, and is identical with it heart and soul. The artistic personality reposes frankly in the object, the work of art proceeds in like manner absolutely from the unimpaired spiritual depth and power of genius; the product is *ferme*, unwavering, and its entire intensive effect preserved. And this it is which supplies the fundamental condition of the final demand that Art be presented us in its flawless totality.

(*β*) The situation, however, has entirely changed in view of the position we have been forced to indicate as that occupied by Art in this its final stage of evolution. We have, however, no reason to regard this simply as a misfortune which the chance of events has made inevitable, one, that is to say, by which art has been overtaken through the pressure of the times, the prosaic outlook and the dearth of genuine interests. Rather it is the realization and progress of art itself, which, by envisaging for present life the material in which it actually dwells, itself materially assists on this very path, in each step of its advance, to make itself free of the content that is presented. In the very fact that we have an object set before our ocular or spiritual vision, whether it be by Art or the medium of Thought, with a

completeness which practically exhausts it, so that we have emptied it, and nothing further remains for our eyes to discover or our souls to explore, in that alone the vital interest disappears. Our interest only continues where our faculties are kept fresh and alive. Spirit only concerns itself actively with objects so long as there is still a mystery unsolved, a something unrevealed. And this is so so long as the material remains identical with our own substance. A time comes, however, when Art has displayed, in all their many aspects, these fundamental views of the world, which are involved in its own notion, no less than every province of the content that is bound up with such world-views: when that time arrives such art is necessarily cast loose of that which has been its previous specific content for any particular people or age; in such a case the renewed craving for material to work upon only fully awakes when it is accepted as inevitable that we must first bid farewell to all that its activity has previously substantiated: just as in Greece, for example, Aristophanes opposed a resolute face to his age, and Lucian to the entire historical Past of his country; or in Italy and Spain, in the decline of the Middle Ages, both Ariosto and Cervantes opened the attack on Chivalry.

In opposition to the age, then, in which the artist, by virtue of the concrete content of his nationality and times, stands within a definite outlook upon the world and its modes of embodiment, we become aware of a point of view diametrically antagonistic, which, so far as its complete enunciation is concerned, has only in the most modern times received its due significance. It is only in our own days that we find the artist no less than the man of science among pretty nearly all civilized nations, has mastered the cultivation of his reflective faculty, the art of criticism, and among us Germans the absolute freedom of thought, and has made this critical apparatus, both relatively to the material and the form of its production, having already run through all the necessary phases or types of

romantic art, a kind of *tabula rasa.*[322] The specific mode of association for any particular context, and a manner of presentment exclusively pertinent to that and no other material, are things which the artist of to-day looks upon as obsolete. Art has become a free instrument which is qualified to exercise itself relatively to every content, no matter what kind it may be, agreeably to the principles or criteria of the artist's own peculiar craftsmanship. The artist stands superior to all specific modes and conformations, however much hallowed in the usage, and moves forward free and independent, untrammelled by either form or presentment such as previously have brought before man's vision and mind the one holy and eternal substance. No content, no form is any longer identical directly with the inmost soul of the artist[323], his nature, his unaware[324] and substantive essence; every material he may treat with indifference, if he only keep true to the formal principle that he make his work consonant with beauty and a really artistic execution. There is, in short, no material nowadays which we can place on its own independent merits as superior to this law of relativity; and even if there is one thus sublimely placed beyond it there is at least no absolute necessity that it should be the object of *artistic* presentation. For these reasons the artist is situated relatively to the content of his work much as the dramatist who places before us and develops other and alien characters. It is quite true that even our poet of to-day interposes the atmosphere of his genius within his delineations, and the warp that he weaves is in fact that of his own substance; but this only applies to what is universal there or wholly accidental. The closer traits of individualization are not his own, but rather he makes use of in this respect his stores of images, modes of metaphor, earlier types of art, which by themselves he does not care for, and whose significance is exclusively dependent on the fact that they turn out to be the most suitable for this or that matter in hand. In most of the arts, and particularly in the plastic types, the subject-matter is, apart from this,

supplied from outside to the artist. He works to order, and when occupied with whatever tales, scenes, and portraits thus come in his way, whether sacred or profane, has merely to look to it that he can make something out of them. For, however much he leaves the impress of his genius on a given content, it remains throughout for all that a material which is not itself directly the substance of his own conscious life. Nor is it of any real assistance to him, that he further appropriates, so to speak, with his soul and substance views of the world that belong to the Past, in other words, tries to root himself in one of such, and, let us say, turns Roman Catholic, as not a few have done in recent times for Art's sake, in order to give their soul some secure foundation, and enable the definite lines of their artistic product to become themselves something which shall appear to have an independently valid growth. It is not a prime condition of the artistic state that the artist should come completely to terms with his own soul, or should be obliged to look after his own salvation. What is important is that his soul in its greatness and freedom should from the first, before it thinks of creating, both know and possess that whereof it is, should stand fast by it and reliant within it; and, above all, is it indispensable that the spirit and mind of the great artist of to-day should have a liberal education, one in which every kind of superstition and belief which remains limited to circumscribed forms of outlook and presentment, should receive their proper subordination as merely aspects or phasal moments of a larger process; aspects which the free human spirit has already mastered when it once for all sees that they can furnish it with no conditions of exposition and creative effort which are, independently for their own sake, sacrosanct; and only ascribes to them value in virtue of the loftier content, which itself, as creator and worker, he reposes in them, making them thus what they ought to be[325].

It is somewhat in this way nowadays that any and every form and material may prove of service to and under the control of the artist whose executive talents and genius have been liberated in their independence from the former limitation to a specific mode of artistic work.

(*γ*) If we ask, then, in conclusion what are the content and the modes which may be considered *peculiar* to the present sphere of our inquiry, the result will be approximately as follows.

The universal types of art were pre-eminently related to the absolute truth to which Art attains, and they discovered the source of their differentiation in the specific grasp they respectively supplied of that which passed for the Absolute in the human consciousness, and which itself carried the principle of its manner of embodiment. In this respect we have already seen in symbolism Nature's significances pass before us as content, and her facts and human personification as the mode of presentation; similarly in the classical type, we have passed in review spiritual individuality, but as bodily presence which carried no memory with it[326], and over which the abstract necessity of Fate stood paramount. In the romantic the intellectual being of the personal consciousness was asserted inherent in its own substance, and for the inmost content of which the external form remained entirely contingent. In this concluding type as in the earlier ones the object of art was the Divine in its explicitly unfolded nature. This Divine had however to make itself an object, to define itself, and in the process to pass from its own immediate substance to the secular content of the personal consciousness. In the first instance the infinite essence of personality was reposed in honour, love, and fidelity; after that in the particular individuality, the specific character which happened to coalesce with the particular mode of human life in question. This coalescence, together with the specific limitation of content appropriate to such, was finally put an end to by humour, which proved itself capable of dissolving

or making pliable to its purpose any or every line of stable definition, and by so doing made it possible for art to transcend its own limitations. In this passing away of Art beyond itself, however, Art is quite as truly the return of man upon himself, a descent into his own soul-depths, by which process art strips off from itself every secure barrier set up by a determinate range of content and conception, and unfolds within our common humanity[327] its new holy of holies, in other words the depths and heights of the human soul simply, the universal shared of all men in joy and suffering, in endeavour, action, and destiny. From this point onwards it is from himself that the artist receives his content, is in truth the Spirit of man assigning to himself his own boundaries, contemplating, experiencing and giving utterance to the infinitude of his emotions and situations, a spirit to which nothing is any more alien which can possibly emanate as life from the human soul. A content of this nature is one which cannot persist under the defined modes of art independent and apart from the activity of the artist. Rather the definition of content and its elaboration is transferred by it to the caprice of his invention. But, despite of this, it excludes no vital interest, because Art is no longer under constraint to represent that, and only that, which is completely at home in one of its specific grades. Everything is now possible as its subject-matter, in which man, on whatever plane of life he may be, possesses either the need or the capacity of making his abode.

Confronted with a material of such a wide range and multiplicity, it is above all of first importance that in respect to the mode of artistic treatment the Spirit that is now active in our present life should throughout declare itself as such. Our modern artist may no doubt join the company of ancients and elders. It is a fine thing to be one of the Homerides, though we stand last of the line; pictures, too, that reflect for us once again the atmosphere of romantic art in the Middle Ages will have a worth of their own. But this universal sufficiency, depth, and unique suitability of a given material such

as we above described is another thing altogether, and equally so its mode of presentation. Neither Homer, Sophocles, Dante, Ariosto, nor Shakespeare can reappear in our times. What has been sung so greatly, what has been expressed with such freedom, has been sung and expressed once for all. Only the Present blows fresh; all else is faded and more faded. In the matter of history we must fain make it something of a reproach to the French, and we may add to it a criticism on the score of beauty, that they have presented on their stage Greek and Roman heroes, Chinese, and Peruvians as so many French princes and princesses, and moreover have given them the motives and views peculiar to the age of Louis XIV or Louis XV. Yet, after all, had these very motives and opinions only been intrinsically deeper and more beautiful than they are we should have had little fault to find in the fact that the Past is here translated into Art's present life. On the contrary all material whatsoever, it matters not from what age or nation it hails, only retains its truth for art as part of this vital and actual Present, in which it floods the human heart with the reflected image of its own life, and brings truth home to man's senses and mind. It is just this revelation and renewed activity of that humanity which is immortal in all its varied significance and infinite reconstruction, which, in this its receptacle of human situations and emotions, forms the possible no less than the absolute content of the art of our time.

If we now take a glance back, having established in a general way the content which distinguishes the subject-matter of this portion of our inquiry, at that which we finally considered to be the modes of romantic art's dissolution, we may recall the fact that we then defined them under a term applicable to all, as the falling to pieces of Art, a process which, in one of its aspects, was due to an imitation of the objects of Nature in all the detail of their contingent appearance, and in another was referable to humour, that unfettered activity of the individual soul in all its capricious mastery. In

conclusion, we may still draw attention to a further way of fixing on our minds that *terminus* of romantic art without prejudice to our previous remarks upon it. In other words, just as in our advance from symbolism to classical art, we considered the transitional forms of image, simile, and epigram, we have also here in romantic art a form somewhat similar worthy of attention. In those previous modes of conception the important thing was the falling asunder of the spiritual significance and the external form, a severation which in part was cancelled by the activity of the artist's own mind, and in the exceptional case of the epigram could possibly be converted into complete identity. Romantic art was from the beginning the profounder disunion of that inmost soul-life which finds its satisfaction in its own wealth, which, moreover, for the reason that generally the objective world does not completely satisfy the demand of Spirit essentially as such, persisted in its discordance with or indifference to it. This opposition in the evolution of romantic art finally led us perforce to the point where we found that the interest was exclusively centered on the contingent aspects of externality, or the equally capricious activity of the soul. When, however, this exclusive attention to either side, whether it be the externality or purely personal presentment, agreeably to the main principle of romantic art, is carried so far that it becomes a real penetration of the soul within the object, and the aspect of humour in its relation to the object and its embodiment within the sphere of its own individual reaction[328] assumes a real importance, in that case we are face to face with what is a coalescence[329] with the object, and is nothing less than an *objective* humour. Such a coalescence, however, can only be of limited range, and find expression merely, say, within a lyric, or at most in but a portion of a larger composition. For if its boundaries widened, and it was carried throughout the object-matter in question, it would necessarily become identical with the action and event, become, in short, a completely objective representation.

What we have to consider here is rather a sensitive self-abandonment of the artist's soul in his object, which no doubt is unfolded in some kind of process, but nevertheless remains a movement of the imagination and heart indicative rather of *individual* genius; a caprice in some sort, and yet not entirely capricious or intentional, but rather a sympathetic expansion of the artist's genius, which devotes itself solely to its subject-matter, and makes it exclusively its interest and content.

We may usefully compare with such a spirit the last blooms of the ancient Greek epigram, in which this type appears in its first and simplest features. The mode we have here in our mind is in the first instance apparent when the reference to the object is not a mere statement of fact, is not merely an inscription or transcript which states what the object is, but is associated with a deeper emotion, a sleight of witticism, an ingenious fancy, or a real flash of imaginative power, any or all of which through their poetical grasp give life to and expand the minutest detail. Poems of this description, it matters little what their subject-matter may be, whether a tree, a mill-stream, spring, dead things or alive, are of infinite variety and may be found in the literature of all nations. They are, however, a subordinate grade of poetry, and very readily come off halting. For at least in a country of cultivated speech and reflection there are few objects and conditions, indeed, which will not offer some further link of association to every man. And just as the average man thinks himself qualified to write a letter he will rate his capacity to express such ideas. One is very easily tired of a universal spirit of sing-song such as this, even though a stray novelty of touch may be here and there thrown in. The importance of such a class of composition, therefore, depends almost entirely on the question how far the artist's soul, with its full intensity of life, and with a spiritual and intellectual wealth that is both profound and extensive, has without reserve entered vitally into such conditions, situations, and so forth; has made a

home there, and from the object in question created something unseen before, something beautiful, something essentially worth our attention.

To this end the Persians and Arabians pre-eminently in the oriental splendour of their images, in the unfettered enjoyment of their imagination, which enters into the being of its subject-matter in the purest spirit of contemplation, offer, even for present times and our own intensity of spiritual penetration, a glorious exemplar. Both the Spaniards and Italians, too, have done excellent things in the same direction. It is true that Klopstock says of Petrarch:

— Laura besang Petrarca in Liedern,
Zwar dem Bewunderer schön, aber dem Liebenden nicht[330].

but Klopstock's own love-odes are themselves full of moral reflections, troubled yearning and passion that is for ever writhing after immortality of happiness. What we admire most in Petrarch is the free atmosphere of essentially noble emotion, which, however much it expresses the longing for the beloved, can none the less repose on its own heart. For this kind of longing, indeed sensual desire itself, is far from being absent in the range of the art we now are considering, when the subject is restricted to wine and love, the tavern and the glass; the excessive voluptuousness of the images of Persian writers themselves are in fact an illustration of this; but in this case the imagination, in the interest it possesses for the intelligence, removes the object entirely from the sphere of desire which has a practical aim. It possesses an interest merely in the realm of its own exuberant activity, finding its delight freely in its own countless freaks and fancies, and making joys and griefs alike the subject of its sport Among our modern poets the two who preeminently combine a similar buoyancy of genius with a more intimate and spiritually searching depth of imagination are Goethe in his "Westöstlicher Divan" and Rückert. The essential contrast between

Goethe's poetry in the "Divan" and his more early efforts is quite remarkable. In his "Welcome and Farewell," for instance, the language and description are no doubt fine in their way, true feeling is there. In other respects the situation is commonplace, the climax is poor, and of imagination in the full and free sense there is no further trace. The poem in the "Divan" entitled "Recovery"[331] is composed in a totally different spirit. Love is here wholly absorbed in the imagination, and the movement, happiness, and bliss of the latter are throughout predominant. And, to speak generally of artistic productions of this class, we may affirm that we find in them no personal craving, no indications of enamourment, no mere desire, but a pure delight in the objects delineated, an inexhaustible self-absorption of imagination, an innocent play, a free surrender to the coquettish humours even of rhyme and ingenious versification; and withal an intense jubilation of the soul in its own free movement, a spirit, which, by means of this very exhilaration induced by artistic form[332] lifts the soul high above all its painful perplexity into the ordered limits of the real.

And here we must close our consideration of the particular types according to which the Ideal of art throughout its process is self-differentiated. We have made these several modes the subject of a more extensive inquiry, with a view to unfolding the content of the same, a content from which the proper modes of artistic presentment are themselves also deducible. For in Art, too, as in all other human production, it is the content which is finally decisive. In fact Art, if we consider the true notion of it, has one and only one supreme function. It has to set forth in adequate form, within the grasp of our actual senses, what is itself essential content; and the Philosophy of Art should consequently regard it as its main business to comprehend in Thought what this abundance of content and its beautiful mode of manifestation verily is.

[256] *Subjektivität.*

[257] *Für andere*, that is for other spiritual beings than the absolute Spirit as such.

[258] *Die Innigkeit.*

[259] *Aus dem Innern exzeugten.*

[260] *Sich in sich hineinbildend.* That is by continually supplying new modes to the subjective spiritual content — until we arrive at the almost purely spiritual mode of music.

[261] *Die innere Auflösung.*

[262] The phenomenal world of Nature.

[263] *Die Verwickelungen.*

[264] *Die Abentheuerlichkeit.* Hegel means that it is like the result of an adventure — unforeseen rather than “fantastic.”

[265] *Ein individuelles Subjekt.*

[266] That which supplies its own justification.

[267] Lit., unenclosed, that is open indefinitely and so undefined, unsounded.

[268] That is, it is open to extraneous causes that cannot be predicted from the mere essential notion of them.

[269] I presume this is the meaning of the expression *das Aussergöttliche* and *das partikulär Menschliche.*

[270] *Pralle* — stiff, metallic in its steeply rigidity.

[271] Act I, sc. 5.

[272] *Miserabilität.* One of Hegel’s own coinage.

[273] An unknown work to me.

[274] *Ein inneres Werden.*

[275] One is reminded of the Mohammedan fatalism. It is Allah.

[276] *In einfacher Gedrungenheit.* Hegel means that it is tightly self-sealed, that and nothing more.

[277] *Hineingelegtseyn.* The reference of the whole being to one object.

[278] This was the representation which took place in Berlin in 1820, with Mademoiselle Erelinger as Juliet.

[279] *List*, usually in depreciatory sense, here otherwise.

[280] With the exception, of course, of her presumed father Prospero.

[281] That is, a poetry based rather on the reflective faculty than the creative imagination.

[282]

"He saw it plunge, drink boldly,
Then sink in sea-depths lost;
And what his eyes saw loosed him,
No drop the king drank more."

[283] *Lebensläufe in aufsteigender Linie.*

[284] *In sich totales, unbeschränktes Gemüth.* The expressions would appear to contradict one another, but the emphasis is on the unity of a whole which is itself not fully defined.

[285] It is not so much a third type as a way of looking at the previous ones.

[286] It is contingent, of course, to the individual. Hegel does not mean that it is without causality.

[287] The sphere of objective fact.

[288] From Nature, that is.

[289] *Ihres inneren Verlaufs.* I suppose Hegel means action under the aspect in which it forms a part of the individual development — regarded in its relation to will and consciousness.

[290] That is, the Christian community.

[291] *Den Menschen als Menschheit*, that is in his generally secular aspect.

[292] I presume this is the sense of *gebrochen* here. But lower down it would mean apparently *discordant.*

[293] By "fantastic" Hegel seems to me to mean that which is based on a fancy or imagination that is wholly personal to the artist, and so adventitious in its results.

[294] *Sicheres Gemüth*— "consistent" both in its literal and metaphorical senses — one that holds together and is thus self-assured.

[295] *Das Romanhafte.* I cannot think of an English expression which exactly corresponds.

[296] *Sich schrauben*, like the winding smoke from a bottle — the corkscrew — ironical of course.

[297] One of the finest illustrations of such a universality of interest may be found in Ruskin's description of Tintoret's "Adoration of the Magi."

[298] *Genialität* and *genial* mean a good deal more than our English words geniality and genial — they refer directly to genius.

[299] *Das in sich Nothwendige.* The reference is mainly to the stricter principles of classical art.

[300] *Nach ihrer ganzen Inneren.*

[301] Lit., "Which possesses for its substantial content (*Substanz*) the integrity (*Rechtschaffenheit*), world-wisdom (here I think no more is meant than "good sense") and the morale of daily life (*des Tages*)."

[302] Lit., "That the material, so far as art appropriates it, be immanent and at home in that reality." *Immanent* must I think refer back to *die vorliegende Werklichkeit.*

[303] Vol. I, pp. 229, 230.

[304] That is it has no interest *quâ* a natural object.

[305] *Scheinen* must mean here natural rather than artistic appearance. Natural appearance is not *necessarily* beautiful.

[306] *Des sick in sich vertiefenden Scheinens.* It is self-deepening in proportion to the *feiner Sinn* below mentioned.

[307] I think this is the meaning of the expression *das Physikalische der Farbe* — not so much the material constituents of colour as the effect of colour on physical substances. But either interpretation makes sense.

[308] An artist unknown to me.

[309] *Gemüth*. I think Hegel uses the word here in the narrower sense rather than "soul" generally.

[310] *Der subjektive Humor.*

[311] Lit., "And arranges them side by side in an alien order." That is, under a principle of co-ordination which does not lie in the subject-matter.

[312] *Unscheinbares Fortschlendern.*

[313] *Die Subjektivität des Kunstlers.* The expression as used here and below implies, of course, not so much the formal personality or character as the individual spirit and its resources.

[314] I presume this is the meaning of *von einem affirmativen Momente.*

[315] Lit., "Was at first posited as naught."

[316] That is, as an artist for whom it is *wahrhafter Ernst.*

[317] *Das Absolute* here is, I think, referable to the subject-matter of art rather than to be taken as "the Absolute" simply.

[318] *Die Seele.* Perhaps "vital principle" would be better.

[319] That is, Spirit or mind.

[320] There is an uncorrected misprint here, *der* should be *den* and *tragen* would be an improvement on *trägt.*

[321] I am not certain whether the subject is here the artist himself, or his mode of working. The context would suggest the latter, the better sense the former.

[322] Reflection has destroyed the *necessity* of any particular form.

[323] That is the life of Spirit. *Das Heilige und Ewige.*

[324] *Bewusstlosen.* His spiritual nature in its unexplored universality is, I presume, the sense.

[325] *Als ihnen gemäss.* As adequate to their completely explicit nature.

[326] *Aber als leibliche unerinnerte Gegenwart.* I am not sure that I know precisely the sense here, unless it amounts to this that the Greek gods were without an historical memory. Their immortality swallowed up in its repose the sense of beings in time, and assumed to be in human bodily shape.

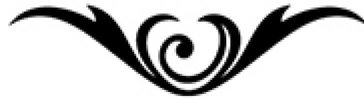
[327] *Zu ihrem neuen Heiligen den Humanus macht*, an uncommon phrase.

[328] *Innerhalt seines subjektiven Reflexes.* That is, the synthetic activity of humour's reflection.

[329] *Verinnigung*, a stronger word than *Vereinigung.*

[330] "Petrarch sang songs of his Laura. To him who wonders at beautiful songs they are beautiful, to the lover they are not so."

[331] "*Wiederfinden*."



[332] I am not quite sure that *die Heiterkeit des Gestaltens* does not mean "the buoyancy of the created form."

THIRD PART

THE SYSTEM OF THE PARTICULAR ARTS

INTRODUCTION

THE OBJECTS TREATED by our science in the *first* part were the general notion and the reality of beauty in Nature and art, in other words beauty in its truth, and art in its truth, the Ideal in the as yet undeveloped unity of its fundamental principles, independent of its specific content and its distinguishing modes of envisagement.

This essentially genuine[1] unity of the beautiful in art, in the *second* place, unfolded itself within its own resources in a totality of art-forms, whose determinate structure defined at the same time the content which the art-spirit was impelled to fashion from itself in an essentially articulate system of manifestations of beauty under which the Divine and human is envisaged to the world.

What still is absent from both these spheres is the reality that is present within the elementary substance of the *external* phenomenon itself. For although both in our examination of the Ideal as such, and in that of the specific modes of symbolic, classical, and romantic art, we throughout referred to the relation or complete mediation which obtains between the significance conceived as an ideal principle and its embodiment in the external or phenomenal *materia*, yet this realization merely retained its validity as that which was still exclusively the *ideal* art-activity in the sphere of general world-impressions[2] of beauty, in and through which it is diffused. Inasmuch, however, as the fundamental conception of beautiful implies, that it make itself objective for the immediate vision, that is to say for the senses and sensuous perception as an external work of art, so that what is beautiful becomes only then itself through such a definite form appropriate to itself explicitly united with the beautiful and the Ideal, we

have in the *third* place to review this territory of the art-product as actually self-realized in the entirely sensuous medium. For it is only through this final configuration that the work of art is truly concrete, an individual entity which is at once real, self-contained, and singular. The Ideal can only constitute the *content* of this third sphere of our aesthetic philosophy for the reason that it is the idea of the beautiful, in the collective totality of all its world presentments, which is thus self-realized in objective form[3]. For this reason the art-product is still, even up to this point, to be conceived as a totality articulated in itself, nevertheless as an organism, whose organic parts, which — while in the second part of our inquiry they were differentiated under a collective concept of essentially disparate world-aspects — now fall asunder as isolated members, every one of which becomes independently a self-subsistent whole, and in this singularity is capable of bringing into display the totality of the different art-types. Essentially and in accordance with its notion it is quite true that the collective result of this new reality of art belongs to *one* single totality. Inasmuch, however, as it is a portion of the realm of the sensuous[4] present, in which the same is made real to itself, the Ideal is now resolved into its phasal states as a process[5], and confers on them an independent and self-subsistent stability, albeit they are capable of coming into juxtaposition, essential relation, and reciprocal reintegration with one another. And this real world of art is the system of the *separate* arts. Just as then the particular types of art, regarded throughout as totality, expose intrinsically a process, an evolution, that is, of the symbolical to the classical and romantic types, we find also, on the one hand, a similar advance in the particular arts, in so far as it is the very art-types themselves which receive their determinate existence through these specific arts. From another point of view, however, the particular arts have also themselves within them a process, a progression, independently of the art-types to which they attach an

objective reality, a process which in this its more abstract relation is *common to all.* Every art possesses its spring-time of perfected elaboration as art, and on the one side or the other a history that precedes or follows this period of full-bloom. For the products of the arts collectively are spiritual products, and consequently are not at once to hand in their own specialized province respectively, as are the forms of Nature, but are subject to a beginning, progression, completion, and termination, a growth, a blooming, and a decay.

These more abstract differences, whose devolution we propose at the very commencement of our inquiry briefly to indicate, since it asserts itself equally in all the arts, are identical with that which it is usual to define under the name of *rigorous*, *ideal*, and *approved* style, when indicating the specific styles of art in each case, which are mainly related to the general mode of embodiment and representation, partly as considered in its external shape, and its possession or lack of spontaneity, its simplicity, its surfeit of detail, briefly in all its various aspects, according to which the definition of the content emerges in the external appearance; partly no less in its aspect of the technical elaboration of its sensuous material, in which the art in question gives determinate existence to its content.

It is a common assumption that art finds its beginnings in what is devoid of complexity and is *natural.* In a certain sense, no doubt, we may accept this as true. In other words what is rude and barbarous is without question, when contrasted with the genuine spirit of art, something both nearer to Nature and less complex. What is, however, natural, vital, and simple in art, regarded as fine art, is something quite different to this. All beginnings which are merely simple and natural, in the sense of uncouthness, do not as yet belong to the province of art and the beautiful at all as, for example, in the case where children scrawl simple figures, and with a few formless

strokes would indicate thereby a human form, a horse, and so forth. Beauty, considered as a spiritual product, demands even from the start an elaborate technique, implies a long series of experiment and practice. Simplicity, when we refer to it as the simplicity of the beautiful, its ideal proportions, is rather a result, which only succeeds in overcoming the variety, medley, confusion, excess and incumbrance of its matter, and in concealing and effacing its preparatory studies, after much mediating work, so that at last Beauty, with all its unfettered spontaneity, appears to us as though liberated in one cast[6]. What we find here is very analogous to the behaviour of a man of education, who, in all that he says and does, moves simply, spontaneously, and with ease, albeit he did not by any means start in the possession of such simple spontaneity, but rather has only secured such as the result of a thorough self-training.

For this reason it is no less in accordance with the nature of the fact than it is with the actual course of history that art in its beginnings rather presents us the appearance of *artificiality* and clumsiness, running largely into incidental detail, and generally overloaded with the elaboration of drapery and the environment of its subject-matter; and precisely in the degree that this external material is more compact and multifarious, to that extent that which is really expressive is reduced to its baldest terms; in other words what is truly the free and vital expression of Spirit in its forms and motion is that which is here least in evidence.

In this respect consequently the primitive and most ancient art-products in all the particular arts are the vehicle of a content that is essentially most abstract, such as simple tales in poetry, theogonies effervescent with abstract thoughts and their incomplete elaboration, single objects of sacred association in stone and wood and so forth, and the representation remains unaccommodating, monotonous or confused, stiff and dry. More especially in plastic art the facial expression is insipid with a repose which does not so

much express spirituality in its essential penetration as a purely animal emptiness, or conversely is remorseless and exaggerated in its emphasis on characteristic traits. In the same way the bodily forms and their motion are devoid of life, the arms, for example, are glued to the body, the legs are not divided, or are clumsily moved, or in angular and constrained modes; and in other respects such figures are ill-shaped, suffer from narrow compression, or are excessively lank and extended. On the other hand we find that much more devotion and industry is spent upon accessories such as drapery, hair, weapons, and ornaments of a similar nature; the folds of the drapery remain wooden and independent, without being able to accommodate themselves to the limbs, just as we may often see for ourselves in images of the Virgin and saints of early times, where they are in part run together in monotonous regularity, and in part are continually broken up in harsh corners, not flowing freely in their lines, but scattered about with diffuseness over too wide a surface. And in the same way the first attempts at poetry are full of breaks, devoid of connection, monotonous, dominated in an abstract way by one idea or emotion, or elsewhere wild, violent, the particular being obscurely assimilated, and the whole as yet not bound together in a secure and ideal organic unity.

It is only, however, after such preparatory work as the above that the style which is the main subject of our present inquiry commences with what is truly genuine fine art. In this it is no doubt in the first instance at the same time still *austere*, but already moderated with more beauty in its severity. This severe style is the more lofty abstraction of the beautiful, which comes to a stop with that which is of real importance, expresses and reproduces the same in its broad outlines, still disdains all amiability and grace, suffers the main subject-matter alone to assert itself, and pre-eminently expends very little industry and elaboration on what is incidental. And in doing so, this severe style also still adheres to the imitation of that which is immediately

given to sense. In other words, just as, in regard to content, it takes its stand, so far as ideas and representation are concerned, in what is given it, in the tradition, for example, of a revered religion, so also, to take the opposite point of view, namely, that of external form, it will merely render assured the fact itself, and not its own invention. It is, in short, satisfied with the general broad effect that is educed from the fact, and follows in expression closely upon the growth and definite existence of this. In the same way everything that is accidental is held aloof from this type of style, in order that the caprice and spontaneity of the individual mind[7] may not appear to be involved in it. The motives are simple, the objects of representation few[8]; and for this reason no considerable variety in the detail of configuration, muscles and motion, is apparent.

Secondly, the ideal, purely beautiful style hovers between the simply substantive expression of fact and the fullest exposition of all that immediately pleases. We may define the character of this style as the highest degree of vitality compatible with a beautiful and reposeful greatness, such as we admire in the works of Pheidias or Homer. It is a living presentment of all traits, shapes, modifications of such, motions, limbs, in which there is nothing without significance and expression, but everything is instinct with life and action, and testifies to the breath, or very pulse of free life itself on the merest glance at the work of art in question; a vitality, however, which essentially makes visible one totality, and only one, is the expression of one content, of one individuality of action.

It is in such a truly vital atmosphere that we find moreover the breath of grace poured forth over the entire work. Grace is indeed a concession to the hearer and spectator, which the severe style despises. At the same time, whenever Charis, that is Grace, is asserted in the presence of an onlooker, if only as an acknowledgement, a means of conveying pleasure, yet in the ideal style we find that such a presence appears entirely divested of any

craving to confer merely pleasure. We may perhaps explain our meaning in more technical language. The fact or subject-matter is here the substantive in its concentration and self-absorption. During the process, however, that it is manifested through the medium of art, and is, so to speak, concerned to actually exist for others, to pass over, that is, from its simplicity and essential solidarity to particularization, articulation, and individualization, we may regard this development to an existent form for others as at the same time a kind of complaisance on the part of the predominant matter, in so far, that is, as it does not appear to require this more concrete mode of existence, and yet is wholly poured forth into it for us. Such a charm as this is only entitled to assert itself in such a style so long as what is really substantive also persists in undisturbed self-possession, as we may call it, over against the grace of its manifestation, which blooms forth entirely in outward guise as an original type of superfluity. This indifference of the ideal or inner self-assurance[9] for its existence, this repose of itself on itself is precisely that which constitutes the beautiful negligence of the grace, which attributes no immediate value to this, its mode of manifestation. And it is just in this that we must look for the loftiness of the beautiful style. Beautiful free art is careless in its attitude to the external form, in which it refuses to let us see any peculiar movement of the mind, or any end or intention. Rather in every expression, every modification, it points to one thing only, and that is the idea and vital principle of the whole. It is only by this means that the Ideal of the beautiful style asserts itself, which is neither harsh nor severe, but already shows the softening influence of the cheerful notes of the beautiful. Though no violence is done either to any feature of expression, any part of the whole, and every member appears in its independence, and rejoices in its own existence, yet each and all is content at the same time to be only an aspect in the total evolved presentment. This it is which alone displays, alongside of the depth and determinacy of

individuality and character, the grace of Life itself. On the one side we have indeed merely the substantial subject-matter predominant, but in the detailed exposition, in the lucid, and at the same time exhaustive variety of traits, which complete the definition of the appearance, and place it before us in its transparent vitality, the spectator is at the same time freed from the thing in its baldness, in so far as he possesses and is wholly face to face with its concrete life. By virtue, however, of the last mentioned fact, this ideal style, so soon as it carries this modification in its external aspect to yet further lengths, passes over into the so-called *agreeable* or pleasing style. Here we have the assertion of another intent than the mere vitality of the fact[10]. The giving of pleasure, the active elaboration in the direction of externality is asserted as itself an object, and is a matter of independent concern. As an example we may take the famous Belvedere Apollo, not indeed as itself belonging to this latter style, but at least marking the transition from the lofty style to that of sensuous attraction. And inasmuch as in an art of this kind it is no longer the single actuality itself to which the entire embodiment is referable, the particular details become under this mode, even though in the first instance still deducible from the central object itself and rendered necessary by means of it, more and more for all that independent. We feel that they are introduced, or interpolated, as ornaments, intentional additions of episodical import. And yet for the very reason that they are only related to the object accidentally and only receive their essential definition in a personal relation to the spectator or reader, they flatter the individual taste[11] of such, to which their workmanship is primarily directed. Virgil and Horace, for example, delight us in this respect by an educated style, in which we can trace a variety of things aimed at, and an effort deliberately made to give pleasure. In architecture, sculpture, and painting, owing to this spirit of complaisance, simple and imposing effects of size disappear, and we find on every side small pictures standing by

themselves, ornamentation, fineries, dimples on cheeks, elegant hair-dress, smiles, all the varied folding of draperies, enchanting colours and shapes, exceptional, difficult, but for all that unconstrained movements in the pose of the figure[12]. In the so-called Gothic or German art of building, where the same is carried in the direction of this spirit, we find decoration elaborated without limit, so that the whole appears to be little more than a collection of little columns with all the utmost variety of ornamentations, diminutive towers, spires, and so forth, which, in their isolation, please us, without, however, destroying the impression of the larger connections of the whole and the still insistent masses of the same.

In so far, however, as the province of art we have been discussing in its entirety gives way to this activity of externalization, this presentment of what is purely exterior, we may emphasize it in its further generalization as the *effect*, which makes use of as a means of expression what is unpleasing, strained, and colossal, the type of uncouth contrasts such as the prodigious genius of Michael Angelo often exploits to excess. The effect may be generally indicated as the excessive leaning towards an ulterior public, which results in the form no longer being asserted in its independent, self-sufficient and buoyant repose. Rather it turns round, as it were, and makes an appeal at the same time to the onlooker, and strives to place itself in a relation to him by means of this manner of presentment. Both aspects, namely essential repose and the address to the spectator, must no doubt be present in a work of art; but these aspects should fall together in complete equilibrium. If the work of art in the severe style is wholly without qualification self-contained, without any appeal to the spectator, it leaves him cold. If, on the other hand, the appeal is made too directly to him, it creates indeed a sensuous pleasure, but loses to that extent its substantive thoroughness[13], or it does so without this thoroughness of content and the simple character of the conception and delineation therein contained. This

passage from itself then merges in the accidental characterization of the appearance; as a result the image itself shares this accidental character, in which we no longer recognize the actual subject-matter and the form which is imperatively rooted in itself, but rather the poet and artist with his own personal designs, his peculiar type of production and skill. And for this reason the public is entirely released from the essential content of the work, finding itself by means of it placed in a personal relation[14] to the artist, inasmuch as everything now wholly depends on its seeing that which the artist through his art intended, that is, the cunning and personal skill which is embodied in his grasp of his subject and its execution. To be thus brought into personal community of insight and critical acumen with the artist is for most people a flattering concession; and our reader or audience, and very possibly the spectator of plastic art, with even more readiness wonder at their poet, musician, or painter or sculptor respectively; and the vanity of such is all the better satisfied in proportion as the work invites them to this personal criticism, and supplies them openly with hints of such designs and points of view. In the severe style, on the contrary, no such confidences are made over to the spectator at all. What we have is just the substantive nature of the content, which in its representation austerely, and even harshly, repulses the purely personal quest. A repulse of this kind will often be no doubt merely indicative of the spleen of the artist, who, after entrusting a profound significance to his work, instead of making the exposition of the same free, transparent, and buoyant, deliberately makes it hard to follow. A trade in mysteries of this kind is also nothing but another form of affectation, and a spurious alternative to the complaisance we have criticized.

It is pre-eminently in the work of the French school that we find this tendency to flatter, attract, and create effect, and they have in this way elaborated this easy-going and complaisant attitude to the public as the

main object of their efforts. They seek to find the real importance of their artistic work in the satisfaction such affords others, whose interest they would arouse and whom they would duly impress. This tendency is particularly marked in their dramatic poetry. Marmontel, for example, gives us the following anecdote in connection with the performance of his drama "Dénis, the Tyrant." The crisis culminated in a question asked the Tyrant. Clairon, in whose mouth this question was put, when the moment for asking it had arrived, and when actually in conversation with Dionysius, made a forward step in front of the audience and dramatically addressed them instead. By this rhetorical effect the enthusiastic support of the entire piece was assured.

We Germans, on the other hand, require too much a content in our works of art, in the depths of which the artist finds a deliverance from himself, without troubling himself about the public, who is just left to look at it, take trouble over it, and help himself out with it, as he pleases or is able.

DIVISION OF SUBJECT

Approaching now, after these general observations we have made with reference to the distinctions of style common to all the arts, the division of the third fundamental section of our inquiry we may observe that the one-sided understanding has looked about in many directions for various principles of differentiation in its classification of the specific arts severally. The true division can, however, only be deduced from the nature of the work of art, which in the entire complexus of its forms[15] explicitly unfolds the totality of the aspects and phases which are referable to its own notion. And the first thing which asserts itself in this connection as important is the consideration that art, in accordance with the fact that its presentments now have definitely to pass into sensuous reality, becomes on account of this

also art for the *senses*, so that the definition of this sense and the material medium which is applicable to it, and in which the work of art is made objective, must necessarily furnish us with the principles of subdivision in the several arts. Now the senses, for the reason that they are senses, or in other words, are related to a given material, a disparate exterior medium[16] and an essential multiplicity, are themselves different, namely, feeling, smell, taste, hearing, and sight. It is not our business in this place to demonstrate the ideal necessity of this totality and its disparate parts; that is the function of the philosophy of Nature. Our problem is limited to the inquiry whether all these senses, or if not, which of them are capable, by virtue of their notional significance, of being organs for the reception of works of art. We have already at a previous stage excluded feeling, taste, and smell. Botticher's mere feeling with the hand of the effeminately smooth portions of statues of goddesses is not a part of artistic contemplation or enjoyment at all. By the sense of touch the individual merely comes, as an individual endowed with sense, into contact with the purely sensuous particular thing and its gravity, hardness, softness, and material resistance. A work of art is, however, not merely a sensuous thing, but Spirit manifested through a sensuous medium. As little can we exercise our sense of *taste* on a work of art as such, because taste is unable to leave the object in its free independence, but is concerned with it in a wholly active way, resolves it, in fact, and consumes it. A cultivation and refinement of taste is only possible and desirable in connection with dishes of food and their preparation, or the chemical qualities of objects. An object of art, however, should be contemplated in its independent and self-contained objective presence, which no doubt is there for the mind that perceives it, but only as an appeal to soul and intelligence, not in some active relation, and with none whatever to the appetites and volition. As for the sense of *smell* it is just as little able to become an organ of artistic

enjoyment, inasmuch as things are only presented to this sense in so far as they are themselves in a condition of process, and are dissolved through the air and its direct influence.

Sight, on the other hand, possesses a purely ideal relation to objects by means of light, a material, which is at the same time immaterial, and which suffers on its part the objects to continue in their free self-subsistence, making them appear and re-appear, but which does not, as the atmosphere or fire does, consume them actively either by imperceptible degrees or patently. Everything, then, is an object of the appetiteless vision, which materially exists in Space as a disparate aggregate, which, however, in so far as it remains unimpaired in its integrity, merely is disclosed in its form and colour.

The remaining ideal sense is *hearing*. This is in signal contrast to the one just described. Hearing is concerned with the tone, rather than the form and colour of an object, with the vibration of what is corporeal; it requires no process of dissolution, as the sense of smell requires, but merely a trembling of the object, by which the same is in no wise impoverished. This ideal motion, in which through its sound what is as it were the simple individuality[17], the soul of the material thing expresses itself, the ear receives also in an ideal way, just as the eye shape and colour, and suffers thereby what is ideal or not external in the object to appeal to what is spiritual or non-corporeal.

As a third accretion to these two senses we have the *sensuous conception*, memory, the retention of images, which appear in consciousness by means of the isolated perception, in this way subsumed under universals, and become related and united to the same by means of the imagination, so that now in one particular aspect the external reality itself exists both as ideal and spiritual, while that which is spiritual from another point of view accepts under the imaginative conception the form of

what is external, and is brought to consciousness as a disparate and correlated aggregate.

This triple mode of seizing on reality offers art the well-known division into *first*, the *plastic* arts, which elaborate their content for vision in the external form and colour of objects, *secondly*, in the art of *sound, music*, and *thirdly*, into *poetry*, which as the art of *speech* uses tone merely as a symbol, in order, by means of it, to address itself directly to what is ideal in the contemplation, emotion, and imagination of our spiritual life. If we rest satisfied with this sensuous aspect of our subject-matter, as the final principle of its differentiation, we shall, in respect to our first principles, find ourselves in a difficulty, because the grounds of this division, instead of being deduced from the concrete notion of our subject-matter, are merely borrowed from the most abstract features of it. We have consequently to look about us once more for a principle of division that has deeper roots, which has, in fact, already been put forward in the introduction of this work as the truly systematic mode of dividing this third section of it. The function of art is just this and only this, namely, to bring before the grasp of the senses truth, as it is in the world of spirit, reconciled, that is, in its unity as a whole with objectivity and the sensuous material. In so far, then, as this is possible at this stage in the element of the external reality of the art-product to that extent the totality, which the Absolute is in its very truth, breaks apart into the various modes that differentiate it as a process.

The *middle point*, the truly substantive centrum, is given us here in the representation of the *Absolute*, God Himself as God, in His independent *self-subsistence*, not as yet developed to the point of motion and difference, or advanced to the active operation of and separation from what is His, but presented essentially self-absorbed in supreme divine repose and stillness, briefly the Ideal embodied in a form essentially adequate to itself, which persists in its determinate existence in correspondent identity with itself.

And in order that it may appear in infinite self-subsistency the Absolute must be conceived as Spirit, as conscious Subject, but as Subject which possesses essentially itself its own adequate mode of external appearance.

As divine subject, however, which passes forth into actual reality, it has confronting it an *external* world for environment, which, in conformity with the Absolute, must be built up to an appearance harmonious with the same, an appearance permeated with the Absolute. This environing world is then on one side the *objective* as such, the basis, the embrace of external Nature, which, taken by itself, possesses no absolute significance for Spirit, nor any ideality such as is present to individual consciousness[18], and consequently is only able to express by suggestion the spiritual Ideal which its appearance must seek to secure by embodying its embraced content in a world of Beauty.

In opposition to external Nature we find the *ideal* realm of *consciousness*[19], the human soul as the medium[20] for the existence and manifestation of the Absolute. Together with this subjectivity is conjoined the multiplicity and differentiation of individuality, particularization, distinction, action, and development, that is, in general terms the full and varied world of the reality of Spirit[21], in which the Absolute is known, willed, experienced, and actively present. We may already infer from what we have indicated above that the differences under which the total content of art is differentiated are in essential consonance, both for our grasp and presentation of them, with what we have previously in the second portion of our inquiry examined as the symbolical, classical, and romantic types of art. In other words symbolic art only carries the art-process to the point of marking an affinity between content and form, instead of their identity, of only suggesting the ideal significance in itself and the content which that suggestion purports to express, in other words the external appearance[22]. It furnishes consequently the fundamental type to that specific art, whose

function it is to elaborate the objective world as such, Nature's environment in the beautiful conclusion given by Art to Spirit (mind), and to image by suggestion the ideal significance of what is spiritual in this external medium. The classical Ideal, on the contrary, meets the case of the presentation of the Absolute as such, in its self-subsistent external reality, its essential self-repose, while the romantic Spirit (mind) type of art is, both in content and form, identical with the internal life of the soul, and the emotional life both in its infinite aspect and its finite particularity.

It is, then, on a principle such as the above that the system of the particular arts is differentiated as follows:

First, we have *architecture*, the beginning of all, whose foundation reposes in the very nature of its subject-matter. It is the commencement of art for this reason, that art at the start has in general terms neither discovered for the presentation of its spiritual content the adequate material, nor the forms that fully express it, and is consequently compelled to rest content in the mere *search* after such true satisfaction, and to do so in the externality of its content and its mode of presentation. The medium of this primary art is that which is essentially unspiritual, gross matter, that is, only capable of configuration according to physical laws of gravity. Its form is the image of external Nature, united by its regularity and symmetry in the whole of a work of art to express merely an external reflection of Spirit.

The *second* art is *sculpture*. Both for its principle and content it possesses spiritual individuality under the mode of the classic Ideal in the sense, namely, that the ideal and spiritual finds its expression in the corporeal appearance pertinent to spiritual life, which it is the function here of Art to present in existent artistic actuality. It consequently still accepts for its material gross matter in its spatial extension, without, however, shaping the same in conformity to rule merely in respect to its gravity and its natural conditions according to the forms of the organic or inorganic, or

in relation to its visibility in bringing it down to, and in all essential respects particularizing it in, a simple repetition of the external appearance. The *form* which is here, however, determined by virtue of the content itself is the actual life of Spirit, human form, and its objective organism permeated with Spirit's own breath, whose function it is to embody in adequate shape the self-subsistence of the Divine in its supreme repose and unperturbed greatness, unaffected by the divisions and limitations of human affairs, their conflicts and endurances.

Thirdly, we have to render intelligible in one final whole those arts whose province it is to give form to the ideal content of the individual soul-life.

The art of *painting* marks the *beginning* of this final totality. It converts the external form itself entirely into an expression of what is ideal[23], which within the limits of the environing world not merely reproduces the ideal self-containedness of the Absolute, but also brings to the vision the same as essentially a personal possession[24] in its spiritual existence, volition, feeling, action, in its activity and relation to another, and consequently also in its sufferings, pain, death, in the entire series of passions and satisfaction. Its object is for this reason no longer *God* simply, that is, as object of the human consciousness, but this consciousness itself, God, that is, either in His reality present in the action and suffering of individual life, or as spirit of the community, as the spiritual related through feeling to itself, soul-life in its resignation, its sacrifice of, or joy and blessedness in, life and action within the limits of the natural world. As a means to the presentation of this *content* the art of painting is bound to utilize the external phenomenon in respect to its form, not merely the human organism, but also Nature in its simplicity in so far as the same suffers what is of spirit to shine through with clarity. It is, however, unable to utilize as material physical matter and its spatial existence just as it is; it is compelled, in working it up into its

forms, essentially to idealize the same. The first step by means of which the sensuous material is raised in this respect to confront mind[25], consists, on the one hand, in the uplifting of the actual sensuous appearance, whose visibility is converted into the mere *show* by art, and on the other in *colour* by means of the distinctions, transitions, and modulations of which this transformation is effected. The art of painting, consequently, in order to express the soul in its ideality, resolves the three dimensions of space into that of superficies as that which most intimately asserts the ideality of what is external, and represents spatial distance and form by means of the phenomena of colour. For painting is not concerned with producing mere visibility in its general significance, but with that form of visibility which, if it is ideally produced, is also quite as much essentially particularized. In sculpture and the art of building forms are visible by means of external light. In the art of painting, on the contrary, the material which is itself essentially obscure possesses intrinsically within itself its inward or ideal, light in short. It is itself transfused in its own medium, and mere light is to that extent essentially obscured. The unity, however, and blending of light and dark is colour[26].

Secondly, the art of *music* offers a contrast to that of painting in one and the same sphere as the latter. Its real element is the ideal realm as such, emotion in its formless independence, capable of asserting itself not in externality and its reality, but purely through the external medium which disappears immediately when it is expressed and thereby cancels itself. Its *content* consequently consists of the internal life of Spirit in its immediate, essential subjective unity, emotion simply; its *material* is musical tone, its form and configuration, the concord, discord, harmony, contrast, opposition, and resolution of such tones according to the laws of their quantitative intervals respectively and their artistically elaborated time measure.

Finally, in the *third* place, after painting and music we get the art of speech, *poetry* in its general terms, the absolutely genuine art of Spirit and its expression as such. For everything which the human consciousness conceives and spiritually embodies in the chamber of spirit speech is able to accept, express, and bring imaginatively before us, and only speech is thus able. In respect to its content, therefore, poetry is the richest and its boundaries are the widest. But in proportion as it gains as the vehicle of Spirit it loses on the side of the material object. In other words, for the reason that it neither works for the perception of the sense as the plastic arts, nor merely for the ideal emotion, as music does, but is concerned to create its spiritual significances under the form of its own spiritual medium merely for the conception and contemplation of mind, the *material* through which its constructive activity is asserted only retains for it the value of a *means*, however much it may be elaborated in an artistic sense, by which Spirit is expressed for Spirit, and no longer counts as a sensuous mode of existence, in which the spiritual content is capable of finding a reality adequate to it. Such a means can in the light of our previous consideration only be *tone* regarded as the still relatively most adequate material of spiritual expression. Tone here, however, does not in the present case preserve, as was the case with music, an independent validity of its own for which the unique and essential aim of art could be exhausted in finding an artistic form, but conversely is entirely steeped in the world of Spirit and the definite content of conception and contemplation, and appears simply as the external symbol of this content. So far as the *embodiment* which the poetry receives is concerned, in this respect poetry may claim to include the whole field of art in the sense, that is, that it repeats in its own province the modes of presentation adopted by the other arts, which is only in a qualified degree the case with painting and music.

In other words poetry gives, on the one hand, as epic poetry the form of *objectivity* to its content, which no doubt here does not, as in the plastic arts, attain to an external existence. It is none the less a world conceived by the mind in the form of the objective world and represented as objective for the individual imagination. This it is which constitutes human speech as such, which finds satisfaction in its own content and its expression by means of speech.

On the other hand, however, poetry is conversely to an equal degree speech of the soul, the *ideal* medium, which, as that inward content returns to itself, is *lyrical poetry*, which invokes the aid of music in order to penetrate yet more deeply the world of souls and emotion.

Finally, to take the *third* example, poetry proceeds through speech within the limits of a self-contained *action*, which it at the same time makes an object of its presentment, and consequently is able to ally itself closely to music, gesture, mimicry, and the dance. This is *dramatic* art, in which man, in all that the term implies[27], creatively presents the work of art which is the product of human life. These five arts form the system of realized and actual art, essentially determined by itself and differentiated as such. In addition to them there are no doubt other incomplete arts, for example, the arts of gardening and dance. These we shall only refer to incidentally as the opportunity recurs. A philosophical investigation must perforce restrict itself entirely to distinctions referable to the notion, and develop and grasp these adequate and veritable modes of embodiment. Nature and reality is not, it is true, confined to these circumscribed limits, but is more liberal in its movement, and we not unfrequently hear it made a matter of praise that in this respect the products of genius are perforce compelled to expand themselves beyond just such limitations. In Nature, however, transitional organisms of either hybrid or amphibian type, instead of emphasizing the spontaneity and excellence of Nature, merely demonstrate its inability to

hold fast to the essential differentiations of species which are rooted in that process, or to prevent their deterioration before external conditions and influences. The same thing may be affirmed in art with regard to these intermediate forms, although the same are capable of producing much, too, that delights us, is full of charm and utility, albeit not in the highest class of perfection.

If we turn our attention now after these introductory remarks and considerations to the more specific examination of the separate arts, we shall find ourselves from another point of view in some difficulty. For inasmuch as we have hitherto concerned ourselves with art as such, the Ideal and the general types, under which its evolution according to its *notion* proceeds, it is imperative to pass over into the concrete existence of art, and by doing so into the world of experience. Here we find a condition very analogous to that we observe in Nature, the provinces of which are readily grasped in their generality and the necessary laws which distinguish them, in whose actual material existence, however, the individual objects and their species, not merely in the aspects which they present to observation, but also in the form under which they exist, are of such a wealth of variety that, as a part of the difficulty, they offer as feasible every conceivable way of approaching them; and in addition to this the philosophical notion, when we are desirous of applying the standard of its simple lines of distinction, appears as insufficient for this purpose and the mere grasp of thought incapable of taking in the breath of such fulness. If, however, we merely rest satisfied with mere description and superficial reflections we fall short no less of the object we have set before us, that is, a development which is both scientific and systematic. Added to which difficulties we have the further one that nowadays every particular art makes the independent demand for a special science, inasmuch as with the continuous growth of connoisseurship in art the range of such special

knowledge has become ever more rich and extensive. This science of the connoisseur, or dilettante, has, however, in our own times become fashionable under the direct teaching of philosophy itself. It has, in short, been maintained that it is in art we must look for real religion, the discovery of truth and the Absolute, that, in short, it stands on a loftier pedestal than philosophy for the reason that it is not abstract, but receives at the same time the Idea in reality and for a contemplation and emotion which are concrete[28]. And on the other hand it is regarded nowadays as of august importance in art[29] to occupy one's attention with an infinite superfluity of detail of this kind, in the interests of which the demand is made from everyone that he should have observed some novelty or other. Such critical labour is a kind of learned trifling which may very readily be overdone. It causes, no doubt, considerable pleasure to examine works of art, to grasp the thoughts and reflections which such may suggest, to give currency to the points of view, which others have pointed out, and by this means to become judges and critics. The more rich, however, by this means, namely, that everybody is intent on having discovered on his own account something uniquely his own, a learning and process of reflection has become, the more every particular art, nay, every branch of the same, now renders necessary the completeness of a treatment of it from the individual's standpoint. As a corollary the historical aspect of such a survey and the criticism of works of art, which becomes inevitable, only add yet further to the learning and range of the subject. It is, moreover, essential before we take part in any discussion over the details of matters of artistic import that we should already have seen much and many times. Personally I have no doubt seen a considerable amount, but by no means all that is necessary to enable me to discuss the material of art exhaustively. All such difficulties, however, we may meet with the simple response that it does not lie within the aim of the present work to teach art-criticism, or to bring forward an

historical review of such learning, or only to the extent such is necessary to apprehend on philosophical principles the essential and universal aspects of our subject, and their relation to the idea of the beautiful in its realization within the sensuous medium of art. If we keep this aim before us the variety of artistic effects we above indicated need cause us no embarrassment; for despite this complexity the essential character of the subject-matter according to its notional idea is the controlling factor; and although this is frequently lost in accidental matter by virtue of the medium in which it is realized, points of view are none the less in evidence, in which it is as clearly proclaimed. To grasp these aspects, and to develop them in a scientific way, is the very problem which it is the function of philosophy to elucidate.

FIRST SUBSECTION

ARCHITECTURE

Art, by enabling its content to attain a realized existence under a definite form, becomes a *particular* art. We may therefore now for the first time refer to it as an actual art and find therein the *real* beginning of art. With this particularity, however, in so far as it purports to bring before us the objectivity of the Idea of the beautiful and art, we have presented to us at the same time in its notional significance a *totality* of what is particular. For this reason when we now, in the sphere of the specific arts, begin our examination of the same with the art of building this must not merely be accepted in the sense that architecture asserts itself as the art which, by virtue of its notional definition, is first presented to us as such an object of inquiry, but we may equally accept as a result, that it is also in relation to its *existence* the art first to be considered. In supplying, however, an answer to

the question, what the mode of origin was, which fine art, relatively to its notion and realized form, has received, we must exclude the experience of history no less than reflections, conjectures, and ordinary conceptions, which merely have reference to objective history, and are so readily and in such variety propounded. In other words, men are ordinarily actuated by an impulse, to bring before their mental vision anything in its original mode of appearance for the reason that the beginning is the simplest mode, under which the fact asserts itself. And connected with this impulse we have present behind it the covert conviction that the simple mode of appearance informs us of the fact in its notional significance and real origin, and the further amplification of such a beginning to the actual point in the process which only really concerns us is further with a like readiness conceived under the trivial mode of thought, that a process so understood has *gradually* brought art forward to the crucial stage above indicated. A beginning, however, of this simplicity is, if we look at its content, something which, taken by itself, is so unimportant, that for philosophical thought it can only appear as wholly accidental, albeit it is for the ordinary consciousness only just in such a way that the origin can be readily grasped. For example, we have the story, as an explanation of the origin of the art of painting, told us of a maiden who followed the dim outline of the shadow of her sleeping lover. In the same way we have sometimes a cave and sometimes a hollow tree adduced as the point of departure in the art of building. Beginnings of this kind are so intelligible in themselves that further comment on the fact appears unnecessary[30]. In particular the Greeks invented many charming tales to explain the origins not merely of fine art, but also ethical institutions and other conditions of life, all of which satisfied the primary need to make such beginnings visible to the *imagination.* Such beginnings are not substantiated by history, and yet they do not aim at making the manner of origin intelligible directly as a process

involved in the *notion*, but purport to confine their explanation to the field of objective history.

DIVISION OF SUBJECT

We have, then, in such a way to establish the beginning of art from its notional significance, that the first problem of art is made to consist in giving form to that which is essentially objective, the ground, that is, of Nature, the external environment, and by doing so to make that which is without ideal import to conform both to significance and form, both of which still remain external to it, for the reason that they are not either the form or significance inherent in the objective material. The art, which has set before it this task is, as we have seen, an architecture which has already discovered its first elaboration under the modes of sculpture, or painting and music[31].

If we now direct our attention to the most primitive origins of the art of building, we find at the earliest stage that we can accept for such a beginning the hut, regarded as the human dwelling, and the temple, as the exterior enclosure of the god and his community. With a view to define this commencement more closely a dispute has been raised with reference to the nature of the *material* employed for building, whether, that is to say, it originated in buildings of wood, which is the opinion of Vitruvius, and is supported by Hirt in a similar reference, or rather from those of stone. This contrast of original material is no doubt of importance, for it does not merely concern its external quality as one might at first sight suppose, but rather the architectonic character of fundamental forms; for instance, the kind of decoration united with it is essentially bound up with this external material. We may, however, entirely set aside the distinction as a purely subordinate aspect of the matter rather referable to what is accidental and empirical, and devote our attention to a point of more importance.

In other words, in dealing with houses, temples, and other buildings we are confronted with the essential condition, to which we attribute the fact that buildings of this kind are merely *means* which presuppose an external end. Hut and house of God alike presuppose those who dwell in them, and for whom they have been erected, men and the images of gods. Man is also prompted by a desire to leap and sing; he requires the mediacy of human speech; but speech, leaping, shouting, and singing are not as yet poetry, the dance and music. And when within the architectonic adaptation of means to ends in order to satisfy specific needs, in part referable to daily life and in part to the religious cultus or the state, the impulse in the direction of artistic form and beauty asserts itself, we find at the same time a *division* apparent in the kind of building above mentioned. On the one hand we have man, thinking man, or the image of the god as the essential *object*, for which, from the other point of view, architecture merely supplies the *means* of environment and covering. With such a divided point of view we are unable to constitute our beginning, which is in its nature the *immediate*, and simple, not a relativity or essential relation of this sort; rather we must look for a point of departure, where a distinction of this kind does not yet arise.

In this respect we have already at an earlier stage stated that the art of building corresponds to the *symbolic* type of art, and in a unique degree gives realization to the principle of the same as particular art because architecture generally is adapted to suggest the significances implanted in it purely in the external framework of the environment. If the distinction, then, above referred to between the object of the external cover independently presented in the living man, or the temple's image, and the building regarded as the fulfilment of such an object, is to be absent from our earliest stage, we shall have to look about us for buildings which precisely, as works of sculpture, do stand up in *independent* self-subsistence, which in short carry their significance in *themselves* rather than

in some *other* object or necessity. This is a point of the highest importance, which I have never found raised hitherto, although it goes to the root of the matter, and alone is capable of disclosing the manifold nature of external forms, and of supplying a thread to conduct us through the maze of architectonic configuration. A self-subsistent art of building of this kind will also to a similar degree differ from sculpture on this ground, namely, that it, as architecture, does not create images, whose significance is that which is essentially spiritual and personal, and which itself intrinsically possesses the principle of an appropriated embodiment throughout adequate to its ideal import, but builds up works which, in their exterior form, can merely give an impress of the significance in a symbolic way. And for this reason this type of architecture, both in respect to its content and, its presentation, is really of a *symbolic type.*

All that we have said with reference to the principle of this stage of art applies equally to its mode of *presentation.* Here, too, we find that the mere distinction between buildings of wood and stone is not sufficient, in so far as the same points to a means of limiting and enclosing a defined space for a specific religious or other human purposes, as is the case with dwellings, palaces, and temples. Such a space, may be obtained either by hollowing out essentially solid and stable masses, or conversely, by preparing walls and roofs to enclose it. We can make our beginning of the art of building with neither of these alternatives, which we should consequently define as an inorganic form of sculpture; such a type no doubt piles up independently stable images, but while doing so does not in any way make the end of free beauty and the manifestation of Spirit in the bodily form commensurate with the end it pursues, but in general terms sets up a purely symbolic form, which purports in itself to indicate and express a particular idea.

Architecture is, however, unable to remain standing at such a point of departure. Its function indeed consists just in this, namely, to build up

external Nature as an environment which emanates from Spirit itself through the gates of art under the forms of beauty, and to build it for the independently present life of mind, that is mankind, or for the images of the gods that are set up and clothed by man in objective form, and to build up the same as that which no longer carries its significance in itself, but discovers the same in another, that is man, and his necessities and objects of family and State-life, culture and so forth, and by so doing surrenders the self-subsistency of such buildings.

Regarded under this aspect we may assume the *advance* of architecture to consist in this, that it suffers the above indicated distinction between end and means to appear in separation, and constructs for man, or the individual human form of gods, which is the work of sculpture, an architectural dwelling, palace, or temple analogous to the significance of the same.

And, thirdly, the *termination*[32] unites both phases in the process, and appears within this aspect of division as at the same time self-subsistent. These points of view present to us, as the classification of the entire art of building, the following heads of division, which essentially comprehend the notional distinctions of the matter in question no less than the historical development of the same.

First, we have the genuine *symbolic* or *self-subsistent* type of architecture.

Secondly, there is the *classical* type, which gives independent form to spiritual individuality, divesting on the other hand the art of building of its self-subsistency, and degrading it in the intent to set up an inorganic environment under the forms of art, for the spiritual significances which are now on their part independently realized.

Thirdly, *romantic* architecture, in other words the so-called Moorish, Gothic, and German, in which, it is true, houses, churches, and palaces are

also merely the dwellings and places in which civic and religious needs and activities are concentrated; which, however, conversely are also shaped and raised without let or hindrance for the express object of emphasizing their self-subsistency.

Although on the grounds already advanced architecture in respect to its fundamental character remains of a symbolic type, yet the artistic types known as the truly symbolic, classical, and romantic constitute the closest means of defining it, and are here of greater importance than in the other arts. For in sculpture the classical, and in music and painting the romantic, penetrates so profoundly to the entire root-basis of these arts respectively, that for the elaboration of the type of the other arts[33], to a more or less degree, but little room is left for other aspects. And, finally, in poetry, though it is the fact that it gives the most complete impress in its art-products of the entire series of art-types, we shall find it necessary to make our classification not by means of the distinction between symbolic, classic, and romantic poetry, but according to the specific differentiation applicable to poetry as a particular art in epic, lyrical, and dramatic poetry. Architecture is, on the other hand, art in its immediate relation to the external medium, so that in this case the essential differences consist in this, whether this external matter receives its significance intrinsically, or is treated as a means for an object other than it, or finally asserts itself in this subservience as at the same time independent. The first case is identical with the symbolic type simply, the second with the classical, the real significance attaining here an independent presentation, and in doing this the symbolic is attached as an environment wholly external to it, a type which is exemplified in the principle of classical art. The union of these two types is coincident with the romantic, in so far, that is, as romantic art makes use of the exterior medium as a means of expression, yet withdraws itself into itself out of this reality, and is consequently able once more by

doing so to let objective existence stand forth in self-subsistent embodiment.

[1] *Gediegene* here seems to mean that the unity is a real one throughout all its manifestations — it is one of sterling efficacy.

[2] By the words *die innere Produktion der Kunst* is meant apparently "the creative activity of art-production as ideally conceived in a series of general world-impressions (*Weltanschauungen*)." The main contrast between the theoretic apprehension of such an evolution of art as a series, held in its broad generic outlines by mind, and its practical realization as differentiated in the *actual* products of different arts is sufficiently clear. The difficulty remains, however, as to how far Hegel regarded these *Weltanschauungen* in their universality to have themselves an *objective* significance no less than a *subjective* one — how far, in other words, are they merely abstract concepts of the observer, the schemata of scientific generalization, or do actually unfold an objective, if ideal process — how far is the thought one with the revelation of the Absolute itself. It is, of course, a difficulty not unknown to the student of Hegel in other directions. At least, as translator, I must content myself, as an excuse for obscurity in this and other passages, with drawing attention (*a*) To the main contrast which is quite clear, and (*b*) To the fundamental difficulty which remains. As a rule the word *Weltanschauung* is generally used rather in the sense of a world-outlook as from the point of view of an observer. In this passage, and still more obviously a little lower down, the sense appears to be rather world-presentment or manifestation — and the emphasis certainly on the objective aspect. Thus the Ideal of Beauty is defined as "the collective totality of its *Weltanschauungen.*" How far within such, which have previously been called exclusively *ideal* (*innere*) can be incorporated the positive concrete embodiments of definite works of art is for myself the difficulty, which I do not profess myself to be able to solve. I am in fact not entirely clear as to the entire meaning of Hegel myself. The mere statement that the one is made objective by the other does not appear to me to remove the difficulty; for, to mention no other objection, a particular work of art is not exclusively either concrete or objective in the sense that an ideal process is so, or an Ideal which combines the ideal stages or moments in such a process.

[3] *Welche sich objectivirt.* See note above.

[4] The present, that is, which is objective to sense.

[5] *So löst sich das Ideal in seine Momente auf.* According to this it would appear that the process is wholly identified with the system of the particular arts. But the universal world-presentments are

surely equally a process or at least an abstract of such a process. And this is in fact affirmed lower down.

[6] A favourite metaphor of Hegel. The idea is that the metal is all one infusion producing a result that is like the appearance of Athene from the brow of Zeus.

[7] *Der Subjektivität.* The mind of the artist.

[8] A misprint. *Der* should be *die.*

[9] *Zuversicht.* Confidence in itself.

[10] *Die Sache.* The fact, the artistic object primarily treated.

[11] *Die Subjektivität.* What is personal in the perception of judgment.

[12] A fine illustration of this passage is to be found in Miss Harrison's description of the Praxiteles Hermes in her admirable "Introductory Studies in Greek Art" (see chap, VI), a work every student of Greek Art should peruse.

[13] *Gediegenheit.* Sterling solidity. To understand all that is implied the above cited work of Miss Harrison is the clearest and most useful I know.

[14] *In Unterhaltung.* Finds himself, so to speak, directly conversing with him.

[15] *Der Gattungen, i.e.*, specific types.

[16] *Das Aussereinander.* A differentiated exteriority.

[17] *Subjektivität*, the ideal unity that is — not so much as soul or personality.

[18] *Kein subjektives Inneres.* No ideal content that implies a unifying subject.

[19] Same expression as last note. An ideal realm in its aspect of relation to an individual soul.

[20] *Als Element.*

[21] Or reason (*Geist.*)

[22] As such content.

[23] This must be taken subject to qualifications which appear further on.

[24] *An sich selbst subjektiv.* As essentially appertinent to the individual soul.

[25] *Sich entgegenheit dem Geist*, *i.e.*, raises itself as a medium opposed to — or, as we should say, subservient to.

[26] This is obviously a reference to the false theory of light advanced by Goethe and accepted by Hegel.

[27] *Das ganze Mensch.* The entire man with all his faculties.

[28] This is a reference, of course, to the Art Philosophy of Schelling.

[29] *Zum vornehmen Wesen.* Ironical, of course. It is part of the aristocratic pretensions of the connoisseur.

[30] He means that as an explanation they are obvious provided the facts are true, which he then points out in such cases is not so.

[31] I am not sure I follow the sense here. I presume the meaning is that, as *notionally* considered, we have to commence with an architecture to which other arts are already subservient. The process of elaboration has already been carried beyond mere architecture. And in this sense he calls sculpture an elaboration (*Ausbildung*) of architecture. But the addition of painting and music as such elaboration is, to say the least, an unnecessary obscurity. Such an elaboration of a primitive form of music is suggested lower down. But the conception appears to me rather confusing.

[32] That is the final phase, romantic architecture.

[33] Other than architecture.

CHAPTER I

INDEPENDENT SYMBOLICAL ARCHITECTURE

THE PRIMARY AND original necessity of art is this, that a conception, a thought emanate from mind, be produced and emphasized by man as the result of his activity, just as in speech there are simple ideas which man communicates thereby and makes intelligible to others. In human speech, however, the means of communication is accepted merely as a sign, and for this reason is an entirely arbitrary mode of externalization. The function of art, on the contrary, is not only to make use of the mere symbolic sign, but, in contrast to this, to supply a sensuous presence correspondent to significances. On the one hand, therefore, the sensuous product, which art presents to us, must afford lodging for an ideal content; on the other it has to represent this content in a manner which enables us to see that it is itself as its content not merely a realization of immediate reality, but an actual product of human conception and its spiritual activity. If I see, for example, an actually living lion I deduce from the unique presentment of the same the concept of lion precisely as I should in the case of a picture of it. In the picture, however, we find something more than this. It demonstrates to us that the form has been conceived in the mind, and has found the origination of its existence in the human spirit and its productive activity, so that now we not only receive the idea of an object, but the idea of a human conception of that object. There is, however, no original artistic necessity that either a lion, merely as such[34], a tree, or any other single object be added for the success of such reproduction. We have seen, on the contrary, that art, and pre-eminently plastic art, proceeds with the presentation of such objects in order to affirm in them the dexterity of the counterfeit from

the artist's own point of view. The interest in its first origination is directed to bringing before the vision of the artist himself and others the primary impressions of the objective facts, and the universal or essential thoughts thus stimulated. Such popular impressions are, however, in the first instance abstract and in themselves of indefinite character, so that man, in order that he may present them to the imagination, lays hold of that which is essentially just as abstract, the material medium as it is — which is at once massive and ponderous — a material which is no doubt capable of a definite, but not of an intrinsically concrete and veritably spiritual, content. The relation between content and sensuous reality, by virtue of which the content is to pass from the concipient world into that of imagination, can consequently only be of a symbolical type. At the same time, however, a building, which purports to declare a general significance for others, stands there for no other purpose save that of essentially expressing this loftier aspect, and is consequently an independent symbol of a thought that goes straight to its essential import, and is of universal validity, a kind of speech which is present to spiritual life on its own account, however much it may not be expressed through sound. The products, therefore, of this type of architecture are necessarily stimulating to thought of themselves, and arouse universal concepts, albeit they fail to be the mere envelope and environment of significances which otherwise possess independent form. For this reason, however, the form which permits a content of this kind to appear through it cannot perforce merely pass as symbolic sign, as, for example, in the case when we raise a cross to a deceased person, or erect stones in memory of battles. For signs of this character are doubtless qualified to stimulate ideas, but a cross, or a pile of stones, do not suggest, in virtue of their own nature, the idea which it is our object to awake, but are just as able to remind us of much else entirely different. This distinction constitutes the general notion of the stage now discussed[35].

With regard to this it may be affirmed that entire nations have known how to express their profoundest requirements in no other way than by the arts of building, or at least pre-eminently in an architectonic way. This has been, however, to an essential degree only in the East, as will appear from what we have already seen when we were called on to discuss the symbolic type of art. To an exceptional degree we may say that the constructions of the more ancient art of Babylonia, India, and Egypt — which we have now before us to some extent only in ruins, ruins which have been able to defy all ages and their revolutions, and which excite our wonder and astonishment as much on account of what is wholly fantastic in their forms as in virtue of their extraordinary proportions and mass — either completely bear this character, or in great measure are derived from it. They are works whose construction enlists at certain periods of history the entire activity and life of nations.

If, however, we inquire more closely into the *classification* proposed by this chapter and the heads of subject-matter comprised in it, we shall find that the point of departure in this kind of architecture is not, as in the case of the classic or romantic type, from definite forms similar to that of the house. In other words we have here no independently secure content, and with it no secure mode of embodiment, advanced as the principle thereof, which is forthwith related in its further development to the entire range of the different constructions. Rather the significances which are accepted as content remain, as in the case of the symbolic type generally, likewise inchoate and general conceptions, elementary, in many respects separated and interfused abstractions of natural life mingled with thoughts of spiritual activity, without being, ideally concentrated to a focus as the evolved states of *one* mind[36]. This aspect of dissolution gives them the appearance of the greatest variety and change, and the object of such architecture merely consists in emphasizing in its presentation first one aspect and then another,

in making such symbolical, and, by means of human labour, making such symbolism apparent to us. Before a multiplicity of content such as this we cannot pretend in this discussion to be either exhaustive or systematic. I shall limit myself to an attempt, so far as this is possible, to bring simply that which is of most importance into connection with a rational classification.

The prominent features of such a survey may be thus briefly enumerated.

As content our demand was for modes of view of a wholly general character, in which peoples and individuals possess an ideal resting-place, a point, a unity for consciousness. The *proximate* object, therefore, of such independent and self-substantive construction is simply to raise some work, which forms the *unity* of a nation or nations, a place in which its life may be concentrated. We may also find along with this the further object more nearly associated, to present by means of this very embodiment, that which generally unites mankind, in other words the religious ideas of nations, by virtue of which works of this kind receive likewise a more definite content for their symbolical expression.

Furthermore, in the *second* place, such an architecture is unable to remain fixed within the limits of this incipient determination of its *entire* content; the symbolical images tend to become *isolated*; the symbolical content of their signification is more closely defined, and by this means we find that the distinctions of their forms tend to come into more assured prominence, as for instance we see in the case of the Lingam columns, obelisks, and other examples of this kind. From another point of view the art of building, in the spirit of such isolated self-subsistency, presses forward in its passage to *sculpture*, its acceptance of organic animal forms or human figures, its enlargement of either and association of both of them, however, on a prodigious scale, in its further addition of walls, doors and passages, and throughout in its treatment of what is adapted to sculpture in

such objects in an entirely architectonic manner. The Sphinxes, Memnons, and enormous temples of Egypt come under this category.

Thirdly, this symbolical art of building begins to present the transitional stage to the classic type. In other words it excludes sculpture from its immediate province, and sets about constructing itself as a receptacle for other significances, which are themselves not merely expressed under an architectonic mode. That the reader may better understand the process thus indicated I will recall to memory a few famous examples of such buildings.

1. ARCHITECTURAL WORKS ERECTED WITH THE OBJECT OF UNITING PEOPLES

"What is holy?" is a question raised by Goethe in a certain distich, and the answer he gives is: "that which binds together many souls." In this sense we may affirm that what is sacred, together with the end expressed in the above association, and as such association, has actually formed the primary content of self-subsistent building and the art of such. The earliest example of this we may take from the story of the building of the tower of Babylon. In the broad expanse of the Euphrates valley we are told that mankind erected an enormous architectural work. It is built by the labour of a community, and this public character of its construction is at the same time the end and content of the work itself. And what is equally true is this, that this foundation of an association of communal labour is no mere unity of a patriarchal stamp; on the contrary we find here that the mere unity of the family is precisely that which is set on one side, and this building, which is raised to the heavens, is the objective presentment of the dissolution of the more primitive type of unity and the realization of another of more expansive range. The collective activity of peoples belonging to that age worked in it; and, in proportion as they came together in order to

accomplish a building of prodigious size, the product of their activity came to be the band, which, on the ground and soil they had thus selected, and by means of the accumulated mass of stone and the architectural construction on the land — just as in our case morality, custom, and the lawful constitution of State-life — bound them in unity together. A building of this kind is in consequence also symbolical for the reason that it merely suggests the band of unity which it is, because it is only able, by means of its form and content, to express the sacred unity which unites men in an external way. It is also equally a part of this tradition that the communities have once more split apart from the centre of attraction which united them on a work of this external character.

A further and yet more important building, which has, too, already a more reliable historical basis, is the temple of Belus, of which Herodotus informs us[37]. We will not here inquire in what relation this stands to that of Biblical tradition. It is impossible to call this structure, taking it as a whole, a temple in any ordinary meaning of that term; rather we should call it a temple enclosure in the form of a square, each side of which was two stadia long, with brazen gates for means of entry. In the centre of this sacred place, according to Herodotus, who had actually seen this colossal work, a tower of thick walls (with no interior, solid throughout, in other words a πέργος στερεός) was built, both in length and breadth a stadium: on this was placed yet another, and again another on that, and so on, eight towers in all. On the outside of this a roadway was made to the top; and it appears that halfway up to the summit was a place of rest with benches on which all who ascended could rest themselves. On the summit, however, of the last tower there was a huge temple, and in the temple was a great bench, well cushioned, and before it stood a gold table. No statue, however, was placed in the temple. No one was permitted to be there at night with the exception of the attendant women, who, according to the statements of the

Chaldaeans, the priests of this god, were selected by him pre-eminently for service. The priests further maintained (*c.* 182) that the temple was visited by the god, who rested on the bench made for him. Herodotus, it is true, also states (*c.* 183) that below within this sanctuary there was yet another temple, in which was placed a great image of the god of gold, together with a huge golden table before it, and at the same time refers to two great altars outside the temple on which the sacrifices were made. Notwithstanding these facts it is impossible to picture this gigantic building as a temple either in the Greek or modern sense of the term. For the first seven cubic towers are solid throughout, and it is only the eighth one at the summit which serves as a resting-chamber for the invisible god, who received therein no obeisance either from priesthood or the community. His image was below outside the building, so that the entire construction was raised in really independent and self-contained form, and did not subserve the objects of religious ritual, although it is no longer a purely abstract point of unity that we find here but a sanctuary. The form remains no doubt subject to accidental causes, or it receives its determinate character purely on account of the material security of the cube form; at the same time we have evidence of a demand which seeks for a significance which may supply a determinate relation to it more directly symbolical and applicable to the work taken as a whole. We must look for this, though this is not a point expressly adverted to by Herodotus, in the number of the massive floors. There are seven of them with an eighth superposed for the nightly abode of the god. This number of seven in all probability symbolizes the seven planets and spheres of heaven.

We find also in Media cities built in accordance with such a symbolism. There is, for example, Ecbatana with its seven encircling walls, of which Herodotus[38] states that in part by virtue of the height of the elevation on the slope of which the city was built, and in part intentionally and by artificial

means, they were higher one than the other, and their battlements were coloured differently. White was on the first, black on the second, purple on the third, blue on the fourth, red on the fifth; the sixth, however, was coated with silver, and the seventh with gold, and within this last stood the royal stronghold and its treasure. “Ecbatana,” remarks Creuzer, in his work on Symbolism, when referring to this type of building[39], “that Median city, and its royal stronghold in the centre, with its seven circles of walls and its battlements of seven different colours, represents the spheres of heaven which enclose the stronghold of the sun.”

2. ARCHITECTURAL WORKS INTERMEDIATE BETWEEN THE ARTS OF BUILDING AND SCULPTURE

The first point we have to consider in the further development of our subject consists in this, that architecture accepts for its content significances that are more *concrete*, and aims at their more symbolical presentation in accordance with *forms* that are similarly *more concrete*, which, however, whether we take the case of their insulation[40], or collective accretion in gigantic buildings, they do not make use of in the way sculpture makes use of them, but architectonically in their own independent province. In the case of this present type we have to direct our attention to more specific facts, although all that we advance can put in no pretension to completeness, or an *a priori* development for the reason that art in so far as it proceeds in its products to embrace the full range of the actual, that is the historical ways of comprehending the world and its religious conceptions, is lost in aspects of a contingent character. The fundamental definition of the type is simply this, that we have a confused blend of sculpture and architecture, albeit the art of building is that which permeates all and predominates.

(*a*) We had occasion before, when discussing the symbolic type of art, to mention the fact that in the East it is frequently the universal living force of

Nature, that is, not the spirituality and might of consciousness, but the productive energy of generation, which is emphasized and revered. More particularly in India this religious attitude was universal; also from its sources in Phrygia and Syria under the image of the great goddess, the fructifyer, a conception was derived which the Greeks themselves accepted. Still more closely considered this conception of the universally productive energy of Nature was represented and held sacred in the form of the organs of sex, Phallus and Lingam. This cultus was in the main promulgated in India, albeit also, as we learn from Herodotus, it was not wholly foreign to Egypt. At any rate we meet with something of the kind in the festivals of Dionysus. According to the statement of Herodotus, “they have invented other puppets as substitutes for the phalli of an ell’s length, which the women draw about with a string, on which we find the sexual member no smaller in size than the rest of the body.” The Greeks accepted a similar ministration, and Herodotus expressly informs us (*c.* 49) that Melampus had knowledge of the Egyptian sacrificial festival of Dionysus, and had introduced the phallus which was carried about in honour of the god. It was in India especially that the worship of the energy of generation assumed the exterior shape and significance of the organs of sex. Enormous columnar images were in this respect raised of stone as massive as towers and broadening out at the base. Originally they were themselves independently the aim and objects of such worship; only at a later time it became customary to make openings and hollow chambers within them and deposit in these divine images, a custom which was maintained in the Hermes figures of the Greeks, little temple shrines that could be carried. The point of departure, however, in India was the phallus pillars, which had no such hollows, and which only at a later date were divided into a shell and kernel, growing thus into pagodas. For the genuine Indian pagodas, which should be distinguished essentially from later Mohammedan or other imitations, do

not originate in the form of the dwelling, but are narrow and lofty, and receive their fundamental type from these columnar constructions. We find a similar significance and form also once more in the conception of the mountain Meru as expanded by Hindoo imagination, which is conceived as twirling stick in the sea of milk, and is the creative source of the world. Herodotus mentions similar columns, some constructed in the shape of the male, others in that of the female organ. He ascribes their construction[41] to Sesostris, who erected them everywhere on his military expeditions against all the peoples he conquered. The majority of such pillars no longer existed in the days of Herodotus. It was only in Syria that the historian[42] had himself seen them. However, the fact that he ascribes them all to Sesostris is merely based on the tradition he adopts. Moreover, his explanation is wholly Greek in its colour; he converts the natural significance into one of ethical import and in this sense informs us: "In cases where Sesostris during his expedition crossed nations which were brave in battle, he set up pillars in their land together with inscriptions, which gave his own name and nation, and indicated that he had subdued these peoples. Where, on the contrary, he overcame without opposition, he indicated on such pillars the female organ of sex without attaching an inscription in order to declare the fact that these nations had been cowards in battle."

(*b*) We find further constructions of a similar nature, intermediate, that is, between sculpture and architecture, principally in Egypt. With these we may include, for example, the *obelisks*, which do not, it is true, borrow their form from the living organisms of Nature, such as plants, animals, or the human form, but are of a form wholly subject to geometrical rule, yet at the same time no longer constructed expressly as subservient to the human dwelling or temple, but are erected in free and independent self-subsistency, and possess the symbolical significance of the solar rays. "Mithras," maintains Creuzer, "the Mede or Persian, rules in the solar city of Egypt[43],

and is there prompted by a dream to build obelisks, that is to say solar rays in stone, and to inscribe on them letters which are known as Egyptian." Pliny had already attached this import to obelisks[44]. They were dedicated to the sun's divinity, whose rays they were intended to catch and at the same time to reflect. Also we find that in the images set up in Persia we have rays of fire which ascend from columns[45].

After obelisks we should mention as most important the sculptured *Memnons*. The huge statues of Memnon of Thebes, of which Strabo was still able to see one fully preserved and made from a single stone, while the other, which uttered a sound at setting of the sun, was already in his day mutilated, possessed the human form. They were two seated colossal human figures in their grandiose and massive proportions rather inorganically and architectonically designed than in the strict sense sculptured, as also appears in the case of the linear arrangement of the Memnon columns, and, inasmuch as they are only valid in such equable order and size, they wholly digress from the aim of sculpture and are subject to the art of building. Hirt[46] refers the colossal melodious statue, which Pausanias states the Egyptians regarded as the image of Phamenoph, not so much to deity as to a king, who possessed in it his monument, as Osymandyas and others in a similar way. It is, however, quite possible that these imposing images supplied a more definite or indefinite conception of something universal. Both Egyptians and Aethiopians worshipped Memnon, the son of the Dawn, and sacrificed to him on the first appearance of the solar rays by means of which the image greeted with its vocal sound the worshippers. Producing as it did vocal sound it is not merely in virtue of its form of importance and interest, but by reason of its nature as a living, significant and revealing thing, albeit the mode of revelation is purely one of symbolic suggestion.

This relation we have pointed out in the case of these statues of Memnon is equally true in that of the *Sphinxes*, which we have already discussed in

our reference to their symbolic significance. We find these Sphinxes in Egypt not merely in extraordinary numbers but also of stupendous size. One of the most famous of them is the one which is situated in close proximity to the Cairo group of pyramids. Its length is 148 metres, its height from the claws to the head is 65 metres; the feet that repose in front, measured from the breast to the points of the claws, are 57 metres, and the height of the claws 8 metres. This enormous mass of rock, however, has not in the first instance been excavated and then carried to the place now occupied by it. On the contrary, the excavations which have been made to its foundations prove that the foundation consists of limestone, and in a manner which showed that the entire huge work was hewn from one rock of which it only forms a portion. This enormous image more nearly approaches, it is true, genuine sculpture in its colossal proportions; it is, however, equally true that the Sphinxes were also set side by side linearly in passages, in which position they, too, receive a wholly architectonic character.

(*c*) Such independent figures are, as a rule, not only to be found in isolation, but are supplemented by the construction of large buildings resembling the temple type, labyrinths, subterranean excavations of every kind, or amongst other things are utilized in masses and surrounded by walls.

The first thing we may remark with regard to the temple enclosures of Egypt is this that the fundamental character of this huge type of architecture, detailed information as to which we have latterly received in the main from French writers, consists in this that they are constructions open to the day, without roofing, doors, passages between partitions[47], and above all, between columned halls, entire forests of columns. They are works, in short, of the greatest range and variety of interior construction which, without serving as the habitation of a god, or a communion of worshippers, independently by this self-consistent operation appeal to the

wonder of our imaginations quite as much in the colossal size of their proportions and masses, as through the fact that their isolated forms and images make an independent and exclusive claim to our interest. Such forms and images are in truth placed there as symbols for significances which are strictly universal in their import, or in the position they occupy as representing literature, in so far, that is, as they declare such significances not through the manner of their form, but by means of writings, works of imaginative form which are engraved on their surfaces. We may in part describe these gigantic buildings as a collection of sculptured images; for the most part, however, these appear in such a number and with such repetition of one and the same form, that the arrangement becomes one of a series, and it is only in this kind of line and order that they receive what is precisely their architectonic definition, which becomes, however, once more an object in itself, and does not merely mean beams and roofing and nothing beyond them.

The larger constructions of this type start with a paved passage, one hundred feet broad, according to Strabo's statement, and three or four times as long. On either side of this approach (δρόμος) stand Sphinxes, in rows of fifty to a hundred, in height from twenty to thirty feet. After this comes an imposing and splendid portal (πρόπυλον), narrower at the top than at the base, with piers and columns of enormous bulk, ten or twenty times higher than the height of a man; partially isolate and independent, and in part fixed in walls and gorgeously decorated structures[48], which also stand up perpendicularly in independence to the height of from fifty to sixty feet, broader at the bottom than at the top, without being connected with transverse walls, or carrying entablatures[49], and so constituting a dwelling. On the contrary, what we find is that, in contrast to vertical walls, which rather suggest they are built to support a weight, they belong to the independent mode of architecture. Here and there Memnon images lean

against these walls, which also constitute passages, and are entirely covered with hieroglyphics and enormous pictures on stone, so that they appeared to the Frenchmen who recently saw them like printed calico. We may regard them as so many leaves of books, which by means of their spatial and limited superficies arouse unlimited astonishment, feeling, and reflection in the human soul. Doors follow at frequent intervals, and alternate with each series of Sphinxes; or we find an open spot engirt throughout by a wall with columned passages to these walls. After that we get a covered place, which does not serve as a dwelling, but is a forest of pillars, the columns of which have no roofing but carry slabs of stone. After these Sphinx passages, series of columns, and structural walls over-flowered with hieroglyphics, after them a frontage building with wings, before which obelisks are erected and lions couched; or also, after forecourts, or a cincture of yet more narrow approaches, we reach the culmination of the entire construction, the real temple, the sanctuary (σηκὸς), according to Strabo of moderate proportions, which either contained no image of the god, or merely an animal image. This dwelling of godhead was now and again a monolith, as Herodotus, for example, narrates[50] in respect of the temple of Buto. This temple was worked out of one piece of stone to a length and breadth, which in each of its walls of equal size measured forty cubits, and as final roof to the same was placed a single stone with a cornice of four cubits' breadth. In general, however, these sanctuaries are so small, that no communion of worshippers could find room inside. Such a communion, however, is an essential concomitant of a temple; otherwise the same is merely a box, a treasury, a place where sacred images are conserved.

To such an extent buildings of this type run on for miles with their rows of animal figures, their Memnons, their immense doors, their walls and colonnades of the most stupendous dimensions, some of greater breadth, some of less, their isolated obelisks and much else, that while we wander

within works so huge and so calculated to excite our surprise, which in part possess merely a more restricted purpose in the diverse activities of the system of culture to which they belong the question is irresistible, what these masses of stone have to tell us of the Divine they secrete. For on closer inspection symbolical meanings are everywhere in-woven in these constructions in that the number of Sphinxes and Memnons, the position of columns and passages have relation to the days of the year, the twelve signs of the Zodiac, the seven planets, the great periods of the lunar cycle and other phenomena. To some extent we find here that sculpture has not yet freed itself from architecture; and in some degree again the really architectonic aspect of measure, interval, number of columns, walls, steps, and so forth is so treated, that the real object of these relations is not to be found in their own intrinsic character, that is, in their symmetry, harmony, and beauty, but is referable to their symbolical definition. And in this way all this work of construction asserts itself independently as an object in itself, as itself a cultus, in which both nation and king are united. Many works, such as canals, the lake Maeotis, and generally waterworks have a particular relation to agriculture and the floods of the Nile. An example of this we have in the statement of Herodotus[51] to the effect that Sesostris had the entire country, which up to this time had been ridden and driven over, cut up into canals to provide drinking-water, and in this way made horses and wagons useless. The main constructions, however, remained those buildings with a religious purpose, which the Egyptians instinctively piled up much as the bees do their cells. Their property was regulated[52], their other social conditions equally so, the soil of the country was extraordinarily fruitful, and required no laborious cultivation, so that we may almost say their agriculture merely consisted in sowing and harvest. We hear little of other interests and exploits, such as are common to nations, and, with the exception of the tales of the priesthood with reference to the

maritime undertakings of Sesostris, we have no account of sea voyages. Speaking generally, the Egyptians restricted their efforts to this work of construction within their own country. It is, however, what we have called self-substantive and symbolical architecture which forms the fundamental type of their imposing works and for this reason that the human ideal, the spiritual in its aims and external forms, has not as yet come to self-knowledge, or constituted itself the object and product of its free activity. Self-consciousness has not as yet ripened in the fruit, is not yet independently secured, but is restless, seeking, surmising, ever for producing without absolute satisfaction, and consequently without repose. It is only in the form that is commensurate with Spirit that mind essentially at home with itself finds satisfaction and finds its true definition in what it produces. The symbolical work of art on the contrary remains more or less indefinite. Among such creations of the Egyptian art of building we may include the so-called *labyrinths*, courts with columned approaches, circumambient paths between partitions, which entwine about in a mysterious fashion, but whose confusing intricacy is not constructed with the puerile object to make the means of exit a problem, but to create for the senses an intricate mode of motion that is dominated by mysteries of symbolical import. For these paths, as we have already indicated, imitate in their course that of the heavenly bodies and embody the same for imagination. They are in part constructed above the ground and in part underneath it, and in addition to their passages are furnished with chambers and halls of enormous size, whose walls are covered with hieroglyphics. The largest labyrinth which Herodotus himself saw was not far from the lake Maeris. He affirms[53] that its size exceeded his powers of description, and it surpassed the pyramids themselves. The building he ascribes to the twelve kings, and he describes it in the following terms. The entire building surrounded by one and the same wall consisted of two stories, the one

above and the other beneath the level of the ground. Taken together they enclosed three thousand chambers, each story containing fifteen hundred. The upper story which alone Herodotus was able to see was divided into twelve adjacent courts[54], with doors placed opposite to each other, six facing the North and six the South, and every court was engirt with a colonnade, constructed of white and carefully worked stone. From these courts, Herodotus continues, you have ingress to the chambers, and from these into the halls, and from the halls into other chambers, and from these chambers into the courts. According to Hirt[55] Herodotus only so far defines this latter relation to the extent that he places in the first instance the chambers in juxtaposition to the courts. With regard to the labyrinthine passages, Herodotus states that the numerous passages through the roofed-in chambers and the multitudinous incurvations between the courts had filled him with infinite astonishment. Pliny[56] describes them as obscure and tedious for a stranger on account of their windings, and when their doors were opened there was a noise in them like thunder; we also learn from Strabo, an evidence of importance, for he was an eye-witness no less than Herodotus, that the labyrinthine passages encircled the court spaces. It was the Egyptians who mainly built such labyrinths: but we find in imitation of Egypt a similar one in Crete, though of smaller extent, and also, too, in the Morea and Malta. Taking into consideration the fact, however, that, on the one hand, an art of building of this kind in its chambers and halls already approximated to the dwelling type, while, on the other, according to the delineation of Herodotus, the subterranean portion of the labyrinth, an entrance into which was forbidden him, had for its definite object the sepulchre of the founders of the building and sacred crocodiles — so that here the essential characteristic of the labyrinth was entirely the symbolic import in an independent sense — we may find in such works a point of

transition to the form of symbolical architecture, which in its own constituent parts begins already to approach the classic type of building.

3. THE TRANSITION FROM SELF-SUBSTANTIVE ARCHITECTURE TO THE CLASSICAL TYPE

However stupendous in size the construction we have just considered are the subterranean architecture of Oriental peoples such as the Hindoos and Egyptians, which offer many features of resemblance, are still more imposing and calculated to excite our wonder. Whatever aspect of grandeur and nobility is in this respect discoverable above ground presents no parallel to that which among the Hindoos is presented us beneath the earth in Salsette, which faces Bombay, and in Ellora, that is, in Upper Egypt and Nubia. In these extraordinary excavations what we have in the earliest examples exposed is the immediate necessity of an *enclosure.* The fact that mankind have sought protection in caves, and made their dwelling there and that entire peoples have possessed no other mode of dwelling is due to the compelling force of their needs. Caves of this kind existed in the land of Judaea, where in works of many stories there was room for thousands. There were also in the Harz mountains in the Rammelsberg near Goslar chambers, into which men crept for cover, and used to bring their provisions for safety.

(*a*) Of an entirely different type, however, are the Hindoo and Egyptian subterranean constructions to which we have alluded. In some degree they served as places of assemblage, subterranean cathedrals, and are constructions whose object was to excite religious wonder and concentrate the communion of spiritual life; they are united to designs and suggestions of a symbolical character, colonnades, sphinxes, Memnons, elephants, colossal images of idols, which, hewn from the bare rock, were as fully left

a component growth of the formless stone as the columns in such excavations were made to stand out in isolation from it. In front of the walls of rock these buildings were here and there wholly exposed to the light, in other parts they were entirely devoid of it, and illuminated merely with torches, while in other portions light was introduced from above.

Relatively to the super-terranean constructions these excavations appear as prior in time, so that we may regard the enormous spaces laid out above the soil as an imitation and efflorescence of similar tracts of land beneath it. In excavations there is no positive building, but we have rather a given material taken away. And to nest thus in the ground, to excavate is more natural to man than to seek for a material, and with it to construct and inform a mass of buildings. In this respect we may assume the cave to be utilized prior to the hut or dwelling. Caves are the extension of spatial covering instead of a limitation of such, or an extension which grows up as a limit and enclosure, in which the enclosure is already present. The subterranean construction consequently inclines to start with what is already present, and, in so far as it leaves the fundamental material as it finds it, is not erected with the freedom applicable to a configuration raised above the surface of the soil. In our view, however, these constructions already belong to a further stage of the art of building, however much they may also have features of a symbolical type, because they no longer are placed there as independently symbolical, but already possess the aim or purpose of an enclosure, a partition, a roof, within which more symbolical figures as such are set up. That which is connoted under the conception of temple and dwelling, both in the Greek and more modern use of the terms, we have here in their most natural form.

We may include in the above class the caves of Mithras, although we find them in a very different locality. The worship and ritual of Mithras originates in Persia. A cultus, however, of a similar kind was also

promulgated in the Roman Empire. In the Paris Museum we find a very famous bas-relief, which represents a youth in the act of striking an ox with a steel weapon. It was discovered in the Roman Capitol in a deep grotto beneath the temple of Jupiter. In these Mithras caves vaults are also met with, and passages which on the one hand appear definitely to symbolize by suggestion the course of the stars, and from another point of view also (precisely as still in our own time takes place in our free-mason lodges, where people are conducted through many passages and have to see dramatic scenes and much else) the ways, which the soul must pass through in its purification, albeit it may be true enough that this fundamental meaning is more fully and directly expressed in sculpture and other work than in architecture simply. In a connection somewhat similar we may also mention the Roman catacombs, the fundamental idea of whose construction was certainly something quite other than that of being subservient to aqueducts, sepulchres or any system of drainage.

(*b*) In the *second* place we may seek for our present use a more definite point of transition from the architecture of independent type in those constructions which have been raised as *housings of the dead*, partly in the form of excavations beneath the ground, and partly as buildings above it. More particularly among the Egyptians this kind of construction, whether subterranean or super-terranean, was associated with a realm of the dead, just as in general among the Egyptians it is a realm of the invisible which in the first instance receives a habitation and is placed before us. The Hindoo burns his dead, or suffers their bones to lie and moulder on the earth. According to the Hindoo's point of view mankind are, or become, god or gods, whichever way one cares to put it, and we are unable to find in their case this assured distinction between the living and the dead regarded as dead. Hindoo constructions, consequently, so far as they do not originate in Mohammedanism, are not dwellings for the dead, and appear generally to

belong to an earlier period as we assumed was true of the astonishing excavations described. In the case of the Egyptians, however, the contrast between living and dead asserts itself predominantly. That which is spiritual begins to separate itself essentially from what is material. We have here the resurrection of spirit in concrete individuality, the movement of that process. The dead are therefore retained fast as personality[57], and are secured and preserved securely above the conception of dissolution into Nature, that is into universal evanescence, flood and extinction. Singularity is the principle of the spiritual in its notion of independence, because spirit is only able to exist as individuality, that is personality. Consequently this honour paid to and preservation of the dead can only appear to ourselves as a first and important element in the definition of the existence of spiritual individuality, since it is here that singularity is asserted as maintained rather than abandoned, inasmuch as the body at any rate is treasured and respected as this Nature's own mode of individuality. Herodotus assures us, a fact we have already noticed, that the Egyptians were the first to declare that the souls of men were immortal, and despite the fact that the grasp on spiritual individuality is in their case very incomplete, in so far as in their view the deceased must for three thousand years pass through a whole series of animals belonging to land, water, and air, yet for all that in this conception, and in the embalming of the body, we find fixedly the notion of bodily individuality, and of the independent self-existence as separate from that body.

It is therefore also of importance in the arts of building that in these the separation of the spiritual, no less than the ideal significance, which[58] is independently represented, be carried into effect while the corporeal shell is set round it as a purely architectonic environment. The dwellings of the dead of the Egyptians constitute for this reason the earliest examples of the temple type. The essential feature, the central core of worship is a subject,

an individual object which appears of significance by itself, and expresses itself as distinct from its dwelling, which is thereby interpreted as purely a subservient covering. And no doubt it is not an actual man, for whose requirements a house or palace had to be built, but deceased objects that are without such needs, kings, sacred animals, around whom immeasurable constructions are enclosed.

Just as agriculture fixes the wandering of nomads in the stable possession of a definite locality, we may say that generally sepulchres, monuments, and the service of the dead unite mankind, and even offer to those who possess no States, no limitations of property, a place of *rendez-vous*, sacred places which they defend and refuse to have taken away from them. As an illustration we may cite the case of the Scythians, a nomad people, who retired everywhere, according to the narration of Herodotus[59], before Darius. And when Darius sent an embassage to them with the message that if their king deemed himself strong enough to offer resistance he should come forth to battle, but if he did not he ought to recognize Darius as his lord, Idanthyrsus met the same with the reply that they possessed neither cities nor tilled land, and had nothing to defend for the reason that Darius had nothing to ravage; if, however, Darius made a point of having a fight they possessed the sepulchres of their fathers, let him therefore dare to advance against these, he will then discover whether they will fight for their sepulchres or not.

The most ancient and imposing monuments erected to the dead we find in Egypt. They are the Pyramids. What most excites our wonder at first sight of these astonishing constructions is their extraordinary magnitude, which at once makes us reflect upon the duration of time, the variety, superabundance and persistence of human energies which is inseparable from the completion of such colossal buildings. From the point of view of form there is nothing in them to protract attention: in a few minutes we have

surveyed and taken in the entire effect. With this simplicity and uniformity of their form in view their object has ever been a subject of controversy. It is true that even the ancients, as for example Herodotus and Strabo, adduced the aim, which they subserved; but for all that both in former and more recent times, travellers and writers have contributed much that is fabulous and unwarranted in their reflections. The Arabs endeavoured to effect entrance by force, hoping to discover treasure in the interior of the Pyramids; such assaults, however, beyond disturbing much, have failed in their object to reach the actual passages and chambers. Europeans of a later date, among whom we may mention in particular for distinction, Belzoni, a native of Rome, and Caviglia of Genoa, have at last succeeded in ascertaining more accurate information with respect to the interior of these fabrics. Belzoni discovered the royal sepulchre in the Pyramid of Chephren. The entrances to the Pyramids were closed in the securest way by square blocks of stone, and it appears that Egyptians endeavoured in their construction so to effect matters that the entrance, even when discovered, could only be followed up and opened with the greatest difficulty. This proves to us that the Pyramids remained closed and could not be again used. Within their interior explorers have found chambers, passages, which point by suggestion to the ways, which the soul undertakes after death in its course and transmigration, great halls, channels beneath the earth at one time descending, at another mounting up. The royal sepulchre of Belzoni runs on in this way hewn out of the rock for a mile. In the principal hall stood a sarcophagus of granite, sunk in the ground; but all that was discovered in it was the remains of animal bones of a mummy, probably that of an Apis. The whole, however, proved beyond a doubt that the object in view was that of being a dwelling for the dead. The Pyramids differ in age, form, and size. The most ancient appear to be stones piled on one another in a more or less pyramidal shape. The more recent ones are

constructed with uniformity; some are somewhat flattened out at the summit, others run up entirely to a point. On others have been found deposits, an explanation of which may be gathered from the description Herodotus[60] gives us when referring to the Pyramid of Cheops of the manner in which the Egyptians carried out such works, so that Hirt includes such among the Pyramids which remained unfinished[61]. In the older Pyramids according to the latest evidence of Frenchmen the chambers and passages are more winding; in the more recent ones they are simpler, but entirely covered with hieroglyphics, to interpret which throughout will take several years.

In this way the Pyramids, despite all the wonder they arouse of their own accord, are really nothing but crystals, mere shells, which enclose a kernel, that is a departed spirit, and serve as custodians of his still consistent bodily presence and form. In this departed and deceased person, who secures an independent reproduction, we fail to find consequently any significance[62]; the architecture, however, which up to this point independently possessed its significance in itself as architecture, is now divided in its aim, and in this division is *subservient* to something else, whereas sculpture receives the function to give body to the genuine ideal aspect, although in the first instance the individual figure in its unique and immediate natural shape is retained. We find consequently, on a general survey of the Egyptian art of building, on the one hand, the self-subsistent symbolical buildings; on the other, however, and more particularly in everything which is attached to the monuments of the dead, the specific determination of architecture to be an enclosure and nothing more, already clearly asserts itself. It is an essential concomitant of this, that architecture not only be limited to the construction of excavations and caves, but attest itself as an inorganic Nature built by human hands on the spot where men have actual need of it, and for a definite purpose will it to be.

Other nations have raised monuments of the same kind, sacred buildings as dwellings of the dead bodies, over whom they happen to be erected. As examples we may instance the mausoleum in Curia, and of more recent date that of Hadrian, the still existing Englesburg in Rome, a palace of careful construction raised in honour of a dead person, all of which were even in antiquity famous works. According to the description of Uhden[63] we may also mention in this connection a type of mortuary, which in its arrangement and environment imitated in its smaller aspects temples dedicate to gods. A temple of this kind possessed a garden, arbours, a spring, a vineyard, and moreover chapels, in which portrait statues of gods were placed. More particularly in the time of the Roman Empire were such monuments to the dead built with statues of the deceased under the image of gods such as Apollo, Venus, and Minerva. Figures like the above, no less than the entire construction, consequently received during that age the significance of an apotheosis and a temple in honour of the dead man, just as also among the Egyptians the process of embalming, the emblems placed thereby, and the sarcophagus attest that the deceased was treated as a god-like Osiris[64].

The most imposing and least complex constructions of this kind, however, are the Egyptian Pyramids. In this type we have the peculiar and essential line of the art of building, that is the straight one, and in general terms the uniformity and abstract simplicity[65] of forms. For architecture, as merely enclosure and inorganic Nature, or Nature that is not itself vitally and essentially suffused by the indwelling spirit in an independent mode, is unable to possess form except as one which is external to itself; external form, however, is not organic, but abstract and purely referable to the organs of sense[66]. However much the Pyramid already begins to receive the determining characteristics of the dwellings, yet the rectangular principle is still not throughout predominant, as it is in a real dwelling-house; it has still an independent determinacy, which is not merely of service to the purpose

for which it is erected, and consequently closes up of itself by a process of gradation directly from the foundation to the apex.

(*c*) It is from this point that we may make the transition from the independent type of building to that of an art of construction, which is serviceable of a *purpose.*

There are two points of departure to this later type. There is on the one hand *symbolic* architecture, and on the other practical necessity and the *impulse of purpose* to subserve that necessity. In the case of symbolical forms, as we have already had occasion to observe, architectonic purpose is merely an incidental feature, merely an external mode of co-ordination. The dwelling-house, on the contrary, erected as necessity itself, requires posts of wood, or just walls standing up straight with beams, which are laid across them at right angles, and a roofing, and constitutes, the other extreme. There can be no question that the necessity of this real and effective expediency makes its appearance as the result of its own demand. The distinction that may be raised, however, in answer to the question, whether genuine architecture — as we shall shortly have to consider it as the classic art of building — takes its rise solely in this necessity, or is to be deduced from independent and symbolical works, which conducted us of their own accord to buildings devoted to service, is the point in essential dispute.

(*α*) It is the force of circumstances which brings to the fore forms in architecture which are wholly stamped with a useful purpose, and the abstract deductions of science, such as the rectilinear line, the right angle, and the smooth surface. For in serviceable architecture that which constitutes the real object, is, in its independence, as a statue, or more closely as human individuals, that is community, a people, brought together for objects of general significance, which no longer have as their aim the satisfaction of physical wants, but are such in a religious and political sense. In a special degree the need asserts itself to shape an enclosure for the

image, the statue of the gods, or generally for that which is independently placed before us and actually present as sacred. Memnons, Sphinxes, and the like stand up in the open, or in a grove, that is in the external environment of nature. Images of this kind, however, and still more human images of gods, are borrowed from another realm than that of immediate Nature. They belong to the world of imagination, and come into existence through the artistic powers of mankind. The purely natural environment is therefore not sufficient; they require for their external frame a ground and an enclosure, which shall be derived from the same source as their own, in other words, such as are the product of the imagination, and have received their form by means of artistic effort. It is only in an environment created by art that the gods find themselves at home[67]. In such a case, however, this external frame does not possess its object in itself, but it subserves something other than itself, and is subject to the principle of purpose or expediency.

If, however, these, in the first instance, purely serviceable forms are exalted to an expression of beauty they are unable to persist in their original abstract mode, and are forced to accept, in addition to what is merely symmetrical and harmonious, that which is organic, concrete, essentially itself conclusive and varied. And because this is so men are forced to reflect over distinctions of determinating form, no less than the express emphasis to be made on certain aspects of form, which is wholly superfluous where the question is only one of a definite purpose to be attained. A beam, for example, is from one point of view that which is carried forward in a straight line; at the same time, however, it terminates at both extremes. In the same way a post which has to support either rafter or roof stands on the ground and reaches its terminating point where the rafter rests upon it. The architecture of service asserts distinctions of this kind and gives form to them by means of art; an organic design, on the contrary, such as a plant, or

a human being, ay, whether we look at such above or below, but in any case throughout, has to be organically embodied, to be differentiated in the latter case consequently by feet and head, or in the former by roots and corona.

(*β*) Conversely symbolic architecture takes its point of departure more or less from organic forms of this kind, as we see is the case with sphinxes, memnons, and so forth; yet it is also unable wholly to exclude in its walls, doors, beams, obelisks, and the rest, the principle of the straight line and uniformity, and is generally obliged to accept the assistance of such principles appertinent to the genuine art of building as equality of size, interval of relative position, rectilinear progression of rows, in short, order and regularity when it proposes to place in a series and to set up in accordance with architectural design the colossal sculptured figures to which we have referred. By doing so it unites in itself both principles[68], whose union brings for result an architecture, the beauty of which is promoted along with the object to which it is subservient, albeit in the symbolic type these two aspects[69] still lie in separation side by side instead of being fused in unity.

(*γ*) We may therefore so conceive the transition that on the one side the art of building, hitherto self-subsistent in type, is forced to modify under scientific principles[70] the forms of organisms in the direction of regularity, and to pass into the province of proposed expediency; while conversely what is entirely such intended purpose in the form moves in opposition to the principle of the organic world. Where these two extremes come together, and mutually pass into one another, we get what is really beautiful classic architecture.

We may recognize this union, as it actually arises, clearly in the transformation now introduced of that which we already have met with in the architecture which was anterior under the form of columns. In other

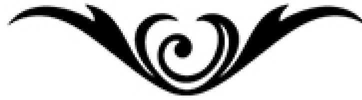
words, it is true that from one point of view walls are necessary to make an enclosure; but walls, too, can stand up independent, as we have already proved with examples, without making the enclosure complete, to which a roofing, no less than an enclosure of the sides, essentially contributes. But a roofing of this kind has to be supported. The simplest way of doing this is by columns, whose essential and, at the same time exclusive, rationale consists here in being simply *supports*. For this reason walls are really a superfluity is so far as it is only a question of support. For supporting is a mechanical relation, and belongs to a province of gravity and its laws. And in this[71] gravity the weight of a particular body is concentrated in its point of gravity, and must be assisted at this centre in remaining horizontal without a fall. This is precisely what the column does, so that with it the power of support appears to be reduced to the minimum limit of exterior means to effect this. What a wall at great cost[72] effects, is equally effected by a few columns. It is a very beautiful characteristic of classic architecture not to set up more columns than are actually necessary to carry the weight of the rafter and that which reposes thereon. In genuine architecture columns, for purposes of mere decoration, are not truly beautiful. For the same reason also columns which stand up entirely alone do not perform their true function. No doubt triumphal columns have been erected, such as the famous ones in honour of Trajan and Napoleon: but these, too, are really but a pedestal for statues, and moreover covered with sculptured reliefs to commemorate and glorify the hero, whose image they carry. In the case of the column, then, it is of exceptional importance to see how in the course of architectural development it is compelled to divest itself of the concrete form of Nature before it can secure its more abstract form, the form, that is, which is as compatible with a definite object as it is with beauty.

(*αα*) Independent architecture, on account of the fact that it starts with organic images, makes use of human shapes, as, for example, we find in

Egypt figures in some measure at least human, such as Memnons and the like, are utilized. This is, however, a mere superfluity, in so far, that is, as a definition of this character is not the true medium of support. We find among the Greeks that Caryatides are used in another mode and under a more severe obedience to rule to support superimposed weight, but such cannot be extensively employed. Moreover, we can only regard it as a misuse of the human form to crush it together under such burdens, and it is for this reason that Caryatides receive the character of the oppressed; their drapery suggests a state of slavery under which it is a degradation to carry such burdens.

(*ββ*) The more natural organic form for pillars and supports which have to bear a weight is consequently the tree, plant-life generally, a stem, a thin stalk which strives upwards in a vertical direction. The hole of a tree already carries of its own nature its crown of branches, the blade of corn the ear, the stem the flower. These forms, too, the Egyptian art of building, which has not as yet attained the liberty of viewing them in their abstract intension, borrows directly from Nature. In this respect the grandiose quality which we discover in the style of Egyptian palaces or temples — the colossal proportions of its rows of columns, the huge number of them, and withal the imposing mutual relations of the entire structure, has ever filled the spectator with wonder and astonishment. In these colonnades we do not find that all columns have the same form; they alternate between one, two, or three types. Denon, in his work on the Egyptian expedition, has collected a great number of such types. The combined effect is not as yet any uniform shape based on abstract principles of selection; rather the foundation is the shape of an onion, a reed-like efflorescence of leaf from the bulb, or, in other examples, a compression together of the root-leaves according to the manner of several kinds of plant. From this base, then, the thin stem breaks upwards straight, or mounts as column with twisted coils, and the capital is

also a separation of leaves from branches which suggests the process of a flower. The imitation, however, is not true to Nature, but the plant-like forms are drained off under the architectural impulse, and made to approximate to circular, geometrical, and regular forms, or straight lines, so that such columns, in their entirety, resemble what are usually described as arabesques.



(*γγ*) This is not the place to enter into a general discussion of the *arabesque* for the reason that notionally it marks precisely the transition from the architecture which adopts as its basic form the natural organism to that which by its adoption of a more severe regularity is more strictly architectonic. When, however, the art of building has become free in its definitive character it relegates arabesques to the function of decoration and ornament. They are then pre-eminently forms of plants strained off, so to speak, or forms which originate from plants together with entwined forms of animals and human beings, or forms of animals in their passage over to plant-life. In so far as they purport to authenticate a symbolical significance the transitional passage between the different spheres of the animal kingdom hold good for it. Apart from such an interpretation they are simply the play of the imagination in the selection, combination and articulation of the most diverse forms of Nature. For architectural ornamentation of this kind, in the invention of which the imagination finds scope for its activity in the most varied creations of every kind, not even excluding utensils and drapery, the fundamental determinant and type is this, that whether it be plants, leaves, flowers, or animals, all are made to approximate to the abstract figures of science, in other words the inorganic. For this reason we frequently find arabesques to be stiff, untrue to organic life; and it is on this account that they are not unfrequently condemned and art is blamed for the use of them. This is exceptionally true of painting, though Raphael himself did not scruple to paint arabesques in great profusion, characterized with the

highest charm, nobility of feeling, variety, and grace. No doubt arabesques are an antithesis to nature, whether we compare them with organic forms or the rigid laws of mechanics; but an opposition of this kind is not merely a right of art generally, but even an obligation under which architecture is bound. It is only by this means that living forms in other respects unfitted for the art of building are made adaptable to the truly architectural style and brought into harmony with it. Such an adaptability is offered in an exceptionally close degree by vegetable Nature, which is also in the East utilized to an extravagant extent in arabesques; in other words plants are not as yet individual objects which possess feeling, but naturally present themselves as adapted to architectural design, by virtue of the fact that they form coverings and protection against rain, sunlight, and wind, and, generally speaking, do not possess the free oscillation[73] of lines which breaks forth from the regularity of scientific conceptions[74]. Architecturally used the regularity of leaves already present is yet further subjected to rule in the definition of rondure and straight line, so that by this means everything which it is possible to regard as distortion, unnaturalness, or stiffness in the plant-forms is fundamentally to be considered as a transformation adapted to the requirements of what is genuinely architectural.

In some such way in the column the real art of building passes from that which is purely organic imitation to the definite purpose of scientific rule, and from this to a position which again approximates to the organic result. We find it necessary to draw attention to this twofold point of departure from the actual necessities and the purposeless self-subsistency of architecture, because the true type unites both principles. The beautiful column originates in the natural form, which is then transformed into the post, that is, it submits to the uniformity and scientific precision of form.

CHAPTER II

CLASSICAL ARCHITECTURE

THE ART OF building, when it has attained the position peculiarly its own and adequate to its notional content is subservient in its products to an end, and a significance which it does not itself essentially possess. It becomes an inorganic environment, a whole that is co-ordinated and built conformably to the laws of gravity, whose configurations are subject to that which is severely regular, straight, rectangular, circular, the relations of definite number and quantity, that which is essentially limited measure and strict conformity to rule. Its beauty consists in this very relation to purpose, which, in its freedom from direct[75] admixture with what is organic, spiritual, and symbolical, and despite the fact that it subserves an end, nevertheless combines in an essentially exclusive totality, which suffers its own aim to appear through all its modifications, and in the harmonious co-ordination of its relations clothes that which is purely adapted to purpose in the forms of beauty. Architecture, however, at this stage[76] corresponds to its real notion, for the reason that it is not in a position to endow that which is in the most explicit sense spiritual with a fully adequate existence, and is consequently only able to inform what is external and devoid of spirit in its contrasted appearance with that which is spiritual.

We propose, in our consideration of this art of building, in which the relation of service is as truly a characteristic as that of beauty, to adopt the following course of argument.

In the *first* instance we have to establish the *general notion* and character of the same.

Secondly, we shall have to adduce the *particular* fundamental determinants of the architectonic types which are deducible from the ulterior purpose which the classical work of art is erected to subserve.

Thirdly, we propose to survey the concrete reality which results from the development of classical architecture.

I do not, however, propose in discussing any of the above relations to enter into detail, but will limit myself to points of most general significance, a restriction more easy to observe in the present case than it was in that of the symbolical type of building.

1. THE GENERAL CHARACTER OF CLASSICAL ARCHITECTURE

(*a*) In conformity with the principle I have already more than once adverted to the fundamental idea of the genuine art of building consists in this, that the spiritual import is not exclusively reposed in the work of construction itself, which by this means becomes an independent symbol of ideal signification[77], but, with the converse result, that this significance secures its free existence outside the limits of architecture. This existence may be of a twofold character, to the extent in other words that another art of extensive range — I refer, above all, to the art of sculpture of the true classical type — sets before us and gives independent form to the significance, or the individual man in himself receives and gives effect to the same in the active verity of his life. Apart from this[78], these two aspects may still appear together. When, therefore, the Oriental architecture of the Babylonians, Hindoos, and Egyptians, on the one hand, gave symbolical form, in images of independent consistency, to that which was reckoned among these people as the absolute and true, or, from another aspect, enclosed, despite its external natural form, that which was conserved after death — in contrast to this what we find now is — whether we regard it

relatively to art's activity, or to the life of actual existence — that the spiritual is *separated* from the work of construction in *independent guise* for itself, and architecture becomes the *vassal* of what is spiritual, which constitutes the real significance and the determinating end. This end is consequently predominant. It controls the entire work; it determines the fundamental form of the same no less than its external skeleton, and neither suffers the material nor the individual's imagination and caprice to assert their independence in a self-substantive way, as was the case in symbolical architecture, or to develop, over and beyond the true purpose of the work, a superfluity of manifold parts and configurations, as is the case in the romantic type.

(*b*) In considering a construction of this character we have, then, first to ask ourselves not merely what are the circumstances under which it was erected, but what is its aim and purpose. To make its construction compatible with such considerations, to have a due regard for climate, position, and the environing landscape, to create a whole, one in spontaneous co-ordination, by a regard for all these aspects as subservient to one purpose, this is the task stated broadly, in the entire fulfilment of which the instincts and genius of the artist will appear conspicuous. Among the Greeks we find that it is public buildings, temples, colonnades, and halls utilized for the ordinary rest and commerce of the day, approaches, such as the famous ascent of the Acropolis in Athens, which are pre-eminently the objects of the builder's art. Private residences, on the other hand, were of a very simple character. With the Romans, on the contrary, it is the luxurious character of private houses, especially villas, which becomes prominent; and we may say the same thing of imperial palaces, public baths, theatres, circuses, amphitheatres, aqueducts, and springs. Buildings of this type, however, the utility of which throughout remains the commanding and directing principle, are merely able to accept beauty in a more or less

decorative sense. The object most compatible with freedom of treatment in this sphere is that of religion — the temple-house as the enclosure of an individual which itself is appropriated by fine art, and placed before us by sculpture as the statue of the god.

(*c*) In the pursuit of aims such as those above mentioned, then, genuine architecture appears to be more free than the symbolic type of the previous stage, which seizes on the organic forms from Nature, nay, more free than sculpture, which is compelled to accept the human form it finds, and unites itself with them and their general relations as presented it. Classical architecture rather invents its forms and their configuration, so far as the content is concerned, from ends of spiritual import and in respect to form from human reason without any prototype. This greater freedom must, in a relative sense, be admitted; but the province in which it is exercised remains restricted, and the treatment which belongs to the classical art of building, on account of the rationality[79] of its forms is, taken as a whole, somewhat of an abstract and dry character.

Frederich von Schlegel has described architecture as a frozen music; and in truth both these arts repose on a harmony of relations, which admit of being referred to number, and are consequently readily grasped in their fundamental characteristics. In our own case the fundamental determinant for these essential traits and their simple, more serious and imposing, or more charming and elegant relations is supplied by the dwelling-house, that is, walls, columns, beams brought together in the wholly crystalline forms of scientific deduction. What the relations are we are not permitted to reduce to the bare determinants of number and measure. But an oblong, quadrilateral figure with right angles is more pleasing than a square, because in the case of the oblong we are more thus affected both by equality and inequality[80]. If the one dimension, namely breadth, is half as large as the other, we have a relation which pleases; with an oblong which is long and

narrow the reverse is the case. Along with this the mechanical relations of support and being supported must likewise be maintained in their genuine measure and law; a heavy entablature, for instance, cannot rest on slender and delicate columns, or conversely great structures be prepared in order after all to lay on them something very light. In all these mutual relations, such as that of the breadth to the length and height of the building, the height of the columns to their thickness, the intervals and number of the columns, the character and variety or simplicity of decorations, the size of many plinths, borders, and so forth, a secret principle of rhythm[81] prevails among the ancients, which the instinct of the Greeks before all others has discovered; from which he may no doubt now and again deviate in points of detail, but the fundamental relations of which he is in general bound to preserve in order that he may not fall away from beauty.

2. THE FUNDAMENTAL DETERMINANTS OF ARCHITECTURAL FORMS TAKEN SEVERALLY

(*a*) We have already alluded to the old controversy whether the material of wood or stone is to be accepted as the point of departure in building, and whether also it is from this difference of material that the architectural types proceed. For the real art of building at least, in so far as it lays emphasis on the aspect of ultimate purpose and elaborates the fundamental type of the dwelling on the lines of beauty we may accept wood as the more original of the two.

This is the conclusion of Hirt, following in this respect Vitruvius, and his conclusion has been much disputed. I will in a few words offer my own view on the matter in dispute, In the ordinary course of such reflections we seek to discover the abstract and simple law for a concrete result assumed as already present. It is in this way that Hirt looks for the basic model of Greek buildings, in like manner the design[82], the anatomical framework, and

finds it, so far as form and the material connected with it is concerned, in the dwelling and building of wood. No doubt a house as such is built mainly as a dwelling, a protection against storm, rain, weather, animals, and human beings, and requires an enclosure that is complete, in order that a family or a larger community of men may collect in independent seclusion and may look after their necessities and pursue their avocations in such seclusion. The house is a structure throughout with a definite purpose, a creation of mankind for human objects. For this reason we find him occupied upon it in many ways and with many objects, and the structure is articulated in an aggregate pile of all kinds of mechanical ways of mutual interlacement and imposition[83] in order to hold in position and secure, according to the laws of gravity, what men are compelled to look after, that is, the making stable what is erected[84], the closing it in, the support of what is superimposed, and not merely in the way of support, but, where the structure rests horizontally, the preservation of it in such a position, and, further, the uniting of all that clashes together at nooks and corners and so on. Now it is quite true that the house makes it necessary that the enclosure should be complete; and for this walls are most serviceable and safest; and from this point of view the building of stone appears most to answer the purpose. We may, however, with equal ease construct our fence with posts standing in juxtaposition, upon which then beams will rest, which at the same time both bind together and secure the perpendicular posts. Finally we come to the cover of all and roofing. In the temple house, moreover, the fact of enclosure is not the main fact of importance, but the feature of support and being supported. For this mechanical result the wooden structure is obviously the nearest to hand and the most natural. For the post, as that which supports, which at the same time requires a means of conjunction, and suffers the same to weigh on it in the shape of the cross-beam, constitutes here all that goes to the root of the matter. This essential division of parts and connection as well as the

association of these aspects for a definite purpose belongs to the very nature of a wooden structure, which has its necessary material directly supplied it by the tree. In the tree we find already, without working upon it to any considerable or laborious extent, both post and beam, in so far as, that is, the wood already by itself possesses a definite form and consists of separate lengths, more or less in the straight line, lengths which can be brought together into rectangular corners no less than those which are acute or obtuse, and in this way provide corner pillars, supports, cross-beams and roof. Stone, on the contrary, never at any time possesses a form so definite. In contrast to the tree it is a formless mass, which first must be intentionally isolated and worked upon, in order that it may fit in juxtaposition to or superposition on other pieces and so once more be brought together with such. It requires, in short, several processes before it receives the form and serviceableness which wood already possesses independently. Moreover, stone material, when it is used in great masses, invites rather excavations and generally speaking, being *ab initio* relatively formless, is capable of every kind of form, for which reason it is rather the congenial material for the symbolical as also the romantic types of building, while wood, by reason of its natural form of straight stems, is demonstrably without mediation more serviceable to that more severe type of purpose and observance of rule, which is the fountain-head of classical architecture. In this respect the structure of stone is mainly predominant with the self-substantive type of building, although even among the Egyptians, in their colonnades bordered with plinths, other considerations supervene, which the structure of wood is able more readily and in the first instance to satisfy. Conversely we do not find that classical architecture restricts itself entirely to buildings of wood, but, on the contrary, where it is elaborated in conformity with beauty, executes its buildings in stone; but in such a way, however, that we are from a certain point of view still able to recognize in

the architectural forms the original principle of the wood structure, if also from a further one definite relations attach which do not belong to that kind of building as such.

(*b*) The points of fundamental importance, which emphasize the dwelling-house as the basic type of the temple, may be in all essential particulars enumerated as follows. If we consider with closer attention the house in its mechanical relation to itself we shall find, in accordance with what we have already stated, on the one hand, masses of architectural form which serve as *support* and, on the other, those that *are supported* both being united for stability and security. Thirdly, we have before us the definite aspect of enclosure and limitation according to the three dimensions of length, breadth, and height. A construction, moreover, which, by the fact of its being a mutual correlation of definite aspects distinct from each other, is a concrete whole, is bound to declare this unity in its constitution. So we find here that essential differences arise which perforce assert themselves no less in their division and specific elaboration than they do in their rational *connexus.*

(*α*) Of first importance in this respect to consider is the aspect of service in the way of *support.* When we speak of masses that support we commonly, under the influence of every-day needs, think of the wall as the most secure and reliable means of support. Support as such, however, as we have already seen, is not the exclusive principle of the wall; for the wall serves essentially as a means of enclosure and connection, and for this reason is a predominant feature in the romantic type of building. What is the peculiarity of Greek architecture is this, that it gives direct form to the principle of support by itself, and for this object employs columns as a fundamental contribution to the purpose and beauty of its architecture.

(*αα*) The aim of the column is to support and only this; and although a series of columns set up in a straight line make a boundary, such an

enclosure falls short of a secure wall or partition, and is, in fact, expressly cancelled by the genuine partition and placed in a position of free independence. Owing to this exclusive object of support which pertains to the column, it is of first importance that it should display the aspect of such a purpose relatively to the weight which rests upon it. Consequently it should neither be too strong nor too slender, nor again too compressed, not mount upwards to such a height and with such ease as though the weight upon it was not treated seriously.

(*ββ*) And just as this column is thus differentiated from the enclosing wall, or fence, it is further from another point of view distinct from the mere *post.* In other words, the post is fixed directly in the ground and ceases with like directness at the precise point where a weight is reposed upon it. For which reason its determinate length, its commencement and termination equally appear as a negative limitation by means of something else, as a determinacy which is the result of chance, which it does not possess in its own right. Commencement and termination, however, are defining characteristics, which are part of the very notion of the supporting column, and consequently must declare themselves in it as the conditions[85] of its own substance. This is the ground of the fact that architecture, in the elaboration of its beauty, assigns to the column a base and a capital. In the Tuscan order, no doubt, we find no base; the column springs immediately from the ground. This being so, however, the length appears to the vision as something accidental. We are ignorant whether the column has not been to some undefined extent driven into the soil by the superimposed weight. In order that its commencement must not expose this undefined and accidental appearance it must with intention have the foot assigned to it, on which it stands, and which expressly enables us to recognize the commencement as in reality such. Art will therefore affirm as part of its function that the column begins at a certain place and for the rest it will make the security,

and stable subsistence obvious to the eyes, and set the vision at rest in this respect also. For similar reasons our column should terminate in a capital, which is quite as much evidence of the real function of being a support as it is an affirmation of the fact that the column terminates here. This conception of a commencement and conclusion which are both deliberate is what affords us, in fact, the profounder explanation of base and capital. An analogous case is that of a cadence in music, which requires a secure resolution, or that of a book which should terminate without a full stop, or should start off without a capital letter, in the making of which, however, especially in the Middle Ages, large illuminated letters have been employed, with similar decorations at the work's conclusion, in order to bring prominently before the mind the facts of commencement and termination. However much, therefore, both base and capital appear to exceed what is obviously required we must not regard them as a decorative superfluity, or think of simply deducing them from the example of Egyptian columns, which still imitate the type of the vegetable kingdom. Figures of organic design, such as are represented by sculpture in animal and human form, begin and terminate in the free outlines they themselves present, for it is the rational organism itself, which gives outline to the form working thereon from its own intrinsic nature. Architecture, on the contrary, possesses for the column and its shapes nothing beyond the mechanical relation of support, and the spatial distance from the ground to the point where the weight that is supported terminates the column. Art, however, is bound to emphasize and disclose the particular aspects which lie together in this determinate relation for the reason that they are essential features of the column. Its precise length and its twofold boundary both above and below, that is, no less than its relation as support, must consequently not appear as coming to it incidentally and by virtue of something else, but must also be represented as immanent in its very being.

With respect to the form of column other than its base and capital, it is in the first place round, circular-shaped, for it has to stand up in free and independent self-seclusion. The most essentially simple, securely exclusive, rationally defined[86], and most regular line is in fact the circle. For this reason the column already proves from its shape that it is not adapted to form an even surface when placed in adjacent rows, as is the case with adjacent posts which are squared to the rectangular corner, and so present walls and partitions, but it has merely the object to offer a support under its own self-limitation. Moreover the columnar structure is ordinarily reduced in size gradually, as it ascends from one-third of its height, it becomes less in circumference and thickness, because the portions beneath have to carry that above, and it is felt necessary to emphasize and make obvious also this mechanical relation of the several parts of the column itself. Finally, we frequently find that columns are grooved; the reason of this is twofold, first, essentially to diversify the simple form, and secondly to make the columns appear more thick by means of such a division where this is necessary.

(*γγ*) Although, then, the column is set up in independent isolation it has none the less to make it appear evident that it is not placed there for its own sake, but as subservient to the mass which it is erected to support. In so far as the house requires a boundary on every side the singular column is therefore not sufficient, but others have to be placed adjacent to it, in other words we come upon the definite conception of a diversity of columns placed in a *series*. And when several columns support the same weight this common service is at the same time that which determines the equal height which they all possess and which unites them together, in other words the beam. This marks the transition from the aspect of support to the opposed object supported.

(*β*) That which columns support is the *entablature* superimposed. The relation of most importance to be considered here is that of *rectangularity.*

Not merely in its relation to the ground, but also in that to the entablature the supporting structure must be rectangular. For the horizontal position is by the laws of gravity that which is alone intrinsically the most stable and fitting, and the right angle the only definitely secure one. The acute and obtuse angles are, on the contrary, indefinite, and both vary in their degree and are subject to contingency.

We may differentiate between the component parts of the entablature as follows:

(*αα*) The *architrave*, that is, the main beam, rests immediately upon the columns which stand adjacent in a direct line of equal height; this unites the columns together and places on them a weight shared equally. As beam, and nothing more, it merely requires the form of four level surfaces mutually related as rectangular in all three dimensions and their abstract regularity. Owing to the fact, however, that the architrave as to one part of it is supported by the columns, and in another constitutes the stay of the rest of the entablature, and it is from this latter again that itself receives the necessary relation of being a support, progressive architecture also places in external relief this twofold aspect of the main beam by emphasizing in the upper portions of the aspect of support by means of jutting plinths and so forth. In this respect therefore the main beam is not merely related to the columns which support it, but in like degree to other burdens which repose upon it.

(*ββ*) These in the first instance constitute the *frieze.* The border or frieze consists in one part of it of the tops of the joists[87], which rest on the entablature, in another part of the spaces between the same. For this reason the frieze contains more essential differences than those distinguishing the architrave, and is bound to emphasize them more sharply, especially in the case where architecture, although executed in stone materials, follows more stringently the fundamental type of the wood construction. This is supplied

us by the distinction between triglyphs and metopes. In other words triglyphs are the tops of the beams which are divided into three spaces, the metopes are the rectangular spaces between the separate triglyphs. In former times they were in all probability left bare, in later, however, they are filled up[88], nay, even covered over and decorated with reliefs.

(*γγ*) The frieze, moreover, which rests on the entablature, carries the *wreath* or *cornice.* The function of this is to support the roof, which completes the whole upwards. Here we at once meet with questions of what form this final limitation is to be. For we may have in this respect two kinds of termination, either the horizontal and rectangular, or the one inclined to an acute or obtuse angle. If we look at the mere question of natural necessity we shall see that Southerners, who suffer little from rain and storm, merely require protection from sunlight; in their case a horizontal and rectangular roofing of house is likely to suffice. Northerners, on the contrary, have to protect themselves against inevitable showers of rain, against contingency of snow, that the weight may not prove too great; they require inclining roofs. At the same time, in the case of a fine art of building, mere necessity is not only of account; as art it has also to satisfy the profounder requirements of what is pleasing and beautiful. What mounts upwards from the ground must be conceived with a base, a foot, on which it stands and which serves it for *support*; and in addition to this columns and the partitions of genuine architecture supply us visibly with the *means of support.* That which closes all above, the roofing, has no longer to support a weight, but merely to be supported, and is bound to declare in itself this definite aspect that it no longer supports anything. In other words, it must be so constructed that it is actually unable to support, and consequently fine down to an angle, whether it be acute or obtuse. Ancient temples have in consequence no horizontal roofing, but two roof surfaces which meet at obtuse angles, and it is out of consideration for beauty that the building is

thus terminated. In short, roof surfaces that are horizontal do not give us the appearance of a building entirely complete; a horizontal flat may always add further weight to its height; this the line in which inclining roof surfaces terminate is no longer able to do. To take an analogous case in the art of painting, it is the pyramidal form in the grouping of figures which best satisfies artistic taste.

(*γ*) The final determining factor which we have to consider is that of the *enclosing*, the *walls*, and *partitions.* Columns no doubt support and form a boundary, but they do not enclose; they are, on the contrary, as such boundary, incompatible with the interior which is hemmed in by walls. If we require such an absolute enclosure we must have also thick and solid dividing walls erected. This is actually the case in temple construction.

(*αα*) We have nothing further to add with respect to walls except the fact that they must be built in a straight and even line and perpendicularly for the reason that walls that rise obliquely to acute and obtuse angles present the threatening aspect of collapse, and possess no direction once and for all securely defined; it can merely appear as a matter of chance that they are reared in whatever more acute or obtuse angle it may happen to be. The demand of scientific rule and purpose alike is here also once more for the right angle.

(*ββ*) Owing to the fact that walls act as enclosures no less than as means of support, while we restricted the true function of the column to that of mere support, we approximate to the conception that where we have to satisfy these two distinct needs of support and enclosure columns may be set up and may be united to one another by means of thick walls in such partitions; it is thus that we get *half columns.* In this way, for example, Hirt, following Vitruvius, makes a start in his original type of construction with four corner-posts. If the necessity of an enclosure is to be satisfied no doubt our columns, if we are obliged to include such, must be walled up and it is

not difficult to prove that half columns date from remote antiquity. Hirt, for instance[89], affirms that the employment of half columns is as old as the art of building itself, and deduces their origin from the circumstance that columns and piers supported and carried the roofing and other superimposed structures, but at the same time rendered partition walls necessary as a protection against sun and inclement weather. Since, however, the columns already supported the main building in a sufficient manner, it was not necessary to erect partition walls of either so thick or firm a material as the columns, and consequently this latter, as a rule, abutted on the exterior of the building. This theory of their origin may be correct, but for all that half columns are repugnant to a rational view of them; we have, in short, here two ends standing side by side in *opposition*, and essentially *confounding each other*, without any law of necessity being disclosed. It is of course possible to defend half columns, if the point of departure in considering even the column is so strictly that of the structure of wood, that we regard their essential function to be that of an enclosure. Placed in thick walls, however, the column has lost all its significance; it is degraded to the mere post. The true column is in its nature round, essentially complete, and expresses by this very trait of exclusiveness in a visible way that it is antagonistic to an even surface, and, consequently, every inclusion in a wall. If, therefore, we desire to have the support of walls such must be even, not circular columns, but surfaces which can be extended evenly in a wall.

As far back as 1773 Goethe exclaimed with spirit to the like effect in his youthful essay, “On the German Art of Building”: “What does it matter to us, you philosophical art-critic of the latest French school, that original man, spurred on by his needs to invent, drove into the ground four trunks, then fastened four poles on top and covered the whole with branches and moss. And after all it is wholly false to say that this hut of yours was the

first begotten on earth. Two poles that cross each other at their ends, two behind and one stuck diagonally above in forest fashion is and remains, as you may any day see for yourself in the huts of the fields and the vineyard slopes, a far earlier discovery from which it is quite impossible for you to deduce a principle for your pig-stye." In other words Goethe seeks to prove that columns enclosed in walls placed in buildings whose essential object is that of mere enclosure have no meaning. This is not because he would not recognize the beauty of the column. On the contrary, he is loud in its praise. "But take good care," he adds, "not to employ them improperly: it is their nature to *stand up free.* Woe to the wretch who has soldered their slender growth in blockish walls." It is from such a point of view that he proceeds to consider the building art of the Middle Ages and our own time and affirms: "The column is of no value as a constituent feature of our dwellings: it rather contradicts the essence of all our buildings. Our houses do not consist of *four columns* in four corners; they consist of *four walls* on four sides, which stand *in the place of all columns*, totally exclude such, and where they are thrust in they are a burdensome superfluity. This applies to our palaces and churches, subject to one or two exceptions, which it is not necessary to particularize." We have in the above statement, which is the result of independent observation of the facts, the principle of the column correctly expressed. The column must place its foot down in front of the wall and appear in complete independence of it. In our more modern architecture no doubt we find pilasters freely used; architects, have, however, regarded them as the repeated adumbration of previous columns, and made them flat rather than round.

(*γγ*) From this it is clear that though no doubt walls may serve as support, yet, for the reason that the function of support is already independently performed by columns, they must, on their part in finished classical architecture be accepted as essentially having for their object the enclosure.

If they are taken as columns are taken, to provide means of support, the essentially distinct defining functions of these latter are not, as is most desirable, performed also as by distinct constituent parts of the building[90], and the conception of what walls ought to provide is impaired and confused. We consequently find even in temples that the central hall, where the statue of the god was placed, to enclose which was the main object, is often left open in the upper part. If, however, a roofing is required, the claims of the lofty style of beauty made it necessary that the same should be supported independently. In other words the direct imposition of entablature and roof on the enclosing walls is purely a matter of necessity and need; it is not appertinent to free architectural beauty, because in the art of classical buildings we require as means of support neither partitions nor walls, which would be rather derogatory to the design in so far as — we have already noticed the fact — they put together contrivances and a wall-space of greater extent than is actually necessary.

These would be the main distinguishing features which in classical architecture we have to keep apart.

(*c*) Although we may then, on the one hand, declare it as a principle of first importance that the distinctions which have been summarily indicated must appear with their *differences* emphasized, it is equally necessary on the other that they should be *united in a whole.* We will shortly, in conclusion, draw attention to this union which in architecture will be rather and simply a juxtaposition, association, and a thorough eurhythmy of the entire construction. Generally speaking the Greek temple buildings present an aspect which both satisfies, and if we may use the expression, sates us to the full.

(*α*) There is no soaring up, but the whole just expands on the broad level and is extended without particular elevation. In order to view the building's face it is barely necessary to raise the sight with intention; it is, on the

contrary, allured to the bare expanse, while the building art of Germany in the Middle Ages strives up almost without mass and soars. Among the ancients breadth, regarded as secure and convenient foundation on the earth, is the main thing. Height is rather borrowed from the height of man, and merely is increased in proportion as the building increases in breadth and width.

(*β*) Furthermore, embellishments are so effected that they do not impair the impression of simplicity. For much also depends on the mode of decoration. The ancients, more particularly the Greeks, preserve here the finest sense of proportion. Extensive surfaces and lines of entire simplicity, for instance, do not appear so large in this undivided simplicity as in the case where some variety, somewhat that destroys this uniformity is introduced, by which at once an extension of more definite outline is presented to the vision. If this subdivision, however, and its adornment is wholly elaborated in detail, so that we have nothing before us but a variety and its details, even the most imposing relations and dimensions appear to be crumbled away and destroyed. The ancients, therefore, as a rule are actuated in their works neither to let the same and their proportions by such means appear in any way greater than they actually are, nor do they break up the whole by means of interruptions and embellishments to the extent that — because all parts are small and a unity is absent which shall once more bring everything together and fuse it throughout — therefore the whole also shall appear as insignificant. To quite as little an extent are their works of beauty in their perfection merely piled up as mere weight on the ground, or tower up out of all relation to their breadth to the skies. They preserve in this respect, too, the mean of beauty, and offer at the same time in their simplicity necessary scope to a duly proportioned variety. Above all, however, the dominant feature of the whole and its simple particularities appear to permeate in the most transparent way through all and everything,

and overmasters the individuality of the configuration precisely in the way that in the classical Ideal the universal substance retains its power to control what is accidental and particular, in which the same receives its living form, and to bring it into harmony with itself.

(*γ*) With regard to the disposition and articulation of the several parts of a temple we find, on the one hand, a very marked graduation of elaboration, and on the other much that is purely traditional. The main distinctions that have an interest for us in this inquiry are limited to the temple precinct (ναὸς), enclosed by walls containing the image of the god, also the dwelling in front (πρόναος), that in the rear (ὀπισθόδομος), and the colonnades that encircle the entire structure. A dwelling in front and behind with a series of columns before it had originally the typical form, which Vitruvius calls ἀμφιπρόστυλος; to this was afterwards added a row on either side of the building, that is the περίπτερος; finally we have the completest form of elaboration in the δίπτερος, where this row of columns is doubled throughout the circuit, and in the ὕπαιθρος colonnades detached from the walls, and which it is possible to pass round, as in the case of the colonnades above, are added in double rows with the interior of the ναὸς itself. For such a type of temple Vitruvius instances as an example the eight-columned temple of Minerva at Athens, and the ten-columned one of Olympian Jupiter[91].

We will pass over in this place the more detailed consideration of the number of columns no less than the nature of the intervening spaces between themselves and the walls, and merely draw attention to the unique significance which such colonnades and forecourts, or halls possessed in general for the Greek temple. In these prostyles and amphiprostyles, that is, these single and double colonnades, which brought you direct into the open sunshine, we observe that men can move about openly and free and can group themselves as they choose, or according to the chance of the moment.

Columns are, in short, not an enclosure, but a limitation through which you can always pass, so that you can be partially within and without them at once, and at any rate can everywhere step from them into the open day. In the same way the long walls at the back of the columns do not permit of any pressure to one central point, whither our sight may instinctively turn when the passages are crowded. On the contrary the eye is rather diverted from such a point of unity in every direction; and instead of the conception of a congregation brought together for One purpose we observe a tendency outwards, and merely receive the impression of a means of spending the time devoid of seriousness, light-hearted, idle, and provocative of chatter. Within the enclosure no doubt we have suggested a profounder aim, but even here we find surrounding features[92], which more or less indicate that we are not to take such a purpose too seriously. Consequently the impression of such a temple, though no doubt simple and imposing, is at the same time gay, open, and pleasing to the sense; the entire building, in short, is rather arranged as a place for standing about in, strolling round, for ingress and egress than in order to enable an assembly of persons to concentrate their numbers in one spot shut off from the rest of the world.

3. THE DIFFERENT CONSTRUCTIVE TYPES OF CLASSICAL ARCHITECTURE

Casting our glance now on the different forms of construction which offer us the predominant examples of distinctive type in classical architecture we may emphasize the following as most important.

(*a*) What first arrests our attention in this field are those kinds of building whose lines of distinction are most noticeable in their *columns*; for this reason I shall myself, too, limit myself to a statement of the pre-eminently characteristic traits of the various types of column.

The most famous among the orders of columns are the *Doric*, *Ionic*, and *Corinthian*, over whose architectural beauty and adaptation to definite purpose, neither the research of earlier times nor our own has been able to add anything. For we may assume that the Tuscan, or, according to Hirt[93], the ancient Greek type of building belongs in its undecorative crudeness to the original and simple type of wood structure, not to the architecture of beauty, and the so-called Roman order of columns is of no real moment, being merely an increase in the decorative character of the Corinthian. The important points in this inquiry are the relation of the height of columns to their thickness, the type of base and capital to be distinguished in each case, and, finally, the greater or less intervening spaces between the columns. With regard to the first, if the column is not of a height four times as large as its diameter it appears too bulky and depressed; if its height, however, exceeds such a proportion by being ten times as large, the column will appear too slender to the eye, and too slim as a means of support. The respective intervals between the columns must, however, be considered in close relation to the above facts; if the columns appear more stout they should be placed nearer to one another, if on the contrary the impression they produce is one of slightness and lankness the intervals have to be larger. It is a matter of equal importance, and this is so whether the columns have a pedestal or not, whether the capital is of higher or less ample size, is without or with decoration, for it is by this means that the entire character of the column is altered. With regard to the column's shaft, however, the rule obtains that it should be smooth and devoid of decoration, although it does not rise throughout of the same thickness, but is appreciably more slender at the top than it is midway and at the base, and the change is such that there is a swelling which, though barely perceptible, is none the less present. In more recent times no doubt, notably in the Middle Ages, when the antique types of columns were converted to the use of Christian architecture, the

smoothness of shaft was found to be too cold, and for this reason wreaths of flowers were entwined round them, or columns of spiral form were permitted no doubt on similar grounds; this, however, is inadmissible and opposed to the best taste, because the true function of the column is simply that of support, and to carry this out they ought to rise in a secure and straight line and be self-subsistent[94]. The only divergency from the rule in columnar structure which the ancients admitted was that of the groove, a variation which, as Vitruvius points out, made such appear broader than when their surface is wholly smooth. Such grooving we find carried out very extensively.

I will now indicate more closely the main distinguishing features of the Doric, Ionian, and Corinthian order of columns respectively.

(α) In primitive buildings *security* of structure is the fundamental characteristic beyond which architecture fails to go; consequently it does not as yet dare to risk relations of a slender kind with the bolder lightness which belongs to them, but rests satisfied with forms of greater bulk. This is the case in the Doric type of building. We find here that the material aspect with its onerous weight still is that which is most influential, and is particularly apparent in the relations of breadth and height. When a building is erected in lightness and freedom the burden of heavy masses is overcome; if on the contrary its disposition is one which suggests mainly breadth and a low elevation the prevailing impression, as in the Doric style, is that of stability and solidity, subservient to the dominant force of gravity.

Consistently with this character Doric columns, if contrasted with the other two orders, are the broadest and lowest. The more ancient examples do not rise above a height which is six times their diameter, and not unfrequently they are merely four times that breadth; for this reason they give, by virtue of their unwieldiness, the impression of an earnest, simple, and unadorned manliness, such as we have exemplified in the temples at

Paestum and Corinth. The later examples of the Doric order, however, extend their columns to a height of seven times this unit of measure, and, for buildings other than temples, Vitruvius adds yet another half diameter. More generally, however, the distinctive character of the Doric type consists in this that it approximates most nearly to the primitive simplicity of the wood building, although it is more receptive than the Tuscan to decorative work and embellishments. The columns, however, have almost without exception no distinctive base; they stand up directly on their foundation[95], and their capitals are arranged in the simplest way out of ovolo ornament and plinth. The shaft is sometimes left smooth, sometimes grooved with twenty drills, which frequently were flat for one third of the way from the base, and hollowed out in circular form the rest of the way[96]. As regards the interval between the columns, according to the older monuments, the breadth is twice the diameter of a column, and only a few exceed this by a width between two and two and a half diameters. Another peculiarity of the Doric type of building in which it approaches the type of wood construction consists in triglyphs and metopes. In other words triglyphs indicate in the frieze the tops of the beams of the entablature with which the architrave culminates inserted there by means of prismatical incisions[97], while the metopes fill up the spaces between one beam and another, and in the Doric construction still retain the form of the square[98]. As a decoration they are frequently covered with reliefs, while beneath the triglyphs, which rest on the architrave, and as a culmination to the surfaces of the cornice on their lower side, we have for embellishment six small conical bodies, technically known as drops.

(*β*) In the Doric style we are already made aware of an advance in the characteristics of a solidity which affects us with pleasure. In Ionic architecture this upward progress is further emphasized in a type notable for its slenderness, charm, and grace, if still expressed in a simple way. The

height of the columns varies between that of seven and ten times the width of the diameter at the base, and is determined, according to the conclusions of Vitruvius, pre-eminently by the breadth of the intervening spaces of the columns, that is to say, where they are wider the columns appear thinner, and consequently more slender, where they are more narrow, however, they appear stouter and of less height. For this reason the architect is forced, in order to avoid an excess of thinness or bulk, in the first case to reduce the height, and in the second to increase it. In the case, then, where the intervals exceed three diameters the height of the columns will merely carry eight of such, where there is an interval of two and a quarter rising to three, the height will rise to eight and a half diameters. If the columns, however, are separated only by the width of two diameters, the height must be extended to nine and a half times the unit, and in the extreme case of an interval of but one and a half times, such height will even rise to ten times the breadth of diameter. However, cases such as these latter ones appear very seldom, and, in so far as we may judge from such monuments of the Ionic type of building that have come down to us, the ancients made very scanty use of those relations which necessitated the more lofty columns.

The Ionic type is further distinguished from the Doric in this that the Ionic columns do not rise directly with their shaft from the substructure, but are set up on a variously articulated pedestal, and then in unobtrusive rejuvenescence rise lightly in their slender height to their capitals with a deeper hollowing out than in the Doric type, a broad grooving of four and twenty grooves. It is especially in this characteristic that the Ionic temple at Ephesus is distinguishable from and in contrast to the Doric at Paestum. In the same way we find an increase of variety and grace in the Ionic capital. It has not only a carved coussinet[99], little ledge and plinth, but receives both to the right and left a spiral winding, and at the sides a decorative kind of cushion, from which is derived its title of the pulvinated capital. The volutes

at the end of the pad or cushion indicate the end of the column, which, however, may rise to a still greater elevation, but in this possible increase makes itself essentially a curve.

Compatibly with this slender character of the pleasing decoration of its columns the Ionic type of building requires a less bulky weight in its beams, and is concerned in this way too to secure an increase of grace. By doing so it no longer suggests as a predecessor as the Doric does the wood construction, and consequently suffers triglyphs and metopes to fall away in the flat frieze, introducing in their place as its principal means of decoration, heads of sacrificial animals united with flowery coils, and, instead of the suspended mutule[100] tops, we find tooth-like ornamentation[101].

(*γ*) Finally, to come to the *Corinthian* order, we find it is in fundamentals composed upon the Ionic, only that with a similar slenderness it is elaborated in more tasteful luxuriance, and unfolds the consummate finish of adornment and embellishment. Like it content to possess the definite and various divisions of its structure as a legacy from the wood building, it emphasizes the same without permitting their origin to be conspicuous by means of its decorative work, and expresses, in its manifold ledges and borders on cornice and beam, on its weather moulds, its moulding flutes, its variously articulated pediments and its more luxuriant capitals, a multiplicity of pleasing features.

The Corinthian column, it is true, does not exceed in height the Ionic, rising as a rule with a grooving of similar character, merely eight times or eight and a half times as high as the diameter of the lower portion of the column, but it appears more slender and above all more exuberant by virtue of a loftier capital. For the capital's height is one and an eighth times the diameter beneath, and has at each of its four corners more slender volutes which suffer the pulvination of the previous type to fall off, while the part

below is decorated with acanthus leaves. The Greeks have a charming tale relative to this. A maiden of exceptional beauty, they tell us, died. Her nurse collected her playthings in a little basket and placed it on her grave, where an acanthus plant sprang up. The leaves very soon embraced the basket, and it was this which suggested the thought of the capital of a column.

Of other points of difference between the Corinthian and the Ionic and Doric orders, I will only further mention the delicately curved mutules under the cornices, and the projection of the water moulding, and the indentations and corbel-heads on the cornice[102].

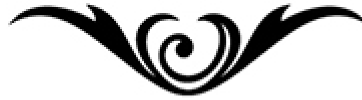
(*b*) We may, *secondly*, regard the *Roman* type of building as an intermediate form standing between that of Greek and Christian architecture, in so far as here we find mainly the application of arch and vaultings. It is not possible to determine with accuracy the time when the construction of arches was first discovered; it appears, however, certain that neither the Egyptians, despite the great progress they made in the arts of building, nor the Babylonians, Israelites, and Phoenicians were cognisant of the *ogive* or the *vault.* The monuments of Egyptian architecture at any rate only show us that when it was a question of superimposing a roof over the interior of a building the one means the Egyptians had at their disposal was that of placing huge slabs of stone across like beams in horizontal position. If it was required to arch up broad entrances, or cross arches they knew of no other way of doing this than letting one stone on either side project forward, with another still more projecting one above it, so that the side walls gradually approached upwards until they reached a point where only one stone was necessary to close the remaining space between. Where such an expedient was not necessary they covered the spaces with huge slabs of stone arranged across in the manner of rafters.

Among the Greeks we do, I believe, find monuments in which the arch construction has already been adopted, but they are rare; and Hirt, who has written with most authority over the building and the history of the building of antiquity, affirms that among such monuments we can rely on none with security as dating from a time previous to that of Pericles. In other words, in Greek architecture the features which are characteristic and elaborated are the column and beam in horizontal position, so that we find here the column very little used in a relation which lies apart from its true function, namely that of supporting beams. Moreover the arch that is vaulted from two piers or columns, and the knob-like formation, connotes a yet further feature, for we find here that the column already begins to forsake its determinate attribute of support. For the circular arch in its rise, its flexure and its declivity is related to a centre which has nothing to do with the column as a means of support. The separate parts of the circular arch are carried in mutual opposition; they support and prolong each other in a way that shows them far more remote from the direct assistance of the column than is the horizontally superimposed beam.

In *Roman* architecture, then, as stated, the arch-construction and vaulting is of very common occurrence, or rather we have certain remains which we can only attribute to the age of the Roman kings, if we may fully believe the evidence of later times. Of this type are the catacombs and cloaca, which were vaulted, but must be regarded as works of a more recent restoration. The most probable discoverer yet suggested of the vault is Democritus[103], who occupied himself in a variety of ways with mathematical problems and is held to be the discoverer of lithotomy.

One of the most famous buildings of Roman architecture, in which the circular arch appears as fundamental type is the Pantheon of Agrippa dedicated to Jupiter Ultor, which, in addition to the statue of Jupiter, contained colossal images of gods in no less than six other niches, namely,

Mars, Venus, the deified Julius Caesar as well as three others whose identity we cannot fix with accuracy. In either side of these niches stood two Corinthian columns, and the whole was vaulted with one majestic vault in form of the half globe and corresponding to the vault of heaven. With reference to the material of this vault we may note that it is not a stone one. In other words the Romans, in the majority of their vaultings, in the first instance carried out a construction of wood, and covered the same with a composition of chalk and puzzolana cement, which was made of the dust of a light kind of tufa and broken tile shards. When this composition was dry the whole was formed into a mass so that the wooden scaffolding could be removed and the vaulting, by virtue of the lightness of its material and the stability of its consolidation, exercised only an insignificant pressure on the walls.



(*c*) The architecture of the Romans possessed moreover generally, and apart from this novel employment of arch construction, an entirely different scope and character than that of Greece. The Greeks distinguished themselves, while carrying throughout their work its main purpose, and by virtue of their perfection as artists, in the nobility, the simplicity no less than the airy delicacy of their decorations. The Romans on the contrary are, as artists, at least on the mechanical side of construction more rich and more ostentatious, but at the same time of less nobility and grace. Add to this in their architecture we meet with a variety of intention which was unknown to the Greek. As I have already observed the Greeks entirely devoted the splendour and beauty of art to public objects. Their private dwellings remained insignificant. Among the Romans, however, not only do we find an increase of public buildings, whose main purpose of construction was splendidly embellished in theatres, spaces for animal combats and other means of public sport, but architecture received a deliberate impulse in the direction of private use. More especially after the civil wars villas, baths,

colonnades, flights of steps were constructed with the imposing character of the most luxurious extravagance, and by this means a new opening was made for the arts of building, which also included that of gardening, which was perfected in a way that evinced very considerable talent and taste. The villa of Lucullus is a striking example.

This type of Roman architecture has in many respects rendered service as a model to Italians and Frenchmen of t more recent times. Among ourselves we have for a long time to some measure followed in the steps of the Italians, and also to some extent in those of the French; finally men have once more devoted their attention to the Greeks, and have accepted as an object of imitation the antique in its purer form.

CHAPTER III

ROMANTIC ARCHITECTURE

THE GOTHIC ARCHITECTURE of the Middle Ages, which constitutes here the characteristic centre of the truly romantic type, has for a long time, more especially since the popularization and predominance of the French taste, been regarded as something rude and barbarous. In recent times it was Goethe who mainly, in the first instance, and in the youthful freshness of his own nature and artistic outlook, brought once more the Gothic type to its place of honour. Critical taste has been more and more concerned to appreciate and respect these imposing works as giving effective expression both to the distinctive purpose of Christian culture, and the harmonious unity thereby created between architectonic form and the ideal spirit of Christendom.

1. GENERAL CHARACTER

In so far as the general character of these buildings is concerned, in which religious architecture is that which is most prominent, we discovered already in our introduction to this part of our inquiry that in this type both those of *independent* and *serviceable* architecture are *united.* This unity, however, does not in any way consist in a fusion of the architectural forms of the Oriental and the Greek, but we must look for it in the fact that, on the one hand, the house or *dwelling-enclosure* furnishes yet more the fundamental type than in the Greek temple construction, and, on the other, mere *serviceableness* and purpose is to that extent *eliminated*, and the house is emphasized apart from it in its *free independence.* No doubt these houses

of God and other buildings of this type appear to the fullest extent as constructed for definite objects, as already stated, but their true character is precisely this, that it reaches over and beyond the determinate aim and presents itself in a form of self-seclusion and positive local independence. The creation stands up in its place independent, secure, and eternal. For this reason the character of the entirety is no longer to be deduced from any purely scientific or theoretical relation. Within the interior the box-like envelope of our Protestant churches falls away which are built simply that they may be filled with men and women, and do not possess church pews as stalls; in their exterior, the building soars in its roofing and pinnacles freely upwards, so that the relation of purpose, however much it be also present, tends again to disappear, leaving the impression of the whole that of a self-subsistent existence. Such a building is entirely filled up by nothing expressly; everything is absorbed in the grandeur of the whole: it possesses and declares a definite object, but in its grandiose proportions and sublime repose it is essentially and with an infinite significance exalted[104] above all mere intentional serviceableness. This exaltation over finitude and simple security is that which constitutes the *unique* characteristic aspect of it. From another point of view it is precisely in this type that architecture finds the greatest opportunity for *particularisation*, diversion of effect and variety, without permitting, however, the whole to fall into mere details and accidental particulars. The imposing character of the art we are considering restores, on the contrary, this aspect of division and dismemberment in the original impression of simplicity. It is the substantive being of the whole which is set in division and dismemberment in an infinite multiplicity throughout the entire complexus of individual and varied distinctions; but this unbounded complexity is subdivided in a simple way, is articulated according to rule, broken into parts symmetrically by the same substance, which is the motive and constitutive principle throughout in a harmonious

co-ordination which entirely satisfies, and which combines without let or hindrance the mass of detail in all their length and breadth in securest unity and most perspicuous independence.

2. PARTICULAR ARCHITECTURAL MODES OF CONFORMATION

If we pass now to a consideration of the particular forms in which romantic architecture receives its specific character we shall find, as we have already above noticed, that our entire discussion will be confined to what is genuine Gothic architecture, and mainly that of the church buildings of Christendom, in their contrast to the Greek temple.

(*a*) As fundamental form underlying all the rest, we have here the *wholly shut off dwelling-house.*

(*α*) In other words, just as the Christian spirit withdraws itself within an ideal realm, the building is the place essentially delimited on all sides for the congregation of the Christian community and the gathering together of spiritual life. It is the concentration of essential soul-life which thus encloses itself in spatial relations. The devotion of the Christian heart, however, is at the same time and in the same degree an exaltation over finitude, so that this exaltation, moreover, determines the character of God's house. Architecture secures thereby as its significance, independently of the object which renders it necessary as a building, this exaltation to the Infinite, a significance which it is forced to express through the spatial relations of architectural forms. The impression, therefore, which art is now called upon to emphasize is, in one aspect of it, and in contrast to the open gaiety of the Greek temple, that of the tranquillity of the soul which, released from external nature and worldly conditions, retires wholly into self-seclusion; in the other aspect of it it is that impress of a solemn sublimity, which strains and soars over and beyond all rational limits. If,

therefore, the buildings of classical architecture as a rule offer the expansion of breadth, we find in contrast to this that the romantic character of Christian churches asserts itself in the growth upwards from the soil and a soaring to the skies.

(*β*) In this oblivion of external Nature and all the diverting occupations and interests of finite existence, which is to be effected by means of such seclusion, the open forecourts and colonnades and the like, which are in direct communication with that world, furthermore and of necessity fall away, or only receive an entirely modified representation within the interior of the building. And in like manner the light of the sun is either excluded, or glimmers in broken rays through windows of painted glass, which, to prevent total immersion in darkness, are perforce admitted. What humanity needs here is not the gift of external Nature, but a world created through it and for it alone, for its devotion and the activity of its soul-life.

(*γ*) We may fix as the pervading type by which the house of God is generally and with particular reference to its sections characterized that of the free rise and running up into *pinnacles*, whether they be built up by means of the arch or straight lines. In classical architecture, where we find columns and piers with superimposed beams is the fundamental form, rectangularity and the office of support is the feature of importance. For the construction superimposed at right angles marks in a definite way that it is supported. And even though the beams do in their turn carry the roofing, the surfaces of this latter portion incline to one another in an obtuse angle. In such a construction we find no trace of a genuine tendency to points and a soaring up: we find simply repose and support. In the same way, too, a circular arch, which extends in a continuous and equally gradated incline from one column to another, and is referable to one and the same centre, rests on its substructure of support. In romantic architecture, however, we no longer find the relation of support simply and rectangularity the

fundamental form, but rather we have before us the fact that all that is enclosed either on its interior or exterior side independently springs upward, and, without the secure and express distinction between the relationship of weight and support, concentrates in a point. This pre-eminently free striving upwards and tendency to inclines that run to culminating points is what constitutes here the essential determinant, by virtue of which either acute-angled triangles with a more slender or broader base or pointed arches appear, both of which aspects stand out most obviously in the characterization of Gothic architecture.

(*b*) Moreover, the obligations of spiritual devotion and exaltation, regarded as a cultus, bring before us a variety of definite conditions and features which cannot be fully met on the exterior of the building in the open halls or forecourts of a temple, but can only be satisfied within the house of God itself. If, therefore, in the case of the temple of classical architecture it is the external form which is of most importance, and we find it remaining by means of the colonnades more independent of the interior construction, romantic architecture presents a contrast to this not merely in the fact that the interior of the building is more essentially important, for the reason that the whole purports to be simply an enclosure, but also in this, that the interior permeates the very form of the exterior throughout, and determines its specific shape and mode of articulation.

In this connection we will, in order to examine the matter more closely, first make an entrance into the interior, and working outwards therefrom endeavour to elucidate the exterior.

(*α*) The definition I have already adduced as best describing the *interior* of the church is that of a certain place set apart and enclosed in all its aspects, whether it be in opposition to the inclemency of the weather or the distractions of the outer world, for the community and its spiritual worship. The space of the interior is consequently an enclosure in the completest

sense, whereas Greek temples, apart from the presence of open passages and halls in the environment, not unfrequently possessed open cells.

Inasmuch as, moreover, Christian worship is an *exaltation* of the soul above the limitations of natural existence and a reconciliation of the individual with God, we find in this fact a mediation of points of view which are separably *distinct* in one and the same essentially concrete unity. At the same time romantic architecture receives the function in the form and co-ordination of its building to make the above content of spiritual life, to enclose which is the prime object of its construction, so far as this is architecturally feasible, shine through and determine the actual shape both of the exterior and the interior. The following points will assist our understanding of the nature of this problem.

(*αα*) The space of the interior will have to be no abstractly undifferentiated and empty one, which possesses no essentially defined features or links that relate them respectively. It must have a concrete form, one, that is, which presents differences in respect to all the mutual relations of length, breadth, height, and the mode of such dimensions. The form of the circle, the square, the oblong, with the equality of enclosing walls and roofing which is necessary to these figures, will not be suitable here. The movement, severation, and mediation of soul-life in its exaltation from that which is of earth to that which is eternal, to the far-off and the more lofty, would fail to find apt expression in this bare equality of a square figure.

(*ββ*) It is only a corollary to this that in the Gothic style the substantial *purport* of the house, both in respect of its enclosing form of sidewalls and roof, and in that of its columns and beams relatively to the *configuration* of the whole and its parts, becomes a matter of subordinate importance. And with this disappears, on the one hand, as we have already noticed, the strict distinction between burden and support, as on the other we find no longer rectangularity is emphasized as essential to the building’s purpose.

Recourse is made once more to an analogous form of Nature, namely, one that prefigures a solemn place of assemblage and enclosure which freely soars upwards. If we step into the interior of a cathedral of the Middle Ages we have brought before us not so much the stability and mechanical purpose of supporting piers and a vault that rests upon it. We are rather reminded of the arches of a forest, whose rows of trees incline with their branches to one another and form an enclosure by this means. A cross-beam requires a secure centre of gravity and the horizontal position. In Gothic architecture, however, the walls mount up freely and independently, and in the same way the piers, which then expand above in several directions apart from one another, and coalesce as though by accident. In other words their function, to support the vaulting, is, although the same in truth reposes on the piers, not expressly emphasized and independently set forth[105]. The effect is as though they did not carry such, just as in the tree the branches do not appear as though supported by the stem, but rather in their airy incurvation as a continuation of the stem, and with the branches of other trees, form a roof of leaves. A roofing of this kind, which is thus fixed upon as the cover of the life of Spirit, this awful environment, which invites us to contemplation, it is which the cathedral presents us, in so far as the walls and among them the forest of piers freely coalesce in their summits. But for all that we do not actually assert that Gothic architecture has accepted trees and woods for the actual exemplar of its forms.

While the sharpening to a point offers us generally the basic type in Gothic we find in the interior of churches this tendency take the more specialized shape of the *pointed arch.* By this means the *columns* in particular receive an entirely fresh significance and appearance.

The broad Gothic churches require a roofing to close them in, a roofing which on account of the breadth is a severe burden and renders support unavoidable. Here, therefore, the columns appear to be in their right place.

For the reason, however, that the straining upwards is precisely that which converts support into the appearance of free soaring-up columns are unable to be employed here with the significance they possess in classical architecture. They become, on the contrary, piers which, in lieu of the cross-beam, carry arches in a manner whereby they appear as simply a continuation of the pier and coalesce together without definite object in a point. We may, no doubt, conceive the unavoidable termination of two piers that stand apart from one another as analogous to a gut-roof that rests on corner posts; but taking into consideration the surfaces at the sides, although they, too, are planted on piers in entirely obtuse angles, and incline to one another in an acute angle, we find in the latter case none the less the conception on the one hand of burden, and on the other of support. The pointed arch, on the contrary, which apparently in the first instance mounts up in a straight line, and only by imperceptible and slower degrees leans forward in order to incline to the opposite side, presents for the first time the complete idea as though it was just nothing but the continuation of the pier itself, which forms an arch with another. Piers and vaulting appear, in their contrast to columns and the beam, as one and the same image, although the arches rest upon the capitals from which they spring. The capitals, too, in specific cases, such as occur in Netherland churches, keep away altogether, and by this means the inseparable unity above-mentioned is made expressly visible to the eye.

Moreover, on account of the fact that this striving upwards is declared as the fundamental character, the height of the piers exceeds that of the breadth of their base in a proportion that we cannot calculate at sight. The piers are thin, slender, and soar up so high the sight is unable to take in the entire form at a glance, and is compelled to rove about in its upward flight until it attains repose at last in the gently inclined vaulting of the uniting arch,

much as the soul moving with restlessness in its devotion from the ground of finitude uplifts itself and finds rest in God alone.

The final point of distinction between piers and columns consists in this, that the piers which are distinctively Gothic, and, where they are elaborated in their specific character, do not, as columns do, remain in the circular form, essentially secure in that, and one and the same cylinder, but to begin with at their base in a reed-like way constitute a convolute, a bundle of fibres, which break into varied distinction as the pier mounts and radiate forth on all sides under various modes of continuation. And, while we find already in classical architecture that the column represents an advance from that which is merely subject to laws of gravity, from the solid and simple to that which is more slender and more adorned, so, too, we find much the same change visible in the pier, which, in this more slender upgrowth, ever withdraws itself more from the mere service of support, and freely soars upward albeit shut in at its summit.

The same form of piers and pointed arches is repeated in windows and doors. More particularly the windows, not merely the lower ones of the side aisles, but also in a still higher degree, the upper ones of the transepts and choir, are of colossal size in order that the glance, which rests upon their lower portion, may not at once take in the upper part as well and may be uplifted as in the case of the vaultings. This adds to the restless motion of the upward flight which it is intended to communicate to the spectator. Add to this the window panes, as we have already remarked, are with their coloured glass only partially transparent. Sometimes they present sacred histories and sometimes they are merely panes of varied colour with the object of increasing the twilight effect and permitting the light of the wax candles to shine forth. For in these buildings it is another daylight than that of Nature which illumines.

(*γγ*) Finally, as regards the *entire articulation* of the interior of Gothic churches we have already seen that it is imperative that the particular parts of such should be differentiated in their breadth, height, and length. The primary distinction to consider in this respect is that of *choir, transept*, and *nave* from the *encircling aisles.* These latter are constructed on the sides external to the fabric by means of walls which enclose it, and from which piers and arches are carried, and in their separation from the interior by means of piers and pointed arches, which present openings toward the nave, having no partition walls between. They receive therefore the converse aspect to that of the colonnades in Greek temples, which are open on the outside and are enclosed towards the interior, whereas the aisles in Gothic churches permit free passage between the piers to the nave. In certain examples we find two such aisles in juxtaposition; in fact, Antwerp cathedral is an example which possesses three of them at either side of the nave.

The *nave* itself soars up by means of enclosing walls on either side, at different degrees of elevation, according to various modes of disposition, above the aisles, broken by colossal windows in such a way that the walls themselves at the same time have the appearance of being slender piers, which everywhere separate in pointed arches and build up vaultings. There are, however, churches in which the side aisles have the same height as the nave, as, for example, in the later choirs of the Sebaldus Church in Nuremberg, which offers the impression of an imposing, free, and capacious type of slenderness and delicacy. In this way the whole is divided by means of rows of piers, which are brought together at their summits like a forest in flights of branching arches. Attempts have been made to discover in the *number* of these piers, and generally in the relations of number much *mystical* significance. There can be no question but that at the period of the finest efflorescence of Gothic architecture, that, for example, of Cologne

Cathedral, a great significance was attached to the symbols of number, the as yet more gloomy presentiment of what is rational falling in readily with an insistence on external traits of this kind. But despite this fact the artistic productions of architecture, which are carried through by means of that which is always to a greater or less degree merely the capricious play of a symbolism of subordinate rank, is neither of the profoundest significance, nor of the most exalted form of beauty, for the reason that the genuine spirit of these is expressed in entirely different forms and modes than those applicable to the significance of numeral distinctions. We must therefore be especially cautious not to carry such investigations too far. To attempt to go to the root of everything and in every direction to desire to discover a deeper meaning will tend quite as much to contract our horizon and destroy our thoroughness of search as is common with all short-sighted learning which passes over the depth which is clearly expressed and presented without grasping it. In respect to the more detailed distinction between *choir* and nave, I will in conclusion emphasize the following points. The high-altar, this real centre of the ritual, is placed in the choir, which is thus dedicated as the place for the priesthood as distinct from the community, whose proper place is that of the nave, where we find the pulpit for the preacher. A flight of steps, which varies in its height, conducts us to the choir, so that this latter section and all that takes place in it is visible everywhere. In the same way this choir section is relatively to decoration more ornate, and, moreover, in its distinction from the more prolonged nave, even where the vaultings in both cases are of equal height, is more serious, solemn, and sublime. Above all we find here that the entire building is finally enclosed with piers of greater thickness and more closely, by means of which the breadth tends to disappear, and the entire effect is one of greater stillness and height, whereas the transepts and the nave through their towers still provide with their means of entrance and exit a

connection with the outside world. According to the points of the compass the choir is placed to the east, the nave lies in a westerly direction, and the transepts stand towards the north and south. We find, however, churches with a double choir, in which the two choirs lie respectively in the direction of morning and evening and the main entrances are placed in the transepts. The stone font for baptism, that is, for the sanctification of human entry into the Christian community, is placed in a porch by the main *entrance* into the church. And, finally, we may note that, while the more express worship is provided for by the entire building, and notably the choir and nave, there are also small chapels which form in each case a fresh and independent church.

This must suffice as a description of the articulate structure of the whole. In a cathedral of this type there is space enough for an entire people. For here it is the intention that the community of a city and district do not congregate round the building, but within the same. And for this reason all the varied interests of life which in any way come into contact with religion have, too, a place assigned them. No fixed divisions of seats placed in rows divide and diminish the broad space, but everyone comes and departs in peace, engages for himself or takes a seat for immediate use, kneels down, offers his prayer and removes himself once more. If it is not the hour of high mass the most various things take place at the same time, and there is no confusion. In one portion a sermon is delivered, in another a sick man is brought in; between these points we may find a slow procession; at one spot, we have a baptism, at another a deceased person is carried through the church. Or we may find in one place a priest delivering mass or celebrating the marriage services and in every direction the people in broken groups kneel before altars and sacred images. All such things are embraced by one and the same building. But this very variety and individualization disappears, nevertheless, with its alternations when contrasted with the

expanse and size of the building. Nothing completely fills up the whole, every incident passes by; individuals with all that they do are lost and dispersed as points in this grandiose whole. What happens at a given time is merely visible in its passing flight, and over and above all the huge and almost measureless spaces soar up in their secure and immutable form and construction.

Such, then, are the fundamental characteristics of the interior of Gothic churches. We must not look here for any definite purpose as such, but rather an object for the private devotion of the soul in its self-absorption in every detail of the spiritual life[106], and its elevation over all that is isolated and finite. For this reason these buildings are cut off from Nature by spaces enclosed on all sides, built up in the atmosphere of gloom and at the same time to the smallest detail in a spirit that strives upwards sublime and immeasurable.

(*β*) If we direct our attention now to the *external* aspect we shall find, as we have already above observed, that in contrast to the Greek temple the exterior configuration in Gothic architecture, the decoration and co-ordination of the walls and all else is determined from within outwards, the exterior having to appear simply as an enclosure of the interior.

In this connection we have good reason to emphasize the following points:

(*αα*) In the *first* place in the form of the *cross* which we find dominates the whole exterior we cannot fail to recognize in outline a similar construction as that which obtains within, a form which cuts, the nave and choir in two, and supplies, moreover, the distinctions of height which obtain between the aisles, the nave and choir.

On closer inspection we find that the *principal façade*, as the external form of the aisles and nave, corresponds in the *portals* to the particular construction within. A more lofty principal door, by which we pass direct

into the nave, stands between the smaller entrances into the aisles, and suggests by means of the contraction in perspective that the exterior must draw together, grow more narrow, and disappear in order than an entrance may be thereby provided. The interior is the background already visible, into the depths of which the exterior is carried, just as the soul is constrained to grow more profound as ideality when it enters its own intrinsic wealth. Over the doors at the sides extend in the most direct connection with the interior colossal windows, just as the portals rise up to similar pointed arches, in a way similar to that in which they are employed as the particular form for the vaultings of the interior. Between these doors over the principal portal a large circular window branches out, the rose-window, a form which is, we may add, the exclusive and peculiar possession of this type of building, and only fitted to it. Where such rose-windows are absent we find substituted for them a still more colossal window with pointed arches. The façades of the transepts are divided in a similar way while the walls of the nave, the choir, and the aisles in their windows and their form, no less than in the position of the solid walls between, repeat in all respects the form of the interior and set the same forth on the outside.

(*ββ*) In the *second* place, however, the exterior begins to make itself at the same time intelligible to itself[107] in this close association with the form and subdivision of the interior for the very reason that it has its own peculiar tasks to fulfil. In this connection we may mention the *flying buttresses*. They represent the position of the many piers within the building and are necessary as points of support for the elevation and security of the whole. At the same time they further make apparent on the outside, so far as interval, number, and other features are concerned, the rows of piers on the inside, albeit they do not exactly reproduce the shape of the interior piers,

but the higher they mount up become reduced in the strength of their springing buttresses.

(*γγ*) Inasmuch as, however, in the *third* place, it is only the interior which has to be one essentially complete enclosure, this feature is lost in the form of the exterior and makes way in every respect for the all-prevailing characteristics of continuous elevation. And for this reason the exterior receives at the same time a form independent of the interior, which asserts itself mainly in a tendency to strive upwards on all sides into points and pinnacles, breaking out in them one on the top of another. To this fundamental feature belong the lofty uplifted triangles which, independently of the pointed arches, soar upwards over the portals, pre-eminently the principal façade, though also over the colossal windows of the nave and choir, and in a similar way the slenderly pointed shape of the roof, whose gable-end is especially prominent in the façades of the transepts. Add to these the flying buttresses, which everywhere terminate in little pointed pinnacles, and in this way, just as the rows of piers within the building create a forest of stems, branches, and vaultings, on their part on the exterior stretch up heavenwards a forest of points.

With most independence and most emphatically, however, it is the *towers* which rise upwards in their sublime summits. In other words we find that the entire mass of the building concentrates among other things itself in them, in order that thus in its main towers it may be without hindrance uplifted to an incalculable height without thereby losing its character of repose and stability. Such towers are either placed in the principal façade over the two side entrances, while a third and broader main tower springs up at the point where the vaulting of the transepts, choir, and nave meet, or one single tower constitutes the principal façade and is raised above the entire breadth of the nave. Such are at any rate the positions which are most usual. In direct connection with the worship such towers have belfries, that

is, to the extent that the ringing of bells properly applies to Christian services. This merely indefinite tone of the bell is a solemn stimulus of the soul-life, though in the first instance one that as yet prepares the worshipper only on the outside of the building. The articulate tone, on the other hand, wherein a definite content of feelings and ideas is expressed, is the song which is only to be heard within the church. The inarticulate clang of the bell finds its right place on the outside and only there and is sounded forth from the towers that its peal may pass forth as from some pure height far over the land.

(*c*) As to the mode of decoration I have already pointed to the main features of determinate character.

(*α*) The *first* point we have to emphasize is the importance of ornament generally for Gothic architecture. Classical architecture preserves as a rule a wise mean in the adornment of its constructions. Inasmuch as, however, it is the main interest of Gothic architecture to make the masses which it places in position appear larger and considerably more lofty than they in fact are it is not satisfied with plain surfaces, but subdivides the same throughout; and, moreover, breaks them up with forms which themselves suggest on their part a striving upwards. Piers, pointed arches, and triangles, which rise above them with their pinnacles, occur, too, as decorative work. In this way we find that the simple unity of the great masses is impaired, and the elaboration is carried to the point of every conceivable detail, leaving the entire effect, however, involved in the most flagrant contradiction. On the one hand we cannot fail to observe the most obvious outlines in a clearly defined co-ordination, on the other we have fulness and variety of delicate embellishment impossible to follow with the eye, so that the most motley particularity is directly set up in contrast to what is most universal and simple, just as the soul, in the opposition implied in Christian worship, is deeply engaged in finite things, and indeed carries its life into the mere

detail and the trifle. This very opposition acts as a stimulus to contemplation, this striving up invites to a like action. For what is of paramount importance in this style of decoration is this that it do not, by the mass and alternation of its ornament, destroy or cover up the fundamental outlines, but rather suffer them completely to make their way through such variety as the essential feature of importance. Only when it can do this, and I speak in particular of Gothic buildings, is the solemnity of their imposing seriousness kept intact. Just as religious devotion has to permeate all particular experiences of soul-life, the life-conditions of every type of humanity, has further to engrave indelibly on the heart its universal and incommutable ideas, so in the same way the simple and fundamental architectural features should have strength sufficient to recall the most varied articulation, diversity and embellishment of the structure once more within the fundamental impression of those outlines and wholly thus absorb them.

(*β*) A *further* aspect in decorative work is bound up in the same way with the romantic type of art in general. The romantic has on the one hand for its principle Ideality, the return of the Ideal to itself. On the other the Ideal has to re-appear in that which is external, and then withdraw itself into itself from the same. In architecture it is the sensuous, material mass in relations of Space, in which the most Ideal essence itself is, so far as that is possible, to be presented in visible shape. With a material such as this to deal with there is no other alternative possible than that of not suffering this material to assert itself with power in its materiality, but to break up and dismember its masses in every direction, and to wrest from the same the appearance of its immediate coherence and self-subsistency. In this connection the ornamentation, more particularly that of the exterior, which has not to display the fact of enclosure as such, assumes the character of a net-work[108] carried in every direction, or rather interwoven over the surfaces; and we

have no example of an architecture which, taking into account the enormous and heavily weighted masses of its stone and their secure coherence, nevertheless has preserved to such a complete extent the character of lightness and delicacy.

(*γ*) We have only further and *thirdly* to remark with reference to such embellishments that in addition to pointed arches, piers, and circles, the forms once more call to mind those of the real organic world. The fretwork and working out of the mass already carries a suggestion of this. Regarded in more detail, however, we actually find leaves, rosettes of flowers, and, in entwining work of an arabesque character, human figures and those of animals partly realistically and partly fantastically linked together; the romantic imagination, in short, even in architecture, displays its wealth of imaginative creation, and its power to unite in unexpected ways heterogeneous elements, although from another point of view, at any rate during the period of the purest type of Gothic architecture, even in the matter of ornament, as, for example, in the pointed arches of the windows, we may observe a decisive return to simple forms.

3. DIFFERENT TYPES OF BUILDING IN ROMANTIC ARCHITECTURE

The last point on which I have a few observations to make is that of the principal types followed by romantic architecture in its course of development at different periods. I must, however, add the premise that in this work no attempt can be made to supply a history of this branch of the art.

(*a*) We must wholly distinguish from Gothic architecture, such as I have above described it, the so-called pre-Gothic, whose development originated in Roman architecture. The most ancient form of Christian churches is that

of the *basilica.* These originated out of the public buildings of the Empire, huge oblong halls, with the frame-work of their roofing of wood, such as Constantine placed at the disposal of Christians. In buildings such as these there was a tribune, on which, during congregational religious services conducted by priests, there was singing and an address delivered, or merely reading aloud. The conception of the choir may have originated with this. In the same way Christian architecture accepted other of its forms such as the use of columns with circular arches, the rotunda and the modes of classical embellishment throughout, more particularly in the western Roman Empire, while in the eastern section it appears to have remained constant to this type until the time of Justinian. Even buildings erected by the Ostrogoths and Lombards in Italy retained essentially the fundamental Roman type. In the more recent architecture, however, of the Byzantine Empire several modifications made their appearance. A rotunda supported on four great piers forms the centre, to which different constructions were attached to meet the particular objects of Greek as distinct from the Roman ritual. We must not, however, confuse this genuine architecture of the Byzantine Empire with that which, in its general relation to architectural types, goes by the name of Byzantine, and which was employed in Italy, France, England, Germany, and other places up to the close of the twelfth century.

(*b*) In the thirteenth century was evolved the Gothic architecture in the distinctive form whose main characteristics I have above described in detail. It is nowadays denied that it is the work of Gothic architects, and the name given it is that of Deutsch or German architecture. We may, however, retain the more customary and ancient nomenclature. In other words we find in Spain very ancient indications of this type of construction, which suggest an association with historical circumstances under which Gothic kings, forced back into the mountains of Asturia and Galicia, retained their independence in such localities. Under such conditions, no doubt, a close

affiliation of Gothic and *Arab* architecture appears probable, yet both may be essentially distinguished. For the characteristic trait of Arab architecture in the Middle Ages is not the pointed arch, but the so-called *horseshoe* form. Moreover, these buildings, which are constructed for an entirely different ritual, exhibit an Oriental wealth and splendour, embellishments resembling plant-life and other forms of decoration, which, in an external form, mix together what is of Roman ancestry and that which belongs to the Middle Ages.

(*c*) On parallel lines with this evolution of religious architecture we find, too, the course of *civil construction*, which from its particular point of view imitates and modifies the character of ecclesiastical buildings. In an architecture directed to the uses of citizen life, however, art has less opportunity for display inasmuch as here objects of more restricted character, combined with a great variety of requirements, are more strict in the range of satisfaction presented, and do not suffer beauty to pass beyond mere decoration. Except for the general harmonious disposition of its forms and masses, art is in the main merely able to assert itself in the embellishment of façades, staircases, windows, doors, gables, towers, and the like, and has to do this throughout subject to the condition that the practical purpose of the building is what finally determines everything. In the Middle Ages it is pre-eminently the tower-like form of secure dwellings, which is the fundamental type of structure not merely for particular declivities and summits but also within the towns, where every palace, every private dwelling, as in Italy for example, received the form of a small fortification or keep. Walls, doors, towers, bridges and the like are executed as necessity dictates, and are decorated and embellished by art. Stability and security coupled with a grandiose type of splendour and a vital individuality of single forms and their connecting links constitute the determining factors, to enter into the detail of which would carry us beyond our present

purpose. By way of supplement we may in conclusion briefly allude to the art of *gardening*, which does not only create under a wholly novel form an environment for spirit, we may call it a second exterior Nature, but draws the landscape of Nature itself within the operation of its constructive purpose and treats the same architectonically as an environment of buildings. I will only take as an example of what I mean the famous and exceedingly imposing terrace of Sans-souci.

In our examination of the genuine art of gardening it is most important to distinguish the *painter's* point of view of it from that of the *architect.* All that pertains to mere park construction, for instance, is not truly architectonic, no building, that is, with freely disposed natural objects, but an artist's portrayal[109], which leaves the objects in their natural form and aims at imitating wide Nature in its freedom. Everything is here suggested in turn, which finds its glad place in a landscape — whether rocks and the huge rough masses which are their substance, or dales, woods, pastures, meandering brooks, broad streams with their animated banks, still lakes, wreathed round with trees, rushing waterfalls, and everything else of the kind, and is brought together with one total effect. In this way the gardening art of the Chinese embraces entire landscapes together with their islands, rivers, expanding views, and rockeries.

In a park of this kind, particularly in modern examples of such, everything is, on the one hand, intended to hold intact the freedom of Nature, while, on the other, it is artificially elaborated and constructed and conditioned by the locality where it is situated. This involves a contradiction which is never satisfactorily disposed of. In this respect, for the most part, it is impossible to instance an example of worse taste than such an attempt to make visible in all directions a studied purpose in that which is without purpose, and to force that which refuses to be compelled. Add to this the fact that here the genuine character of what is strictly a

garden disappears, in so far, that is, as a garden is primarily adapted for strolling about in at pleasure and conversation within a certain place, which is no longer simply Nature, but a Nature remodelled by man to meet his desire for an environment created by himself. A huge park, on the contrary, particularly if it be garnished with Chinese temples, Turkish mosques, Swiss châlets, bridges, hermitages, and any other conceivable foreign importation, makes an independent claim on our interest as spectator. It offers an independent pretension of being and signifying something. A charm of this sort disappears as soon as it arises; we do not care to see it twice, for an addition like this spreads before our sight no suggestion of infinity, nothing that possesses a really existent vitality[110], and is further only wearisome and tedious for conversation as we pass through it.

A garden, strictly speaking, should be only a cheerful environment and simply an environment, which will not pass for something independently valid and withdraw men from their own life and concerns. It is here that architecture, with its scientific lines, order, regularity, and symmetry, is in its proper place and co-ordinates natural objects themselves architectonically. The art of the Mongols on the other side of the great wall, in Tibet, the paradise of the Persians, already adapt themselves more closely to this type. They are no parks in the English sense, but halls with flowers, springs, courts, and palaces, which have in the form of a retreat in Nature been arranged on a splendid, grandiose, and extravagant scale for the needs of mankind and their convenience. But we find the architectural principle most thoroughly carried out in the French art of gardening, which, as a rule, borders upon great palaces, plants trees in the strictest conformity of line in long avenues, prunes them, builds up straight walls from trimmed fences, and in this way converts Nature herself into a broad dwelling beneath the open sky.

[34] Simply as a physical object.

[35] That of symbolic architecture.

[36] *Als Momente eines Subjektes.* That is as the constituent parts of the mind of one individual.

[37] Herod. I, *c.* 181.

[38] I, *c.* 98.

[39] I, p. 469.

[40] As in obelisks, Memnons, etc.

[41] II, *c.* 162.

[42] *c.* 106.

[43] Symb. (2nd ed.), p. 469. The solar city of Heliopolis.

[44] XXXVI, 14, and XXXVII, 8.

[45] Creutzer I, p. 778.

[46] “History of Architecture,” vol. I, p. 69.

[47] *Wandungen.* I presume this refers to every kind of subdivision no less than boundary walls.

[48] *Pracktgewänden.* Presumably this refers to the isolated structures in which the columns are built — having flat surfaces like walls.

[49] *Balken.* The word would suggest perhaps that Hegel means here beams of any kind.

[50] II, *c.* 155.

[51] Her. II, *c.* 108.

[52] Herodotus dwells on this in the above passage.

[53] II, *c.* 148.

[54] Commentators of Herodotus point out that we have no direct evidence here of their number, which, comparing this with Strabo's account, is doubtful, and still more so the number of the chambers (οἰκήματα). Strabo says there were twenty-seven courts. The connection between the halls was not an architectural one but by means of the chambers and colonnades (παστάδες). See Blakesley's notes, vol. I, pp. 279-80. Neither from Herodotus nor Hegel is it very easy to form a clear notion of the building.

[55] "History of Ancient Building," vol. I, p. 75.

[56] XXXVI, 19.

[57] *Ein Individuelles.* Lit., An individual entity.

[58] The relative pronoun refers to the separation of both aspects.

[59] II, *c.* 126-7.

[60] Her. II, *c.* 125.

[61] *Geschichte der Baukunst der Alten*, I, S. 55.

[62] Symbolical significance.

[63] Wolff's and Buttmann's Mus., B. I, p. 536.

[64] Hegel uses the coined word *osirirt* I presume in this sense.

[65] *Abstraction.* Abstract in the sense of possessing no ideal complexity.

[66] *Verständig.* Comes under the categories of the Understanding.

[67] Lit., "Find the element that is congenial."

[68] That is, the principle of geometrical design and that of organic structure.

[69] That is the beauty and the ulterior aim of utility.

[70] *Verständig.* See note above.

[71] The sphere of mechanical gravity.

[72] I presume *Aufwande* means expense here; it would be more reasonable perhaps to say "waste of room," columns being only too often so much more expensive for their size.

[73] That is, the free treatment of line under scientific forms of abstraction rather than limited to specific modes of organic form in Nature.

[74] *Der Verständigen Gesetzmässigkeit.* The principle of scientific architecture.

[75] Immediate imitation, that is.

[76] Of classical art.

[77] *Symbol des Innern.*

[78] That is, apart from the classical type.

[79] That is, the scientific reason of abstract principle or rule.

[80] *Weil beim Oblongum in der Gleichheit und Ungleichheit ist.* That is, more pleasure is derived from contrast than mere similarity. He then qualifies or explains the general principle.

[81] *Eurhythmie*, that is, eurhythmy or a rhythmic movement between the several parts.

[82] I presume this is the meaning of *die Theorie* here. That is the purposeful motive of the architectural skeleton of the fabric — what explains it rationally.

[83] *Schiebens.* It is possible that Hegel uses the word in its primary sense of "shifting."

[84] The idea is slightly confused in the course of the sentence. It is not the necessity (*des Bedürfnisses*) to build a stable house which has to be held in position, etc., but the structure which that necessity forces men to construct in a certain way.

[85] *Ihre eigenen Momente.* "Its unique traits" is possibly adequate here.

[86] Hegel probably has in his mind when using the expression *verständig bestimmte* the close analogy between the self-exclusive concreteness of reason and the completeness of the circular figure.

[87] It is not quite clear what Hegel means by the *Köpfen der Deckenbalken.* The technical word that corresponds to *Deckenbalken* is “joists”; here, according to the words that follow, it would appear to mean either the last horizontal line of the architrave or the entire growth of the triglyph. As he uses the word *Zwischenraümen* after we appear to be driven on the latter alternative. The frieze, of course, was the entire space between cornice and architrave, including both triglyphs and metopes.

[88] Called *femora.* They were divided by two gutters or drills. The triglyph slightly projected and united perpendicularly cornice and architrave.

[89] *Die Baukunst nach den Grunds. der Alten*, Berlin, 1808, S. III.

[90] He means that the distinct functions are not assigned to those features of the building to which they are naturally or most essentially related.

[91] Hirt, *Geschichte der Baukunst*, III, S. 14-18, and II, S. 151.

[92] He refers to the columns placed round.

[93] *Gesch. d. Bauk.* I, S. 251.

[94] By *sebstständig* Hegel means apparently that there must be nothing in their external form that would divert attention from their essential character.

[95] *Auf dem Unterbau.* I presume this means generally that portion beneath the ground.

[96] I presume what is meant is that in one case the drills or grooves are hollowed in round shape and towards the base in square shape.

[97] What is precisely meant by the expression *durch prismatische Einschnitte* I frankly do not know. The expression *Balken* is evidently used to mark the association between the slabs of stone and beams or rafters.

[98] That is, the spaces between the lower part of the cornice and the uppermost slab of the entablature.

[99] The *coussinet* is that part of the Ionic capital between the abacus and quarter round, which serves to form the volute. There are four volutes or spiral scrolls in the Ionic capital.

[100] The *mutule* is the projecting block worked under the corona of the Doric cornice.

[101] Hirt, *Gesch. der Baukunst*, I, S. 254.

[102] This must, I think, refer to the main moulding of the architrave immediately resting on the column.

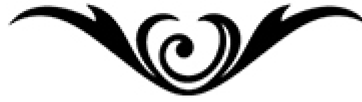
[103] Seneca, Ep. 90.

[104] Lit., "Is raised to infinitude."

[105] As it is, for example, by Greek capitals.

[106] Lit., "In its penetration into the most spiritual (*innerste*, ideal) particularity."

[107] *Sich verselbstständigen.* Hegel means that the main purpose of the exterior is expressed on the face of it.



[108] I presume the word *Durchbrechen* is here used in its specific architectural sense.

[109] *Ein Malen.*

[110] *Keine in sich seyende Seele.* I presume Hegel means that being an artificial fragment of Nature's landscape it lacks the infinite horizon and the living relation to the whole.

SUBSECTION II

SCULPTURE

INTRODUCTION

Over against the inorganic nature of Spirit, in the form we find given it by art in architecture, Spirit opposes itself directly in the sense that the work of art receives and displays spirituality as its actual content. The necessity of this advance we have already adverted to. It underlies the notion of Mind, which differentiates itself under the twofold aspect of subjective self-substantive[111] existence and pure objectivity. In this latter form of externality the ideal substance, it is true, makes its appearance by virtue of the architectonic treatment; such, however, does not amount to a complete transfusion of the objective material, or a conversion of it into an entirely adequate expression of Spirit (Mind), such as suffers it, and only it, to appear. Consequently art withdraws itself from the inorganic realm, which architecture, under its yoke of the laws of gravity, has striven to bring nearer as a means of Spirit's expression, to that of the Ideal, which forthwith then independently asserts itself in its more lofty truth without this intermingling with what is inorganic. It is during this, return passage of Spirit to its own native realm[112] from out of the world of masses and material substance that we come across *sculpture.*

The first stage, however, in this new sphere is, as yet, no withdrawal of mind into the completely *ideal* world of subjective consciousness[113], so that the representation of what is of Spirit would require what is itself a purely ideal mode of expression. Rather Spirit grasps itself, in the first instance, only in so far as it is still expressed in *bodily* shape, and therein possesses

its homogeneous and determinate existence. The art which accepts for its content this attitude to the possessions of Spirit will consequently have, as its due function, to clothe spiritual individuality as a manifestation under *material* conditions, and we may add, in what is actually material to the senses. For discourse and speech are also indications[114] which Spirit assumes under the form of externality, but they belong to a mode of objectivity, which, instead of possessing the attributes we attach to matter in its immediate and concrete sense, is merely as tone, motion, the undulation of an entire body and the rarified element, the atmosphere, a communication of such Spirit. What I call immediate corporeality, on the contrary, is the spatial mode of material substance such as stone, wood, metal, or clay, wholly spatial in all three dimensions. The form, however, which is adequate to Spirit is, as we have already seen, the unique bodily form which belongs to it; and it is through this that sculpture makes what is of Spirit actual in a whole which is subject to the spatial condition.

From this point of view sculpture stands on the same plane as *architecture*[115] to the extent, namely, that it gives form to the sensuous material as such, or what is material according its *spatial* condition as matter. It is, however, to a like extent distinguishable from architecture by virtue of the fact that it does not work up the inorganic substance, as the opposite of Spirit, into an environment created by Spirit and endowed with its purpose in forms to which a purpose is attached which is exterior to it; rather it sets before us spirituality itself in the bodily shape which, from the standpoint of the notion, is adequate to Spirit and its individuality. In other words its efficient function and independent self-subsistency brings indivisibly before our sight both aspects, body and spirit, as one whole. The configuration of sculpture, therefore, breaks away from the specific function of architecture, which is to serve Spirit merely as an external Nature and environment, and assumes a really independent position.

Despite, however, this separation the image of sculpture remains in essential relation to its environment. A statue or group, and yet more a relief, cannot be made without considering the place in which such a work of art is to be situated. One ought not first to complete a work of sculpture and then consider where it is likely to be put, but it should in the very conception of it be associated with a definite exterior world, and its spatial form and local position. In this respect sculpture retains a specific relation to the architectural aspect of space. For the primary object of statues is that of being temple images and being set up in the shrine of the sanctuary, just as in Christian churches painting supplies images for the altar, and Gothic architecture also attests a similar connection between works of sculpture and their local position. Temples and churches, however, are not the only place for statues, groups of statuary and reliefs. In a similar way halls, staircases, gardens, public squares, doors, single columns and arches of triumph receive an animation from the forms of sculpture; and every statue, even though placed in dissociation from such a wider environment, requires a pedestal of its own to mark its local position and base. And here we must conclude what we have to say as to the association of sculpture with or distinction from architecture.

If we further compare sculpture with the other arts we shall find that it is more especially *poetry* and *painting* which will engage our attention. Small statues no less than groups present to us the spiritual form in complete bodily shape, man, in short, as he exists. Sculpture therefore appears to possess the truest means of representing what is spiritual, whereas both painting and poetry have the contrary appearance of being more remote from Nature for the reason that painting makes use of the mere surface instead of the sensuous totality of the spatial condition, which a human form and all other natural things actually assume; speech, too, to a still less

degree, expresses the reality of body, being merely able to transmit ideas of the same by means of tone.

However, the truth of the matter is precisely the reverse of this. For although the image of sculpture appears no doubt to possess from the start the natural form as it stands, it is just this externality of body and nature reproduced in gross material which is not the nature of Spirit as such. If we regard the essential character of it its peculiar existence is that expressed by means of speech, acts, and affairs which develop its ideal or soul-life, and disclose its true existence.

In this respect sculpture has to yield the place of honour and pre-eminently when contrasted with *poetry.* No doubt clarity of outline[116] is superior in the plastic arts, in which the bodily presence is placed before our sight, but poetry too can describe the exterior figure of a man, such as his hair, forehead, cheeks, size, dress, pose and so forth, though of course not with the precision and sufficiency of sculpture. What it loses, however, in this respect is made up by the imagination, which, moreover, does not require for the mere conception of an object such a fixed and definite outline, and before everything else brings before us man in his *action*, with all his motives, developments of fortune and circumstance, with all his emotions, discourses, everything that discovers the soul-life or throws light on external incidents. This sculpture is either wholly unable to do, or only in a very incomplete way for the reason that it neither can present to us the individual soul[117] in its particular inward life and passion, nor as poetry a sequence of expressed results, but only offer us the general characteristics of individuality, so far as the body expresses such, and whatever happens together in one particular moment of time, and this too in a state of repose without the progressive action of real life. In these respects, too, it is inferior to painting. For the expression of spiritual life receives in painting an emphatically more defined accuracy and vitality by means of the colour

given to the human face and its light and shadow, not merely in the sense in which it satisfies generally the material substance of nature, but pre-eminently in the way it expresses physiognomy and the phenomena of emotion. It is possible, therefore, at first to entertain the view that sculpture requires merely for its greater perfection to associate the further advantages of painting with that itself possesses in the spatial totality, and to regard it as a mere act of caprice that it has made up its mind to dispense with the palette of the painter, or, as indicating a poverty and incapacity of its execution, that it entirely restricts its effort to one aspect of reality, namely, that of the material form, and withdraws its attention from that, much as the silhouette and the engraving may be set down as mere makeshifts[118]. We are, however, not warranted in thus applying such a term as “caprice” to genuine art. The form such as it is in the object of sculpture, remains in fact merely an *abstract* aspect of the concrete human bodily presence. Its presentments receive no variety from particularized colours and movements. This is, however, no defect due to accident, but a limitation of material and manner of presentment itself pre-supposed in the notion of art. For Art is a product of mind, and we may add of the more exalted and thoughtful mind. A work of this order claims as its object a content of this defined character, and consequently implies a mode of artistic realization which excludes other aspects. We have here a process similar to that observed in the different sciences where we find, for example, geometry exclusively adopts space as its object, jurisprudence law, philosophy the explication of the eternal Idea and its determinate existence and self-identity in the facts of experience, wherein each of the above mentioned sciences develops these objects by differentiation out of their differences, without one of them actually presenting to consciousness in its completeness that which we are accustomed in ordinary modes of thought to call concrete real existence.

Art then, as a creative informing activity of spiritual origination, proceeds step by step, and separates that which in the notion, in the nature of the thing, albeit not in its determinate existence, is separated. It retains such stages consequently in their self-exclusive finity, in order to elaborate them according to their distinct peculiarities. And what contributes to this notional distinction and exclusive separation in the spatial material substance, which constitutes the element of the plastic art is corporeality in its aspect of spatial totality and its abstract configuration, in other words bodily form simply, and the more detailed particularization of the same relatively to the variety of its *colorization.* We find at this first stage the art of sculpture so placed relatively to the human form, which it treats as a stereo-metric body, merely, that is, according to form which it possesses in the three spatial dimensions. The work of art, whose process is in and through the sensuous material, must no doubt have an existence for another[119], with which forthwith the particularization commences. The primary art, however, which is concerned with the human bodily form as an expression of spiritual life, only proceeds so far in this "being for another" to the point of its first, or rather the still universal mode of Nature's own existence, that is to the point of mere visibility and existence in light generally, without uniting with the same in its presentment the relation of the latter to darkness, in which that which is visible is particularized in its own medium[120] and becomes colour. And the art occupying such a position is that of sculpture. For plastic art, which is unable as poetry to bring together the totality of the phenomenon in one equal element or world of idea, inevitably breaks up this totality[121].

For this reason we get on the one hand *objectivity*, which in so far as it is not the unique configuration of spirit, stands over against it as inorganic Nature. It is this relation of bare objectivity which converts architecture into a mere suggestive symbol, which does not possess its spiritual significance

in itself. The point of extreme contrast to objectivity as such is *subjectivity*, that is the soul[122], emotional life in the entire range of all its particular movements, moods, passions, exterior and interior agitations and actions. Between these two we are confronted with the spiritual individuality which no doubt has a definite structure, but which is not as yet deepened to the extent of the essential ideality of the individual soul; in which, instead of the full personal singularity, the substantive universality of Spirit and its objects and characteristic traits is the prevailing factor. In its generality it is not as yet absolutely withdrawn into its own exclusive domain to the point of purely spiritual unity; rather it comes before us as this midway point[123] still hailing from the objective side, that is the side of inorganic Nature, and consequently even carries as part of itself corporeality, as the particular form of existence appropriate to spirit, in the body that not merely is its own, but also discloses it. In this mode of externality, which no longer remains something simply opposed to what is ideal, spiritual individuality has now to be displayed, not, however, as living form, that is to say as corporeality continuously referred back to the point of unity implied in the singularity of spiritual life, but rather as form set forth and manifested in its external guise, into the mould of which Spirit has no doubt been poured, without, however, being from this outward bond of association, made visible in the sense that it is so when it withdraws into its own essential and ideal domain[124].

From the above observations the two points to which we have already drawn attention become more clear, namely, first, that sculpture makes use of the human form directly, which is the actual existence of spiritual life, instead of accepting a mode of expression which is symbolical with a view to promoting the spiritual import of modes of appearance that are merely *suggestive.* At the same time, secondly, it is content, as the manifestation of that mode of subjectivity which does not express emotion and the soul

essentially unparticularized[125], with *form* and *nothing more*, where the focus of subjectivity is dissipated[126]. This is also the reason why sculpture does not on the one hand present Spirit in action, in a series of movements, which both possess and testify to one aim nor in undertakings or exploits, wherein a certain character is made visible, but rather as persisting throughout in one objective way, and for this reason pre-eminently in the repose of form, the movement and grouping of which is merely a first and obvious commencement of action, not, however, in any sense a *complete* presentment of the subjective life as agitated by all the conflicts that assail it whether within or without, or as its development is variously affected in contact with the external world. Consequently what we also miss in the figures of sculpture is precisely this revealed focus of the subjective life, the concentrated expression of soul as *soul*, namely, the glance of the eye, a fact upon which we shall have something further to say later. We miss it because such a figure presents to our sight Spirit embedded in corporeality, and Spirit, too, which has to show itself visible in the entire form. From another point of view an individuality, which is not as yet essentially separated into its component parts, that is, the object of sculpture, does not as yet require the painter's charm of colour as means to display it, a charm which is as capable of making visible, through the fine gradations and variety of its nuances, the entire wealth of particular traits of character, the absolute manifestation of spiritual presence, its ideal significance[127], as by means of the vital flash of the eye it will concentrate in a point all the vigour of the soul. Sculpture must not, in other words, accept a material which is not rendered necessary by its fundamental point of view. It only makes use of the spatial qualities of the human figure, not the colouring which depicts it. The figure of sculpture is in general of one colour, hewn from white not vari-coloured marble. And in the same way metals are used as the material of sculpture, this primitive substance, self-identical, essentially

undifferentiated, a light in fluxion, if we may so express it, without the contrast and harmony of different colours[128]. The Greeks are indebted to their unrivalled artistic insight[129] for having grasped and firmly retained this point of view. No doubt we find, too, in Greek sculpture, to which we must for the main part confine ourselves, examples of coloured statuary; we must, however, take care in this respect to distinguish both the beginning and end of this art from that which is created at its culminating point.

In the same way we must discount that which is admitted by art in deference to traditional religion. We have already found it to be true in the classical type of art that it does not forthwith and immediately set forth the Ideal, in which its function is to discover its fundamental lines of definition, but in the first instance removes much that is inconsonant with it and foreign; it is the same case precisely with sculpture. It is forced to pass through many preliminary stages before it arrives at its perfection; and this initial process differs very considerably from its supreme attainment. The most ancient works of sculpture are of painted wood, as, for example, Egyptian idols; we find similar productions among the Greeks. We must, however, exclude such examples from genuine sculpture when the main point is to establish its fundamental notion. We are therefore in no way concerned to deny that there are many examples at hand of painted statues. It is, however, also a fact that the purer art-taste became, the more strongly "sculpture withdrew itself from a brilliancy of colour that was not really congenial, and with wise deliberation utilized, on the contrary, light and shadow in order to secure for the beholder's eye a greater softness, repose, clarity, and agreeableness[130]." As against the uniform colour of the bare marble we may no doubt not merely instance the numerous statues of bronze, but also in still stronger opposition the greatest and most excellent works, which, as in the case of the Zeus of Pheidias, were artificially coloured. But we are not here discussing absence of colour in such an

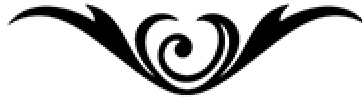
extreme abstract sense. Moreover, ivory and gold are not primarily the use of colour as the painter employs it; and generally we may add that the various works of a definite art do not ever in fact retain fixedly their fundamental notion in so abstract and unyielding a way, inasmuch as they come into contact with the conditions of life subject to aims of all kinds; they are placed in different environments, and are thereby associated with circumstances of an external kind, which inevitably modify their real and essential type. In this way the images of sculpture are not unfrequently executed in rich material such as gold and ivory. They are placed on magnificent chairs or stand on pedestals which display all the extravagance and luxuriousness of art, or receive costly decorations, in order that the nation, when face to face with such splendid works, may likewise enjoy the sense of its power and wealth. And sculpture in particular, for the reason that it is essentially, taken by itself, a more abstract art, does not on all occasions hold fast to such exclusiveness, but, on the one hand, introduces incidentally much that is of a traditional, scholastic, or local character as a contribution from its history, while, on the other, it ministers to vital popular necessities. Active humanity demands for its diversion variety, and seeks in diverse directions for a stimulus to its vision and imagination. We may take as an analogous case the reading aloud of Greek tragedies, which also brings before us the work of art under its more abstract form. In the wider field of external existence we have still to add, to make a public performance, living actors, costume, stage scenery, dancing, and music. And in like manner, too, the sculptured figure is unable to dispense with much that is supplementary on its own stage of reality. We are, however, only concerned here with the genuine work of sculpture as such; external aspects such as those above adverted to must not be permitted to prevent us bringing before the mind the notion of our subject-matter in its most ideal and exclusive sense of definition.

Proceeding now to the more definite *heads of division* in this section we may observe that sculpture constitutes the very centre of the *classical* type of art to such a degree that we are unable to accept the symbolical, classical and romantic types as distinctions which affect throughout and form the basis of our division. Sculpture is the genuine art of the classical Ideal simply. It is quite true that sculpture has also its stages in which it is in the grasp of the *symbolical* type, as in Egypt for example. But these are rather preliminary stages of its historical evolution, no genuine distinctions which essentially affect the art of sculpture when notionally considered, in so far, that is, as these exceptional examples, in the manner of their execution and the use that is made of them, rather belong to architecture than are strictly within the aim and purpose of sculpture. In a similar way, when we find the *romantic* type thereby expressed, sculpture passes beyond its rightful sphere, and only receives with the qualified imitation of Greek sculpture its exclusively plastic type. We must therefore look about us for a principle of division of another character.

In agreement with what we have just stated we shall find that it is from the particular way in which the *classical Ideal* means of sculpture acquires a form of reality that most fully expresses it that the focus of our present inquiry is derived. Before, however, we are in a position to make an advance in this evolution of the ideal figure of sculpture we must by way of introduction demonstrate what kind of *content* and *form* are pertinent to the point of view of sculpture regarded as a specific art, and the course it follows by virtue of both until the point is reached where the classical Ideal is fully unfolded in the human form permeated by spiritual life, and in its shape as subject to spatial condition. From another point of view the classical Ideal stands, and falls with an individuality which is unquestionably substantive, but also to an equal degree essentially particularized, so that sculpture does not accept for its content the Ideal of

the human form in its *generality*, but the Ideal as *specifically defined*; and, by virtue of this fact, it is variously displayed under forms distinct from each other. Such distinctions partly originate in the conception and *representation* simply, in part are due to the *material* in which such is realized, and which further, according to the way it affects execution, introduces points of severation on its own account, to both of which finally, as the last ground of difference, the various stages are related in the *historical* development of sculpture.

Having made these observations we will indicate the course of our inquiry as follows.



In the *first* place we have merely to deal with the *general* determinants of the essential *content* and *form*, such as are deducible from the notion of sculpture.

Secondly, as a further step, we have to differentiate more closely the nature of the classical Ideal, in so far as it attains a determinate existence in its most artistic form.

Thirdly, and finally, we shall find that sculpture avails itself of various types of presentation and material, and expands to a world of productions, in which, either under one aspect or another, the symbolical or romantic types also definitely assert themselves, albeit it is the classical which constitutes the true point of centre between them in plastic art[131].

CHAPTER I

THE PRINCIPLE OF GENUINE SCULPTURE

SCULPTURE, TO PUT the matter in general terms, conceives the astounding project of making Spirit imagine itself in an exclusively material medium, and so shape this external medium that it is presented to itself in such and recognizes the presentment to be the objective form adequate to its ideal substance.

In this respect our inquiry will take the following directions.

First, we have the question what kind of *spiritual life* is capable of being reproduced in this material of a form entirely sensuous and spatial.

Secondly, we have to ask in what manner the *forms* of the spatial condition have to be modified in order to permit us a recognition of the spiritual in the bodily shape of beauty.

What we have generally to consider here is the unity between the *ordo rerum extensarum* and that of the *ordo rerum idearum*, the primal fair union of soul and body, in so far as spiritual ideality is expressed by sculpture exclusively in its bodily existence.

This union, *thirdly*, corresponds to what we have already found to be the Ideal of the classical type of art; and for this reason the plastic forms of sculpture are nothing less than the very art itself of the classical Ideal.

1. THE ESSENTIAL CONTENT OF SCULPTURE

The elementary medium, in which sculpture realizes its creations is, as we have seen, the elementary, still universal material subject to spatial condition, in which no further particularization can be utilized for an artistic

purpose than the universal spatial dimensions, and the more detailed[132] spatial forms which are compatible with these dimensions under their most beautiful configuration. Now what most exceptionally corresponds as content to this more abstract aspect of the sensuous material is the *objectivity* of Spirit which reposes on its own resources, in so far, that is, as Spirit has neither differentiated itself in contradistinction to its universal substance, nor to its determinate existence in its bodily presence, and consequently is not as yet withdrawn as independent self-subsistency into its own subjective world. There are two points we would draw attention to here.

(*a*) Spirit as Spirit[133] is no doubt always subjectivity, that is ideal knowledge of the Self, the Ego. This Ego can, however, separate itself from everything that constitutes, whether in knowledge, volition, conception, feeling, action, or achievement, the *universal* and eternal content of Spirit, and can concentrate its hold on that aspect of *individual* experience which is unique and contingent. It is then *subjectivity as such* which we have before us, which has let go the truly objective content of Spirit, and is self-related formally, and without content. In the case of self-satisfaction, for example, I can no doubt view myself from a certain standpoint in an entirely objective way and remain satisfied with myself on account of moral action. I do, however, as thus self-satisfied, already withdraw myself from the content of such action. I separate myself as a distinct person, as this particular Ego, from the universality of Spirit, in order to compare myself with it. The sense of unison of myself with myself through this comparison produces this self-satisfaction, in which this determinate Ego, as this core of unity, rejoices in itself. No doubt this personal Ego is involved in all that a man knows, wills, or carries out; but it makes an immense difference whether, in-dealing with knowledge and action, the matter of concern is the man’s own unique Ego, or that in which the essential content of consciousness

consists; whether, in other words, a man sinks himself and his self-identity in this content, or lives in the unbroken seclusion of his subjective personality.

(*α*) In this exaltation over what is substantive[134] the subjective life passes into the abstract and disrupt world of personal inclination, the caprice and contingency of emotions and impulses, owing to which, in the changes to which it is subject in particular acts and undertakings, it grows dependent upon particular circumstances as they happen to arise, and is unable generally to dispense with this association with something else. In such a condition of dependence the individual life is nothing but *finite* subjectivity as contrasted with a real spirituality. And if this personal state essentially persists through the volition and knowledge which characterizes it in this contradiction of its conscious life, it can only further become involved — to put on one side the mere emptiness of its imaginings and self-conceits — in the deformity of character and its evil passions, in crime and moral offence, in malice, cruelty, obstinacy, envy, pride, insolence, and every other kind of the reverse side of human nature and its insubstantial finiteness.

(*β*) This province of the subjective life must be excluded in its entirety and without hesitation from the content of sculpture. The art is exclusively co-extensive with the objectivity of Spirit. And by the term objectivity we mean in this connection what is substantive, genuine, not transitory, the essential nature of Spirit, apart from its involvement in that which is accidental and evanescent, for which the individual person is responsible simply in his unmediated state of self-relation.

(*γ*) Spirit, however, even in its truly objective sense, can only realize itself as Spirit when associated with *explicit self-identity.* Spirit is only Spirit as self-consciousness[135]. The position, however, of this aspect of individual consciousness in the spiritual content of sculpture is of such a character that it is not independently expressed, but displays itself as

throughout interfused with this substantive content, and not formally reflected back upon itself apart from it. We may consequently affirm that though such a mode of objectivity possesses a type of self-subsistency, yet it is a self-knowledge and volition which is not released from the content it fulfils, but forms an inseparable unity with it.

The presentment of Spirit in this complete and independent seclusion of what is essentially substantive and true, this unperturbed and unparticularized being of Spirit, is that which we name divinity in its contrast to finitude, which is the process of disruption into contingent existence, a world that is broken into complex forms and varied movement. From this point of view the function of sculpture is to present the Divine simply in its infinite repose and sublimity, timeless, destitute of motion, entirely without subjective personality in the strict sense and the conflict of action or situation. And in proceeding to the more detailed definition of our humanity in shape and character, it must, nevertheless, exclusively rivet its attention on what is unalterable and permanent, in other words what is truly substantive in its characterization, and merely select such aspects for its content, passing over what it finds there of an accidental or evanescent nature; and it must do so for the reason that the objectivity which it presents does not rightly include a differentiation of this fluctuating and fleeting kind, and one which comes into being by virtue of a subjective consciousness whose conception of itself is that of pure insulation. In a biography, for instance, which gives an account of the motley incidents, events, and exploits of some individual, we find as a rule the course of varied developments and fortuities finally closed by a character sketch which summarizes the entire breadth of detail in a few general qualities such as goodness, honest dealing, courage, exceptional intelligence, and so forth. Characteristics such as these we may term the permanent features of a personality; the remaining peculiarities it possesses are merely accidental

features in the impersonation. It is just this stable aspect of life which it is the part of sculpture to present as the unique being and determinate substance of individuality. Yet we must not suppose that it creates allegories out of such general qualities. It rather builds up true individuals, which it conceives and informs as essentially complete and enclosed within their objective spiritual presence, in their self-subsistent repose, delivered thereby from all antagonism as against external objects. In the presentment of an individuality of this character by sculpture what is truly substantive is throughout the essential foundation, and neither purely subjective self-knowledge and emotion, nor a superficial and mutable singularity[136] must be permitted in any way to be predominant, but what is eternal in the god-like and our humanity should, divested of all the caprice and contingency of the particular self[137], be set before our eyes in its unimpaired clarity.

(*b*) The further point we would draw attention to consists in this, that the content of sculpture, for the reason that its material requires an external presentment in the complete form of the three spatial dimensions, is also unable to be a *spiritual content* as such, that is, the ideality self-enclosed within and absorbed into itself, but rather in the sense that it is only *explicit* in its opposed factor, in other words, the *bodily form.* The negation of what is external is already implied in the ideal subjective consciousness, and can therefore have no place here, where what is divine and human is accepted as content with exclusive reference to its objective characteristics. And it is only this self-absorbed objective aspect, which does not comprise ideal subjectivity in the strict sense[138], that gives free play to an externality conditioned in all its three dimensions, and is capable of being associated with such a spatial totality. For these reasons it is incumbent on sculpture that it only accept out of the objective content of Spirit that which admits of the fullest expression in external and bodily shape; if it do otherwise it

simply selects a content which its specific material is unable to assimilate or to unite with an adequate mode of exposition.

2. THE BEAUTIFUL FORM OF SCULPTURE

We must now inquire into the nature of the bodily *forms* which are adapted to give an impression of a content of this kind.

Just as in classical architecture the dwelling-house is the anatomical skeleton framework which art has to inform with its accretions, in like manner sculpture, on its part, discovers the *human form* as the fundamental type for its figures. Whereas, however, the house is already a piece of human workmanship, though not as yet elaborated artistically, the structure of the human form, on the contrary, appears as a product of Nature unaffected by man. The fundamental type of sculpture is consequently *given* to it, that is, does not hail from human inventiveness. The expression, however, that the human form is a part of Nature is a very indefinite one, which we must submit to closer analysis.

In Nature it is the Idea, which is given there, as we have already found when discussing natural beauty, its primary and immediate mode of existence, receiving in animal life and its complete organic structure the *natural* existence adequate to its notion. The organization of the animal frame is therefore a birth of the notion in its essential totality, which exists in this corporeal mode of being as soul, yet, as the principle of merely animal life, modifies the animal frame in the most varied classifications, albeit too every specific type continues to be subject to the general notion[139]. The fact that notion and bodily form, or more accurately, soul and body, correspond to one another — to fully understand this is the problem of natural philosophy. We should have to demonstrate that the different systems of the animal frame in their ideal[140] structure and conformation no

less than their association, and the more definite organs in which the bodily existence is differentiated are in general accord with the phasal steps of the notion's movement, so that it becomes clear, to what extent we have here presented to us as real only the particular aspects of the soul-life which are necessary. To develop this exposition, however, does not lie within the scope of the present inquiry.

The human form is not, however, as the animal form, merely the corporeal framework of the soul, but of *Spirit.* In other words, spirit and soul are essentially to be distinguished. For the soul is merely this ideal and simple unity of self-subsistence attaching to the body in its *corporeal* aspect[141], whereas Spirit is the independent selfness of conscious and *self-conscious* life together with all the emotions, ideas, and aims of such a conscious existence. In contemplating the immense difference which separates merely animal life from spiritual consciousness, it may appear strange that the bodily frame attaching to the *latter*, the human body, is nevertheless so clearly homogeneous with that of animal life. It will tend, however, to decrease such an astonishment if we recall to mind the definition, which Spirit itself has authorized us to make in accordance with its own notion, that it is a mode of life and essentially therefore itself also a *living soul* and *natural existence.* As such living soul the life of conscious spirit, by virtue of the same notion that is inherent in the animal soul, is entitled to accept a body, which fundamentally in its general lines runs parallel to the organic structure of animal life. However superior to mere animal life Spirit may be it is evolved through[142] a corporeal frame whose visible appearance receives an identical articulation and principle of life with that which the notion of animal life in general underlies. Inasmuch as, however, and furthermore Spirit is not merely the *Idea* as *determinate existence*, that is, the Idea as Nature and animal life, but the Idea which secures independence in its own free medium of ideality as Idea, the

spiritual principle elaborates for itself its own specific mode of objectivity over and beyond that of animal life, simply, in other words, science, the reality of which is exclusively that of thought itself. Apart from thought, however, and its philosophical and systematized activity, Spirit is involved within an abounding life of feeling, inclination, idea, imagination, and so forth, which is fixed in a more direct or less immediate association with its vital being[143] and bodily frame, and consequently possesses a reality in the human body. In this reality, which is part of its own substance, Spirit asserts itself also as a principle of life, shines into it, transpierces it, and is made manifest to others by means of it. Consequently, in so far as the human body remains no purely natural existence, but has asserted itself also in its configuration and structure as the natural and sensuous existence of Spirit, it is, nevertheless, regarded as the expression of an ideality more exalted than that compatible with the purely animal body to be distinguished from it, despite the fact that the human body in its broad lines is in harmony with it. For this reason, however, that Spirit is itself soul and life, that is, an animal body, it is and can only be modifications, which the indwelling Spirit of one living body attaches to this corporeal form. As a manifestation of Spirit consequently the human shape is distinct from the animal by virtue of these modifications, albeit the distinctions of the human organism from the animal are as much the result of the unconscious creation of spiritual activities, as the soul of the animal kingdom is the informing though unconscious activity of the body that belongs to it.

We have thus reached the precise point of our present departure. In other words, the human body is present to the artist as Spirit's expression. What is more, he discovers it as such not merely in a general way, but also in particular characteristics it is pre-supposed to be the type which, in its form, its specific traits, its position and general habit, reflects the ideality of Spirit.

We shall find it a difficult matter to fix in clear terms of thought the precise nature of the association between spirit and body in their relation respectively to feeling, passion, and other spiritual conditions. It has, no doubt, been attempted to develop the same scientifically both from the *pathognomical*[144] point of view and the *physiognomical.* Such attempts have hitherto not met with much success. For ourselves the science of physiognomy can only be of importance in so far as that of pathognomy is exclusively concerned with the mode under which definite feelings and passions are physically located in particular organs. It has been stated, for example, that the seat of anger is in the gall, of courage in the blood. Such statements, we may remark incidentally, are erroneous in their manner of expression. For even assuming the activity of particular organs corresponds to specific passions, we cannot say that anger, for instance, has its local position in the gall bladder, but, in so far as anger is corporeally related, the gall is pre-eminently that in which its active appearance asserts itself. In our present inquiry this pathognomical aspect does not, as already stated, concern us, because sculpture has merely to deal with that which passes over from the ideal side of Spirit into the external aspect of *form* permitting Spirit thus to be visible in the physical environment. The sympathetic interaction between the internal organism and the feeling soul is no object of sculpture; indeed, we may add, it is unable to accept much which appears on the external surface itself, such as the tremble of the hand and the entire body in an outburst of anger, the movement of the lips, and others of like nature.

With regard to physiognomical science I will limit myself to this observation. If the work of sculpture, which has as its fundamental basis the human form, has to exhibit the way in which the bodily presence as such manifests not only the divine and human aspect of Spirit in its broadest and most substantive features, but also the particular character of a definite

individuality in this divine presence, we are no doubt compelled to discuss what parts, traits, and conformations of the body are fully accordant with any specific mode of ideality. We are indeed forced upon such an inquiry by the sculpture of antiquity, which we must as a matter of fact admit includes the expression of individual god-like characters with that of divinity generally. Such an admission does not, however, amount to an assertion that the association of spiritual expression with bodily form is merely a matter of accident and caprice rather than the creation of a figure of self-subsistent actuality. In this connection every organ must, in a general way, be looked at from two points of view, as a mode of expression that possesses its physical side no less than its spiritual. We need hardly caution our readers that the method of Gall in conducting such an inquiry is inadmissible. This writer reduces Spirit to what is little better than a Calvary.

(*a*) The advance of sculpture, in respect to the content which its function is to declare, is limited to the investigation how far the substantive and at the same time individual condition of spiritual life is made vital in bodily form, receiving therein determinate existence and form. In other words, through the content adequate to genuine sculpture the contingent *individualization of the external appearance* is from one point of view excluded, and this applies both to the spiritual and physical aspects of the presentment. Only that which persists, and is universal and according to rule in the human form is the object of a work of sculpture. And this is so albeit we have the additional necessity to individualize the universal in such a way that not only the abstract law but an individual form, which is brought into the closest fusion with it, is placed before our eyes.

(*b*) From another point of view it is necessary that sculpture, as we have seen, be kept unaffected by purely contingent *personal life*[145], and all expression of such in the independent ideal mode under which it asserts itself. For this reason an artist, in dealing with physiognomical

characteristics, is not entitled to move in the direction of individual manner[146]. For a facial manner is simply just this appearance on the surface of an individual idiosyncrasy and some particular aspect of emotion, idea, and volition. A man by his chance expressions of countenance expresses the feelings he has as some particular person, whether it be in his exclusive relation to his own life, or in his self-relation to exterior objects, or other persons. One sees, for example, on the street, more particularly in little towns, in many, or rather the majority of men, that they are exclusively preoccupied, in their demeanour and expression of face, with themselves, their dress and attire, in general terms, that is, their purely personal particularity, or, at least, matters of momentary importance, and any unforeseen or accidental features thus presented. Countenances which express pride, envy, self-satisfaction, depreciation, and so forth, are of this nature. Moreover, the feeling and contrast of substantive being with my personal idiosyncrasy may be responsible for such alterations of expression. Humility, defiance, threats, fear, are expressed in this way. In a felt contrast of this kind we find already a separation between the individual in the subjective sense and the universal asserted. Reflection on what is truly substantive continually leans in the direction of merely personal considerations, so that it is the individual rather than the substantive character which is predominant in the content. The form, however, which remains severely true to the principle of sculpture ought neither to express this severation nor the predominance of the personal aspect above adverted to.

In addition to definite expressions of countenance[147] physiognomy presents us with much that merely passes momentarily across the features and indicates the human mood. A sudden smile, an instantaneous outburst of anger, a quickly repressed expression of scorn, are a few of many examples. In particular, the mouth and eyes possess most mobility and

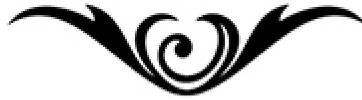
resource in seizing and making apparent every shifting mood of soul-life. Changes of this character, which are compatible with the art of painting, the sculptor must exclude. Sculpture must rather concentrate its attention on the permanent traits of spiritual expression, and retain and disclose such in the posture and configuration of the body no less than in the face.

(*c*) The task of sculpture, then, essentially consists in this, that it implants that which is of substantive spiritual import in that form of individuality which is not yet essentially particularized in the narrow subjective sense within the figure of a man, and contributes to the same such a harmony, that it is only that which is universal and permanent in the *bodily shapes* correspondent with the life of Spirit which is made to appear therein, while that which is accidental or mutable is brushed aside, albeit a certain mode of individuality is not absent from its forms.

An accord of this complete nature between what is ideal and what is external, the goal of sculpture, in short, offers us a point of transition to the *third* point which we have still to discuss.

3. SCULPTURE AS THE ART OF THE CLASSICAL IDEAL

The conclusion that most immediately follows upon the above observations is this, that sculpture in a way, and to an extent unrivalled by any other art, remains constant to the Ideal[148]. In other words, from one point of view it is free of the symbolical type both by virtue of the translucency of a content, which clearly grasps itself as Spirit, and on account of the fact that it is able to disclose such a content with absolute mastery. And so, too, from another it refuses as yet to enter into the subjective aspect of the personal life, to which the external form is indifferent. Consequently it forms the focus of classical art. No doubt both the symbolical and romantic types of architecture and painting were shown to be adapted to classical ideality; but the Ideal, in its genuine sphere, is not the supreme principle of these types



of art, inasmuch as they do not, as is the case with sculpture, take for their object self-subsistent individuality, character, that is, throughout objective, in other words, the beauty that is both free and inevitable[149]. The configuration of sculpture must, however, entirely proceed from the pure spiritual energy of an imagination and thought that denudes its content of all the haphazard features of personal life and bodily presence; it must have no leanings for idiosyncrasies, or any place for the mere emotion, desire, and variety of accidental impulse and pleasantry[150]. What the artist has at his disposal for his most elevated creations is simply, as we have seen, the bodily presentment of Spirit in what is exclusively the general configuration of the organic structure of the human form. His invention is therefore restricted to promoting on the broadest lines the harmony between what is ideal and what is external, and partly to making, in however an inobtrusive way, the individuality of the presentment accommodate itself to and interfuse with the truly substantive character of his design[151]. Sculpture must give form, just as the gods create in their own sphere according to eternal ideas, within what is in other respects the world of reality, but exclude as rejected residue all licence and mere selfness from its creations. Theologians make a distinction between the acts of God and all that man in his folly and capriciousness accomplishes. The plastic Ideal is, however, exalted above such questions. It stands at the very centre of this blessedness and free necessity for which neither the abstraction of the universal nor the caprice of the particular are valid or significant.

This insight into the consummate plastic union of the divine and human was pre-eminently native to Greece. We fail to grasp Greece at her heart and centre in her poets and orators, historians and philosophers, unless, as the key to our problem, we are already possessed of an insight into the Ideal of sculpture, and can contemplate from the standpoint of plastic art both the figures of her epic and dramatic heroes and her actual statesmen and

philosophers. For characters in her practical life, no less than poets and thinkers, possessed also in the palmy days of Greece, this plastic, universal, and yet individual character, stamped with one mint, whether we look at its external or more personal features. They stand up big and free, a self-subsistent growth, on the basis of their essentially substantive individuality; a growth of their own making, built up into that which they ultimately became and intended to be. In particular the period of Pericles was rich in such characters. Pericles himself was one of them. We may add Pheidias, Plato, and pre-eminently Sophocles. So, too, Thucydides, Xenophon, and Socrates, everyone with his own type, not one of them impairing the quality of the rest; all are out-and-out artistic natures, ideal artists in the work of self-creation, personalities of one mould, works of art, which stand before us like figures of immortal gods, in whom we can detect no taint of Time and mortality. We may find a similar plastic subsistency in the artistic perfections of the bodily frames of the victors at the Olympic games; nay, even in the apparition of Phryne[152] herself, who, as the fairest woman, came from the sea naked before all the world.

CHAPTER II

THE IDEAL OF SCULPTURE

NOW THAT WE pass on to consider the really ideal style of sculpture we must once again recall the fact that the perfected type necessarily presupposes the imperfect as its predecessor; and it does so not merely in relation to its technique, which, in the first instance, does not concern us here, but in respect to the general notion, in other words the mode of its conception and the particular way in which it sets forth the same ideally. We have in general terms called the symbolical type that of inquiry; consequently pure sculpture, too, has for its presupposition a certain stage of the symbolical type, and by this we do not merely mean a stage of the symbolic form as generally conceived, in other words of architecture, but a form of sculpture which is itself characterized by the symbolical principle. We shall find an opportunity of supporting this assertion with the example of Egyptian sculpture in the third chapter.

We may in this place and from the point of view of the Ideal generally, and for the present wholly in an abstract and formal manner, assume that which we term symbolical in a specific art is its *incompleteness*; as, for example, we may so apply this term to an attempt of children to draw the human figure, or mould it from wax and clay. What they execute is to this extent merely a symbol, as it only *suggests* the living reality it purports to exhibit, remaining, however, wholly unfaithful to the actual object and its significance. Art is consequently in the first instance hieroglyphical, no mere accidental and capricious mark, but a haphazard delineation of an object for the imagination. For this purpose a badly drawn figure suffices if

it recalls that object it is intended to suggest. In a similar way piety is content with badly executed images, and still worships Christ, the Virgin, and any other saint in the most bungling counterfeit, although such images may merely derive such individualization purely from particular attributes conveyed by such means as a lantern or a mill-stone. For piety refuses to be reminded of aught save the object; the soul adds all else thereto, which will be filled up with an image of the object, however untrue the counterfeit may be. It is not the living expression of the present which is required; it is not that which is presented which is intended to enkindle us by itself. Rather a work of art of this kind already brings satisfaction if it excites the general concept of the objects by virtue of its images, however insufficient they be. A concept of this kind, however, already abstracts from the given content. I can readily imagine some known thing, such as a house, a tree, a man; but even in such a case, where the reference is to something quite determinate, the concept merely includes wholly general traits, and is in fact only a *true concept*[153] in so far as it has effaced from the concrete presentment the wholly immediate singularity of the objects and simplified the same. If the imaged concept, which the work of art has to arouse in us, is that of the divine nature, and if this has to receive recognition from an entire people, this object is especially attainable when no *alteration* is allowed in the mode of presentation. For this reason art is on the one hand conventional, and on the other scholastic[154]; and this is so not merely in the case of the more ancient Egyptians, but also in that of more ancient Greek and Christian art. The artist in such case was bound to restrict himself to definite forms and to repeat their type.

The crucial point of transition, where fine art wakes from its sleep, must consequently be sought there, where at last the artist is creative by virtue of his own free conception, where the flash of genius strikes into the material presented, and communicates freshness and vitality to the presentment.

Then for the first time the atmosphere of mind[155] enfolds the work of art, which is no longer restricted to merely calling up in a general way some idea before the mind, and recalling to it some deeper significance which the spectator already is essentially possessed of, but which proceeds to make visible this significance as throughout made vitally present in some individualized creation, and which consequently neither makes no further advance beyond the purely superficial generality of its forms, nor binds itself on the other hand, in respect to the detail of its delineation, to the characteristics of all that common reality offers it.

In the rise of ideal sculpture we presuppose perforce a complete passage to such a sphere of creation. In establishing the facts of this appearance we may emphasize the following points of view.

First, we have to address ourselves to the general character of the ideal form in its contrast to the stages previously discussed.

Secondly, we shall have to adduce specific aspects of it, the importance of which is most obvious, such as the way in which facial characteristics, drapery, and pose are modelled or treated.

Thirdly, we have to enforce the position that the ideal figure is not merely a general type of beauty in the formal sense of type, but includes, by virtue of its principle of individuality, which belongs to the really living Ideal, essentially, too, the aspect of differentiation and specific definition within its own sphere, and by this means the province of sculpture is expanded in a cycle of particularized images of gods and heroes.

1. THE GENERAL CHARACTERIZATION OF THE IDEAL FIGURE OF SCULPTURE

We have already examined at length what the general principle of the classical ideal is. Our present inquiry is therefore limited to the particular mode under which this principle is realized through the medium of

sculpture in the human form. In this connection the lines of difference between the human physiognomy, expressive as it is of spiritual life and the general build of the animal organism, which is unable to pass beyond the mere expression of natural life in its unbroken association with natural wants and an organism that is exclusively adapted to their satisfaction, will supply us with a standard of comparison which carries us considerably further. Yet even such a standard is still somewhat indefinite for the reason that the human form alone neither is as bodily form, or as an expression of Spirit, wholly and as we find it first of ideal type. On the contrary we may observe with more closeness from the fine masterpieces of Greek sculpture what the ideal of sculpture in the spiritually fine expression of its creations has to bring before us. It was pre-eminently Winckelmann who, with this intimate knowledge of and devotion for art of this kind, and by means of his receptive enthusiasm, no less than his intelligence and critical faculty, made an end of indefinite statements over the Ideal of Greek beauty by leaving the characterization of detail in the form at once distinct and precise, an endeavour which by itself is full of instruction. No doubt the results he obtained supply abundant opportunity for further criticism, exceptions, and the like; but we should be careful, before attempting to criticize details and errors in his work, not to obscure the main result which he established. However far aesthetic science may extend its borders that at least must be pre-supposed as essential. Assuming this, it cannot, however, be denied that since Winckelmann's death our knowledge of the antique has not only been essentially enlarged in the number of examples submitted to criticism, but also has been placed on a securer basis in its relation to the style of these works and the true appreciation of their beauty.

Winckelmann, no doubt, passed under review a great number of Egyptian and Greek statues; we have, however, added in more recent times the closer acquaintance of the Aeginetan sculptures, no less than those

masterworks which in part are ascribed to Pheidias and in part we must recognize as creations of his age and under his supervision. In a word we have secured a more intimate knowledge of a number of sculptures, whether single statues or reliefs, which, in their relation to the severity of the ideal style, are referable to the age in which Greek art was at its fullest bloom. For these astonishing monuments of Greek sculpture, as is well known, we are indebted to the efforts of Lord Elgin, who, as English ambassador to Turkey, had a number of statues and reliefs of the greatest beauty taken from the Parthenon at Athens and other towns to England. People have blamed such acquisitions and called them temple robbery. Lord Elgin has, however, as a matter of fact, really rescued these works of art for Europe and preserved them from complete destruction. Such an enterprise deserves its true recognition. Moreover, it is due to this circumstance that the interest of all connoisseurs and friends of art have been directed to an epoch and a mode of presentation, which, in the exceptionally consistent severity of its style, constitutes the true greatness and height of the Ideal. What the general verdict has highly estimated in the works of this epoch is not the charm and grace of form and pose, not the elegance of expression which already, as in the times subsequent to Pheidias, makes an external appeal and distinctly aims at pleasing the spectator, nor yet the delicacy and boldness of the elaboration; rather the general chorus of praise is concentrated upon the expression of self-subsistency and essential repose in these figures, and more especially has this note of admiration been most emphatic by virtue of the free vitality, the absolute transfusion of and command over the purely natural and material aspect, a command by which the artist moulds the marble, makes it alive and endows it with a soul. And we may add that when all has been said that can be said in such praise the figure of the reclining river-god remains as most emphatically its object, which is one of the finest examples of antique art we have recovered.

(*a*) The vitality of these works consists in this, that they are the free product of the genius of the artist. The artist at this stage is neither satisfied with giving, by means of general and haphazard contours, suggestions and expressions, a general conception of that which he desires to reproduce, nor does he, on the other hand, in respect to what is individual and singular, accept the forms as he has received them by chance from the external world. For this reason also he does not present them again with loyalty to this accidental aspect, but he is concerned to place within his own free creation what is empirically particularized in isolated aspects that thus appear in a further individual accord with the universal types of the human form, an accord which is made to appear as throughout transpierced with the spiritual configuration of that which he is called to make apparent, when he suffers us to see his own vitality, conception and animation in the work regarded on the side of the artist's activity. The universal aspect of the content of his work is not due to his creation. It is presented him by means of mythology and saga precisely in the way that he finds the general effect and details of the human form; but the free and living individualization, which permeates all portions on his work, is the result of his own personal point of view, his efforts and services.

(*b*) The effect and charm of this vitality and freedom is only produced by means of the sufficiency, the honest candour of the elaboration of all the particular parts to which the most definite knowledge and review of the construction of these parts belongs, no less in their position of repose than also in that of their motion. The way in which the different members are disposed and moulded with regard to rondure and smoothness, in every condition of rest and movement, must be expressed in the most satisfactory way. This fundamental elaboration and placing in relief of all the separate parts we find in all products of antique art, and the animation thus produced is only the effect of infinite pains and truth. When the eye contemplates

works of this kind it is, in the first instance, unable clearly to recognize a mass of distinction; and it is only by virtue of a particular manner of lighting that we can appreciate the same by means of a stronger contrast between light and shadow. But though these fine nuances are imperceptible at first glance, the general impression they produce is not for that reason lost. In part they appear as the spectator varies his point of view, and in part we derive from them what is essentially the impression of the organic continuity of all the members and their forms. This spirit of vitality, this soul of material configuration, is due wholly to the fact that, though every part is entirely complete in its separable independence, yet it is to a like extent throughout, by virtue of the wealth of its modes of transition, associated not merely with the part that is immediately its neighbour, but with the entire work. For this reason the form is vital in every part of it; the least detail of it is stamped with purpose; every part of it is differentiated from the rest, possesses that which distinguishes it and makes it distinct, and yet is affected by the same fluidity of treatment, is only what it is vitally as a part of the whole, so that we are able to recognize the whole in the very fragments of it, and a part that is broken off enables us not merely to see but to enjoy a totality that is not thus mutilated. The material surface, although for the most part statues are now seriously impaired by the weather and other causes in this respect, presents a soft and malleable appearance; and in one particular example of the head of a horse I have in mind it literally glows with the ardour of life on the face of the marble itself. This scarce perceptible undercurrent of fluidity in all organic parts, united to the most conscientious elaboration which avoids purely regular surfaces and anything approaching the bare convexity of circular shape, supplies that softness and ideality of all parts, that harmonious unity, which extends throughout the whole as the spiritual breath of one animating presence.

(*c*) However true, notwithstanding, expression of detailed or general configuration may be, this truth is no mere imitation of Nature simply. Sculpture is always occupied with the abstraction of form, and is consequently obliged, on the one hand, to omit from the bodily presentment what is most essentially the natural aspect, in other words, what is exclusively indicative of natural function. From a further point of view it is unable to carry to extremes its particularization of detail, but rather as, for example, in its treatment of hair, must restrict its attention and reproduction to the more general of its forms. In this way, apart from any other, the human figure, when properly treated by sculpture, is at once declared as the form and expression of Spirit, rather than of a purely natural form. Closely connected with this consideration is the fact that, though a spiritual content is expressed by means of sculpture in the *bodily* form, yet in the genuine Ideal it is not asserted so *prominently* in the exterior form to the extent of making that which is simply external in its charm and grace either the exclusive or predominant attraction to the spectator. On the contrary, though the genuine and more severe Ideal of Spirituality is here presented in bodily shape, and is exclusively thus presented by means of such shape and its expression, yet this configuration must equally appear to be without exception unified, supported and transfused by this ideal content. The swell of life, the malleability and bodily presence, or sensuous fulness and beauty of the bodily organism, must as little supply independently the object of the presentation, as what is individual in the spiritual presence can be carried to the length of expressing the more intimate and more closely related inner life of the spectator, when we consider his own particularity.

2. THE PARTICULAR ASPECTS OF THE IDEAL FORM OF SCULPTURE AS SUCH

If we direct our attention now to the more specific consideration of the fundamental phases, on which the ideal form of sculpture reposes, we shall do well to follow Winckelmann in essentials, who has laid stress on the several types with the finest intuitive sense, and with the most fortunate results, as well as on the way in which the same have been treated and shaped by Greek artists, with the result that they finally present to us the Ideal of sculpture. The vitality, this floating emanation no doubt evades the definitions of the understanding, which in the present case is unable to hold fast and transpierce the particular as in architecture, which, however, asserts itself in the entire work, as we have already seen, as the coalescence of free spirituality and bodily forms.

The first general feature of distinction which arrests us concerns the determination of works of sculpture in a general way, by virtue of which the human form has to express that which is spiritual. The spiritual expression, albeit it has to be poured forth over the entire bodily presence reaches its highest degree of concentration in the *facial form*, whereas the remaining members are merely able to reflect what is spiritual by means of their *position*, in so far, that is, as the same proceeds from Spirit in its essential freedom.

In our examination of these ideal forms we will make a beginning in the *first* place with the head; we will, then, in the *second* place enlarge upon the position of the body, after which we shall *conclude* with the principle of the drapery.

(*a*) In the ideal configuration of the human head we are first and foremost confronted with the so-called Greek profile.

(*α*) This profile consists in the peculiar union of the forehead and nose; in the almost straight or merely slightly crooked line in which the forehead unites without interruption with the nose, as also, to speak more accurately, in the vertical direction of this line to another which, extending it from the

root of the nose to the orifice of the ear, forms a right angle with the line of the forehead and nose above mentioned. In a line of this sort nose and forehead stand throughout to one another in the ideal and fine art of sculpture, and the question presents itself whether this is a merely national and artistic contingency or a physiological necessity.

Camper, the famous Dutch physiologist, has, with more exactness and in an exceptional way, characterized this line as the line of facial beauty; he in fact discovers therein the main distinction between the form of the human visage and the profile of animal life; and on account of this follows up the modifications of this feature throughout the various human races. In this respect his researches are no doubt in conflict with those of Blumenbach[156]. Speaking generally, however, the line adverted to is in fact a most marked means of distinction between the outward form of man and animal. Among animals, it is true, muzzle and nasal bone also form a more or less straight line, but the specific projection of the animal's snout, which is forced to the front, as being in the nearest practical relation to objects, is essentially determined through its connection with the skull, united to which the ear is moreover placed above or below, so that in the present instance the line that is carried forward from the skull to the root of the nose or the upper jaw, where the teeth are in position, forms an acute angle instead of a right angle as is found in the case of man. Everybody can independently feel in a general way the strength of this distinction, which no doubt opens the path to more definite thinking on the subject.

(*αα*) In the formation of the head of animals the most insistent feature is the mouth as the organ by means of which it feeds in co-operation with the upper and lower jaws, the teeth, and the muscles of mastication. All the other organs are subordinate and in a position of subservience to this principal feature. Notably the snout as a means of scenting food, the eyes being to a lesser degree instrumental in spying it out. The express insistence

on these animal features as exclusively devoted to the natural wants and their satisfaction gives to the head of the animal the appearance as though intended merely to satisfy natural functions without any trace of spiritual ideality. For this reason the entire animal organism is rendered intelligible from the mouth as a point of departure. A specific mode of nourishment, that is to say, requires a specific structure of the muzzle, a particular formation of the teeth, together with which the structure of the jaw bones, the muscles of mastication, cheek-bones, and, moreover, the vertebrae, the thighbones, claws, and so forth all stand in the closest relation. The body of the animal merely subserves natural ends and on account of this dependence on the purely material aspect of nourishment gives the impression of absence of spirit. If, then, the human countenance is, even in its bodily conformation, to possess a spiritual stamp, those organs which in the animal form are so predominant must in the case of man, retire from such a pre-eminence and give way to those which do not so much suggest a practical relation as one that is referable to the ideality of mind.

(*ββ*) The human countenance has consequently a *second* central point, in which that attitude to facts, which indicates the relation of the soul or spirit, is declared. We find this in the *upper* portion of the face, in the thoughtful brow and the eye, through which we face the soul, which looms out beneath it, together with its environment. Thought, reflection — that is, the introspection of the spiritual identity — is necessarily connected with the forehead, whose internal life in concentrated clarity looks forth from the eye. Through the prominence of the forehead and the correspondingly retreating appearance of the mouth and the cheek-bones the human countenance derives its *spiritual* character. This projection of the brow is therefore necessarily that which determines the entire formation of the skull, which no longer falls back, forming the side of an acute angle as its extreme point the mouth is pressed to the front[157], but rather permits of a

line being drawn from the forehead through the nose to the point of the chin, which, with a second drawn over the rear of the skull to the apex of the forehead, form a right angle, or one at least which approximates to it.

(*γγ*) *Thirdly*, we may say that the *nose* forms the passage and connection between the lower and upper portion of the face, that is to say, between the purely contemplative and spiritual forehead and the practical organ of nutrition; and if we take into consideration its natural function as the organ of smell it is rightly placed in this intermediate position between an attitude to the external world which is either wholly practical or ideal. No doubt the sense of smell in such a position is still associated with an animal want; it is intimately connected with the taste; and for this reason, in the case of the mere animal, the snout is at the service of the mouth and the organ of nourishment. But the sense of smell is by itself as a fact no actual consumption of objects, as eating and tasting are; it merely accepts the result of the process in which the objects pass into the atmosphere and its invisible and mysterious medium of dissolution. Assuming, then, that the passage from forehead and nose is of such a formation that the forehead viewed independently arches forward, and yet in relation to the nose retreats, whereas this latter organ on its part, in proximity to the forehead, is withdrawn back and only projects beyond this point, we see that both these portions of the face — that is, the contemplative part, the forehead, and that which suggests a practical use, with which we may associate the mouth, form an emphatic contrast, in virtue of which the nose, as belonging in a sense to both extremes, appertains equally to the practical aims[158] of the mouth. Furthermore, the forehead, in its isolated position, receives the appearance of severity and exclusive spiritual concentration in its contrast to the eloquent sympathy of the mouth, which is primarily the organ of nutritive support, and at the same time accepts the nasal organ into its service as its instrument in creating the natural want by virtue of its smell,

and thereby declares its direct relation to the material side. And in close connection with this reciprocity is the contingent character of the form to the indeterminable modifications of which both nose and forehead may be carried. The particular type of the forehead's arch, the nature of its projection or retreat, loses its secure lines of definition, and the nose can be fiat or fine, drooping, arched, more acutely flattened and a snub.

By virtue of amelioration[159] and accommodation, however, that beautiful harmony, which the Greek profile asserts in the gentle and uninterrupted communication between the spiritual forehead and the nose, that is, between the upper and lower portions of the face, the nose appears on this very account of closer affinity to the forehead, and consequently receives itself a spiritual expression and character as though drawn up into the spiritual system. The sense of smell becomes at the same time a sense independent of purely practical ends, a nose refined for spiritual purpose; just as in fact also the nose by its sneer and similar movements, however unimportant by themselves they may be, is nevertheless shown to be in the highest degree pliable as a mode of expressing the judgments and emotions of soul-life. So, for example, we say of a proud man that he holds his nose high, or ascribe sauciness to a young girl who tosses up her bit of a nose.

And the same thing may be said of the *mouth.* No doubt it is on the one hand referable as an instrument to the satisfaction of hunger and thirst; it expresses, however, in addition to this conditions of the soul, opinions, and passions. Even among animals it is used in this relation as the organ of animal cries, and by man as that of speech, laughter, sighs, and so forth, by which means the lineaments of the mouth are themselves associated with the facts of eloquent soul-sympathy, or of joy, sorrow, and similar conditions.

It is no doubt asserted that, though for the Greeks, such a configuration of the human countenance is presented as the true presentation of beauty,

the Chinese, Jews, and Egyptians, regarded on the contrary an entirely different type, or rather forms absolutely in conflict with such, as equally beautiful, or yet more beautiful, and the conclusion is made that, cancelling one example by another, we have not proved that the Greek profile is the type of genuine beauty. Such a statement, however, is wholly superficial. The Greek profile must in fact not be regarded as any mere external and accidental form, but approximates to the ideal of beauty by its independent claims, namely, first, because it is the type of countenance in which the expression of soul-life forces into the background all that is purely material, and, secondly, because it to the fullest extent detaches itself from all that is contingent in the form, without, however, displaying thereby mere subservience to rule, and leaving no place for every kind of individuality.

(*β*) With respect to specific types and their closer consideration I will merely touch upon certain fundamental aspects selected from the abundant material which otherwise invites attention. In this respect we may in the *first* instance refer to the forehead, the eye, and the ear, as those parts of the face which are most nearly related to the contemplative, or at least spiritual aspect, and, *secondly*, to the nose, mouth, and chin, as those relatively speaking more connected with the organs of practical import.

Thirdly, we shall have somewhat to say of the *hair* as the external setting, by virtue of which the head is rounded off in an oval shape of beauty.

(*αα*) The *forehead* is in the ideal form of classical sculpture, neither fully arched forward, nor as a rule lofty; for, although the spiritual aspect has to be prominently emphasized in its configuration of the visual features, yet it is not as yet spirituality simply as such, which sculpture has to present before us, but rather individuality as still exclusively expressed in bodily form.

In heads of Hercules, for example, the forehead is preferably low, for the reason that Hercules possesses rather the muscular vigour of the body directed towards external objects than the introspective energy of mind. And for the rest we find the forehead subject to many modifications, lower in the case of charming and youthful feminine forms, and more lofty in the case of figures that represent substantial character and serious reflection.

In speaking of the *eye* it is important at once to make it clear that in the figure of ideal sculpture, in addition to the absence of any true colour such as is found in painting, the *glance* of the eye is also absent. It is possible no doubt to show on historical evidence that the ancients, in the case of particular images of Minerva and other gods placed in temples, have painted the eye, since we find actual traces of colour in certain statues; in the case of images dedicated to a sacred purpose, however, artists have frequently held fast so far as possible to traditional usage in the face of good taste. In the case of other examples it is clear that they must have possessed eyes in the shape of precious stones inserted. This practice, however, is the result of a desire already adverted to of adorning the images of gods in as rich and lavish a manner as possible. And we may affirm generally that such either mark the beginnings of the art, or are due, as exceptions, to the traditions of religion. Moreover, apart from this, mere colour is still far from giving to the eye the essentially concentrated look, which alone communicates to it an expression that is wholly complete. We may therefore here assume it as a fact that in the case of statues and busts of a truly classical type, unaffected by such exceptional conditions which have come down to us from antiquity, the light focus of the eye, no less than the spiritual expression of its glance, is absent. For although not unfrequently the focus is inserted in the apple of the eye, or at least is indicated by a conical depression, and a modification which expresses the light point of this focus and by this means a kind of visual glance, such remains

nevertheless the purely external configuration of the eye-ball, and is no presentation of its vitality; in other words it is not the glance of it simply, the inward glance, that is, of the soul.

We can readily imagine that it must cost the artist a great deal to sacrifice the eye in its simple aspect of animation. We have only to look a man in the eyes to discover a point of arrest, a centre that explains and is basic to his entire presentment, which we may grasp in its simplest terms from the unifying declaration of its bare look. The eye-glance is in fact that aspect which is most steeped in soul; it is the concentration of the inward life and its subjective emotion. Just as a man by means of a handshake, so, too, with yet more rapidity he is brought into unity with his fellow by virtue of the eye-glance he faces. And it is this pre-eminently spiritual mode of revelation which sculpture is forced to dispense with. In painting, on the contrary, this outward expression of soul-life makes its appearance by means of the subtle gradations of colouring either in its entire spiritual effect, or in a manifest association with external facts and the particular interests, feelings, and passions, which are called up by their presence. But the province of the sculptor in his art is neither the essential inwardness of soul-life, the concentration of the entire man in the simple centre of self-identity, which gleams out in the human glance as its ultimate point of illumination, nor the developed subjectivity as we find it diffused amid the surrounding world. The end of sculpture is the totality of the external form, into which the soul must disintegrate itself, and present itself by means of the manifold of the medium thus utilized, so that the recourse to one simple soul-focus, in other word the immediacy of the spirit-glance, is not here permitted. The work of sculpture possesses no such ideal intimacy in its simplest terms which is allowed to assert itself, as the human look does assert itself in contrast to other parts of the human body, thereby unfolding a contrast between the eye and the body; rather in sculpture what the

individual is in his ideal and spiritual significance remains wholly fused in the total aspect of form, which the spirit that contemplates it, the spectator, can alone grasp in its unity. And in the *second* place, and with equal truth the eye peers into the world that surrounds it; it necessarily looks at something positive, and thereby is witness to man in his relation to a manifold world of objects, just as in the sphere of feeling he is united to his environment and general experience. It is, however, precisely this union with external objects from which the true figure of sculpture is withdrawn, being rather absorbed in what is substantive in its own spiritual content, essentially self-subsistent, that is without further diffusion or development. *Thirdly*, the glance of the eye receives its fully evolved significance by virtue of the expression of the rest of the bodily presentment, such as in its general mien and speech, albeit as the purely formal point of subjective life, in which the entire manifold of the form and its environment is concentrated to a focus, it holds itself aloof and contrasted with this development. A breadth of vision of this specific kind is, however, foreign to the plastic art. For this reason the more specialized mode of expression in the human vision, which did not at the same time immediately discover its further reciprocal response of effect in the entire compass of its configuration, could only be an accidental particularity, which the sculptured figure must dispense with. For reasons such as these, sculpture does not merely deprive itself of nothing when it leaves its figures bare of the eye's full glance; but we may affirm that it is only true to its fundamental principle when it totally disregards this mode of the soul's expression. Consequently it is merely one more example of the fine insight of antiquity, that it recognized firmly this limitation and restriction of sculpture, and remained loyal to the abstract view it implied. It is an evidence of the lofty intelligence of the ancients, based on the fulness of their reasoning faculties, and the comprehensive grasp of their outlook. No doubt we do meet with cases in antique sculpture,

in which the eyes gaze upon some definite point, as for example in the case of the faun we have alluded to several times who glances at the young Bacchus. This smile of recognition is expressed in a moving way; but even here the eye is itself visionless, and the real statues of the gods in their simple situations are not presented to us in relations of this specific character so far as the direction of eye and glance is concerned.

With regard to the *form* of the eye in ideal sculpture it is large of size, widely extended, oval and in respect to position placed at right angles toward the line of the forehead and nose, and in considerable depression. As far back as Winckelmann[160] the large size of the eye was accounted significant of beauty, just as a great light is more beautiful than a small one. "The size, however," his description continues, "is relative to the bone of the eye or its cavity, and is expressed in the mode of incision[161] and in the opening of the eyelids, of which in beautiful eyes the upper describes a more circular arch toward the angle within than the lower one." In the case of profile heads of superior workmanship the apple of the eye itself possesses a profile and receives precisely by virtue of this opening thus cut away a nobility and a free glance, whose very light, according to Winckelmann's observation, is rendered visible on coins through an exalted point or focus on the apple of the eye. At the same time mere size does not make all eyes beautiful; they are this in the first place by virtue of the cast of the eyelids, and in the second through being themselves deepset. In other words the eye ought not to press forward, and by so doing be thrust on the external world, for it is just this close relation to the external world which is removed from the ideal, exchanging for this the self-retirement of personality upon its own resources, that is, upon what is ideally substantive in the individuality. The projection of the eye, however, also suggests the thought that the apple of the eye is at one time pushed to the fore and at another withdrawn, and, particularly in the case of the staring gaze, only

testifies to the fact that the individual is beside himself, either staring in total absence of thought, or in an equally soulless way absorbed in the gaze upon some material object. In the Ideal of antique sculpture the eye is placed in even more pronounced retreat than we actually find it in Nature. Winckelmann suggests as a reason for this that in the case of statues of larger size which are placed more remote from the vision of the spectator, without this more receding position, on account of the fact that apart from this the apple of the eye was for the most part flat, the eye itself would have been without meaning and practically lifeless, if by just this more emphatic projection of the bone of the eye-socket, the thereby accentuated play of light and shadow had not made the eye more apparently active. Yet this deepening of the eye has a yet further significance. In other words, if the forehead is thereby suffered to receive a prominence superior to that of Nature the contemplative portion of the face is the predominant factor, and we receive a keener sense of spiritual expression, while also the emphasized shadow in the eye-sockets on its own account enables us to feel a depth and unimpaired inwardness, a look that is shut off from external objects, and retires on the essential presence of individuality, whose depths are suffused over the entire presentment. In the case of coins, too, of the best period the eyes are deep-set, and the enclosing bones of the eye are projected. The eye-brows on the contrary are not expressed by a more extended arch of tiny hairs, but merely suggested by means of the acute sharpness of the eye-bone ridge, which, without interrupting the forehead in its form of continuity as eye-brows actually do through their colour and relative elevation, surround the eyes as with an elliptical garland. The more elevated and consequently more independent arch of the eye-brows has never been regarded as beautiful.

Winckelmann[162] further observes with regard to the *ears* that the ancients devoted the greatest care to their elaboration, so that in the case of cut

stones indifferent attention to the execution of the ear is an infallible sign of the spuriousness of the work in question. In particular he insists that statues which are portraits often reproduced the characteristic and individual type of the ear. It is consequently possible in many cases to ascertain the very personality represented from the ear, if the same happens to be known, and to take one example, from a single ear with an exceptionally large opening into it, to deduce the presence of a Marcus Aurelius. Indeed, the ancients have not failed to indicate in this respect what is actually misshapen. As examples of a peculiar type of ear to be found in ideal heads, Winckelmann draws attention to certain ears given to Hercules, which are beaten out flat, and others which bulge out in their cartilaginous folds. They indicate wrestlers and pancratiasts, just as Hercules himself carried off the prize at Elis as a pancratiast in the games of Pelops.

(*ββ*) We have still to add some remarks with reference to that part of the countenance which is more nearly related to the practical or sensuous side of natural function, in other words the specific form of the nose, the mouth, and the chin. The distinction in the form of the nose gives to the face a variety of configuration and many various kinds of expression. A keenly cut nose with thin folds[163] at the apertures we are accustomed to associate with an acute understanding, whereas a broad and drooping one, or a snub nose that is somewhat brutish, suggests as a rule sensuality, folly, and bestiality. It is, however, the function of sculpture to hold itself aloof, not merely from such extremes, but also the intermediate stages of design and expression, and refuse consequently to accept, as we have already seen is the case with the Greek profile, not simply the separation from the forehead, but also the extreme curve, whether upwards or downwards, the acute point and the more extended rounding off, the elevation in the middle and the depression towards the forehead and the mouth, generally speaking the extreme acuteness and thickness of the nose, setting in the place of these varied

modifications a comparatively indifferent type, if at the same time one which in a quiet way is throughout vitalized by individuality.

Second only to the eye the *month* belongs to the most beautiful portion of the face, provided that it is formed not so much in express relation to its natural function as an organ for eating and drinking as in accommodation to its spiritual significance. In this respect it only gives place to the eye in the variety and wealth of its means of expression, and this though it is enabled to express with vital force the finest nuances of scorn, disdain, envy, the entire gamut of sorrows and joy through the slightest of movements and the fullest play of such, and to a similar degree to express the charm of love, earnestness, sensuous feeling, obstinacy, attraction, and other such emotions by its state of repose. Sculpture, however, makes less use of it to express the nuances of particular expression, and, above all, is bound to keep what is entirely sensuous, and suggests natural wants away from the form and delineation of the lips. For the most part, therefore, it models the mouth neither over-full-shaped nor too spare, for extremely thin lips also suggest a parsimony of emotional life; makes the underlip more full than the upper, which was also the case with Schiller, upon the modelling of whose mouth was inscribed every kind of significance and fulness of temperament. This more ideal type of the lips in its contrast to the animal snout presents the appearance of a certain absence of desire, whereas in the case of the beast, if the upper portion projects, we are at once reminded of the headlong devouring of food and the grasp for it. Among human beings the mouth is, when we have regard for its spiritual relation, primarily the seat of human speech, the organ for the free communication of self-conscious life, just as the eye is that of the emotional spirit. Moreover, according to the ideals of sculpture, the lips are not tightly closed; rather in the works of art in its blooming season the mouth is set slightly open without suffering the teeth, however, to be visible, which have nothing to do with the expression of a

spiritual significance. This attitude is so far supported by the fact that when the organs of sense are strongly active, as, for example, when we gaze intently at an object, the mouth is closed; when, on the contrary, we are absorbed in visionless thought it opens slightly and the angles of the mouth are to an appreciable extent inclined downwards.

Last in our review of the objects above named, the *chin*, in its ideal form, completes the spiritual expression of the mouth, that is, assuming it is not wholly absent, as in the case of animals, or only retained in a retreating and meagre condition as in works of Egyptian sculpture, but as rather lengthened out even beyond the degree which is usual, receiving thus in the rounded fulness of its arched curve, more particularly where we have shorter underlips, yet further increase of size. To sum up in fact a full chin conveys the impression of a certain satiety and repose. Odd fussy wenches wag with their withered-up chins and meagre muscles. Goethe, for example, likens their chops to a pair of tongs that will be snatching at something. All restlessness of this kind disappears with a full chin. The dimple, however, which nowadays is held to have some claim to beauty is, as an accidental grace itself, no essential accompaniment of beauty. In its place, however, a rounded chin of considerable proportions is an infallible sign of antique heads. In the case of the Medicean Venus it is not so noticeable, but it is proved on good evidence that the statue has suffered a loss in this respect.

(*γγ*) We have only now in conclusion to refer to the *hair*. Generally speaking the hair has rather the character of a vegetable than an animal formation; it testifies less to the strength of the organism than it is indicative of weakness. Barbarians allow the hair to hang in straight lines, or cut it off close to the head rather than in undulating line or locks. The ancients, on the contrary, devoted excessive attention to the elaboration of the hair in their ideal works of sculpture, a direction in which more modern artists devote less trouble and skill. No doubt the ancients also, when the stone on which

they worked was extremely hard, did not suffer the hair of the head to flow in freely hanging locks, but arranged as though it was cropped short[164] and, in that form, finely combed out. In the case of marble sculpture of the better time the hair is in locks and of great vigour both in the case of male and female heads, where we find it presented in upward rolls and bound together on the crown of the head; one finds it at least, as Winckelmann points out, drawn out in winding rolls and with express depressions the better to indicate its various folds in light and shadow, which is impossible if the drills are shallow. Add to this in the case of particular gods the line of direction and the arrangement of the hair is different In a similar way in Christian painting Christ is made recognizable by a definite type of the crown of the head and the locks of hair, following which type in our own time there are not a few who deliberately imitate such an appearance.

(*γ*) The parts above described in their form sum up collectively the head as a whole. The beautiful form is here determined by a line which most nearly approaches the oval of an egg, and thereby resolves every indication of sharpness, pointedness, and angularity in harmonious form and a gently progressive association, without, however, being exclusively regular and abstractly symmetrical, or issuing in multifold variety of lines and their direction and inclination as is the case with other portions of the body. In order to form this self-collected oval shape, the beautiful and free inclination from the chin to the ear contributes, particularly if we look at the face from the front, no less than the line already indicated, which describes the termination of the forehead, the bones of the eye-socket. And the arch over the profile from forehead over the point of the nose to the chin is equally noticeable, and the beautiful arching of the back of the head to the nape of the neck. So much I have permitted myself, without entering on further detail, to observe on the ideal shape of the head.

(*b*) In respect to the other organic members such as neck, breast, back, belly, arms, hands, thighs, and feet, we find here another type of co-ordination. They can no doubt possess a beautiful form, but the beauty is sensuous, vital, without expressing by virtue of their form as such a spiritual significance as the countenance expresses it. The ancients have shown for the form of these parts of the body the highest sense of beauty; but in genuine sculpture they must not merely pass as the beauty of a living organism, but as members of the *human* form it is their further function to present the appearance of a spiritual effect, so far as this is compatible with what is purely bodily presence. Otherwise the expression of the soul would be concentrated wholly in the face, whereas in plastic sculpture what is spiritual must appear as permeating nothing less than the entire configuration, and must not be permitted to isolate itself independently and in contrast to what is corporeal.

If we now inquire what are the means which enable the breast, the torso, the back, and the extremities to contribute to the expression of spirit and thereby to receive over and beyond a beautiful vitality, the breath of a spiritual life, we shall find the following:

In the *first* place there is the relation in which the limbs, in so far as that relation proceeds from the ideality of Spirit, and is freely determined by that ideality, are brought into juxtaposition.

Secondly, there is the motion and repose in their complete freedom and beauty of form.

Thirdly, this type of position and motion in their definite affiliation[165] and expression supplies the situation more closely, in which the Ideal, which can never consist purely in the Ideal of abstraction, is comprehended.

I will add yet further some general remarks on the above points.

(*α*) With regard to *position* of first importance is that aspect we have had already occasion to notice in a superficial way, namely, the *upright* position

of man. The body of animals moves in a parallel line with the ground; mouth and eye follow the same direction, and the animal is unable independently to raise himself from this relation to gravity. The opposite is the case with mankind; the eye looking straight forward is placed in its natural direction, that is, in a right angle with the line of gravity and the body. Man is no doubt able to go on all fours just as animals do, and children do so in fact; but as soon as consciousness begins to awaken, man wrests himself from the animal chains of the earth, and stands up straight in free independence. This stansion is an act of will, for if we cease to try to stand our body collapses and falls to the ground. In this way the upright position possesses a spiritual significance, in so far as the self-elevation from the ground remains linked with the volition and thus with that which is spiritual and ideal; just as we are accustomed to say of an essentially free and independent man, who keeps his opinions, view's, principles, and aims unaffected by others, that he stands on his own feet.

The upright position is, however, not yet merely as such beautiful; it is only so by virtue of the freedom of its form. In other words if a man stands up only straight in an abstract way, letting his hands fall glued to his side with no interval of separation, his legs in the same way being close to each other, we receive an untoward expression of stiffness, even although in the first instance this is due to no compulsion. From this stiff effect we deduce on the one hand the abstract and likewise architectonic principle of uniformity, under which the limbs adhere together in the like position, and on the other hand we do not discover in it any determination derived from what is spiritual and the ideal principle. In such a case arms, legs, breast, body, all the members stand and hang just as though they had from the first grown there on man, without being brought by means of his spirit, his volition and emotions into a change of position. The same thing may be said of the sitting posture. Conversely also the squatting or perching on the

ground is destitute of freedom for the reason that it suggests an attitude of subordination, dependence, and serfdom. The free position, on the contrary, avoids in a measure this abstract uniformity and angularity, and places the position under lines which approximate to the organic form; and to a further extent it suffers spiritual relations to shine through, so that by virtue of such a position the conditions and passions of the soul are cognizable. Only in this manner can the position pass as a genuine exhibition of Spirit.

In the application of positions as significant pose[166], it is necessary, however, that sculpture proceed with great circumspection, and it has thereby many a difficulty to overcome. On the one hand, no doubt, the reciprocal relation of the members is to be derived from the ideal principle of Spirit; on the other hand, however, this determination from the ideal side ought not to place the particular parts under a mode which contradicts the corporeal structure and the laws of the same, and thereby produce the impression of a constraint imposed on the members, or come into collision with the material of substance, in which sculpture is set the task to execute the artist's conceptions. And, in the third place, the pose must appear wholly spontaneous, as though the body received it of its own initiative, otherwise body and spirit have the appearance of being distinct and separable from each other, and are involved in the relative position of mere direction from one side and purely abstract obedience from the other, whereas both in sculpture ought rightly to constitute one and the same immediately congruent totality. This absence of constraint is here of the first importance. Spirit, as the ideal principle, must throughout transfuse the members, and these latter must in like degree essentially accept spirit and its determination as to the content of its own soul. As to the pose itself and its character, which we may empower to express the just attitude in ideal sculpture, we can readily infer from our previous exposition that it ought not be one wholly referable to change or instantaneous action. The

representation of sculpture must produce no effect such as is seen in the case where men, while in the art of motion and action, were turned to stone or frozen by means of Hüon's horn. On the contrary, it is necessary that the posture, although it may without question point to some characteristic action, express for all that merely a beginning and preparation, an intention, or it must indicate the close of an action and a return from the same to the state of repose. The repose and self-subsistency of a spiritual life, which potentially encloses in itself an entire world, is the most suitable aspect for the ideal form of sculpture.

(β) And, in the *second* place, what we have observed of posture is equally applicable to *motion.* There is in sculpture as such less room for motion in the full sense of the term than other arts[167], just in so far as the same does not as yet advance to the mode of presentation which is more nearly related to an art whose sphere of effect is more extensive. The tranquil image of the god in his blessed self-seclusion is the presentment which it is its task mainly to set before us in all its essential freedom from conflict. A variety of movement is necessarily excluded from such. What we ought to have is rather a stansion or reclining posture of essential self-absorption[168]. This attitude of self wholly referable to self it is which does not proceed to a definite action, and by doing so does not contract its entire energy to the space of a single moment, making such of first importance, but rather persists in the continued equilibrium of tranquillity. We ought to be able to imagine that the figure of the gods will remain for ever in the same posture. The escape from self-subsistency, the plunging of individual life within the vortex of a particular action that implies conflict, the strain of the moment, which is unable to continue as such — such relations are foreign to the ideality of sculpture. We cross them rather where, in the case of groups and reliefs, the particular moments of an action are presented with a distinct inclination to the principle of painting. A result brought about by

powerful effects, and their passing exhibition, no doubt exercises upon us an immediate impression; but after once having received it we do not readily return to it. For that which is so prominent in the presentation is the affair of a moment's passage, which we both observe and recognize in that moment, whereas the ideal fulness and freedom, what is infinite in its significance, in other words that which holds our attention permanently, is relegated to the background.

(*γ*) In asserting this, however, we do not maintain that sculpture, where, in the case where it adheres to its principle in all its severity and attains its highest point, must necessarily exclude entirely the attitude of movement. If it did so it would merely present to us the divine in its indeterminacy and indifference. On the contrary, in so far as it is its function to comprehend the substantive as individuality, and to present it to our vision in bodily form, both the ideal and external condition, in accordance with which it brings its content and form to an impression, is necessarily individual. And it is this individuality of a definite situation which is pre-eminently expressed by means of the pose and movement of the body. Inasmuch as, however, the substantive in sculpture is of most importance, and individuality is not as yet itself extricated from the same to the point of particular self-subsistency, the specific determinacy of the situation must not be of a kind that it impairs or annuls the simple sterling character[169] of that substantiveness, by either making it one-sided or drawing it into the conflict of collisions, or in a general way by placing it without reserve under the overmastering importance and variety of what is particular. It must rather remain, independently regarded, a determinacy less essential in its result, or rather we may say a vivacious play of vital force, harmless in effect over the superficial features of individuality, whose substantive character in no respect suffers loss thereby in depth, subsistency, and

repose. This is, however, a point which I have at an earlier stage of this investigation already[170] discussed at length in relation to the Ideal of sculpture when the situation itself was under review, in which the Ideal ought to appear in definite relation to the presentation: further discussion may here be consequently dispensed with.

(*c*) The last point of importance we have now to consider is the question of *drapery* in sculpture. At first sight it may appear as though the nude form and its corporeal beauty permeated by spiritual significance, in the manner of its pose and movement, were the most appropriate form for the Ideal of sculpture, and drapery were simply a hindrance. In accordance with such a view we hear the complaint raised, more particularly in our own time, that modern sculpture is so frequently forced to drape its figures, whereas no drapery should touch the beauty of human organic forms. And we have finally the wail added that our artists should have so little opportunity of studying the nude which was ever before the eyes of the ancients. In general we may simply reply to this that though without question, from the point of view of sensuous beauty, the preference must be given to the nude form, yet merely sensuous beauty is not the ultimate aim of sculpture, so that the Greeks do not give the lead to a false path when they presented the larger number of their male figures no doubt in the nude, but by far the greater number of female figures draped.

(*α*) And generally we may add that, apart from artistic purpose, drapery is justified in real measure in the necessity of providing a protection from climatic changes, Nature having failed to provide man with any covering of hide, feathers, hair, such as animals possess. And from another point of view it is the sense of modesty which compels man to cover himself with raiment. Now this shame, regarded in a general way, is a beginning of indignation over that which is coarse or crude. Man in fact, who is conscious of his more elevated calling to be Spirit, must necessarily regard

what is purely animal as an incompatibility with that, and pre-eminently seek to cover, as that which is not consonant with the Ideal of his soul[171], those parts of his body, such as the belly, breast, back, and legs, which are subservient to animal functions, or only are directed to external uses, and possess directly no spiritual determinacy, and no spiritual expression. We therefore find among every people, who have entered upon the life of reflection, this sense of shame and the necessity of clothing in some degree, whether great or small. As far back as the narrative of Genesis we have this transition expressed in the shrewdest way. Before Adam and Eve have eaten of the tree of knowledge they walk in Paradise in the nakedness of innocence; but no sooner is their consciousness as spiritual beings[172] aroused than they are ashamed of their nakedness. The same sense is prevalent among all other Asiatic nations. So, for example, Herodotus asserts in narrating[173] how Gyges came to the throne, that it was regarded even in a man as a matter of shame among the Lydians, and almost all barbarians, to be seen naked; and as a proof of this we have the tale of the wife of Candaules, king of the Lydians. The tale runs that Candaules exposed his wife in nudity to the gaze of Gyges, his satellite and favourite, in order to convince him that her beauty as a woman was beyond compare. She, however, discovered the outrage, which it was intended to conceal from her, by chance seeing Gyges, who had been hidden in her sleeping chamber, slip out of the door. Indignant at the outrage, she received Gyges in audience the following day, and declared to him that, inasmuch as the king had taken this step and permitted Gyges to see what he ought not to have seen, he might select one of two courses, either kill the king as his punishment, and possess himself both of her and the kingdom, or himself die. Gyges selected the first alternative, and after assassinating the king mounted the throne and married the widow. On the other hand the Egyptians represented frequently, or, indeed, for the most part, their statues

in the nude to the extent that the male figures merely carried an apron; and in the case of Isis the drapery was indicated by nothing more than a barely perceptible fringe round the legs. This, however, was neither due to a defective sense of shame, nor in virtue of their instinct for the beauty of organic forms. For if we consider their symbolic point of view we can only maintain that what concerned them was not the configuration of a presentment consonant with a spiritual significance, but rather the meaning, the essence and conception of that which the form was intended to present to intelligence; and they permitted the human form to be thus, without reflection upon the further and more remote adequacy of the same to Spirit, in its natural state, which they moreover copied with great closeness to life.

(*β*) Finally, among the Greeks, we meet with both aspects, both nude and draped figures. And in actual life also they were equally clothed, albeit from other considerations they held it a point of honour to have first contested in the games nude. To an exceptional degree the Lacedaemonians were the first to wrestle naked. But this was with them not due so much to a sense of beauty as to their general indifference to what savoured of refinement and spiritual purport in the sense of modesty. In the national character of the Greek people, among whom the feeling for personal individuality in all its immediacy, and as it is the spiritual animation of their existence, is so strongly developed, taking this as the instinct for free and beautiful forms, it was also inevitable that what was human in its immediacy, the bodily presence, that is, as it belongs to man and is suffused with his spirit, should be elaborated in independent form, and that the human form should be revered above all others for the reason that it is the freest and the most beautiful. In this sense, no doubt, they threw aside that instinct of shame, which will not suffer us to look at what is purely corporeal in' man, not out of indifference to what was spiritual, but with an indifference to what is

purely sensuous in desire, for the sake of beauty; and this intention is manifest in full play throughout a great number of their nude figures.

This entire absence of drapery, however, it was impossible wholly to justify on principle. For, as I have already indicated when distinguishing the head from other parts of the body, it is undeniable that the spiritual expression of the form is restricted to the face and the pose and movement of the whole, to the general mien, which is pre-eminently eloquent by virtue of the arms, hands, and position of the legs. For these organs, whose activity is in an outward direction, have still, and precisely by the nature of their pose and movement, for the most part the expression of a spiritual deliverance. The other members of the body, on the contrary, are and remain solely productive of a sensuous beauty; and the distinguishing features which are visible on them can only be bodily vigour, development of muscle, or degrees of delicacy and softness, such as characterize respectively the two sexes, age, youth, and childhood. As a means, therefore, of expressing what is spiritual in the form, the nudity of these parts is also from the standpoint of beauty indifferent; and it is only due to our moral sense, when, that is to say, the main thing looked for is the paramount presentation of the spiritual in man, that such parts should be veiled. What in general ideal art does in the case of every separate part of the body is to remove the necessary limitations of animal life in its detailed particularities, such as little veins, wrinkles, hairs of the skin, and so forth, and simply to enforce and emphasize the spiritual impression of the form in its vital outlines, and this is precisely what drapery effects. It covers up the superfluity of the organs, which are no doubt necessary for the body's self-support, but are in other respects superfluous as an expression of the spirit's import. We are, therefore, not entitled to assert without condition that the nudity of figures of sculpture in every respect betrays a higher sense of

beauty, and a greater ethical freedom and emaculacy. It was in this respect, as in others, that a just and spiritual instinct dominated the Greek.

Children, Cupid for example, where we find the bodily presentment one of unreserved innocence, and the spiritual beauty consisting just in this; or, to take other examples, youths, youthful gods, heroic gods, and heroes, such as Perseus, Hercules, Theseus, Jason, in which cases heroic courage, and the use and elaboration of the bodily frame in works of bodily strength and permanence is of most importance; or wrestlers in the national games, where it is not so much the content of the action, the spirit and individuality of character, as the physical aspect of the exploit, the vigour, suppleness, and free play of the muscles and limbs, which is the source of exclusive interest; or finally fauns and satyrs, Bacchantes in the frenzy of the dance, no less than Aphrodite, in so far as the sensuous charm of her beauty is emphasized — such are the kind of examples which were rendered in the nude by antique sculpture. Where, on the contrary, a more lofty significance and reflection, a more ideal earnestness is made prominent, where in general the natural features are not superlatively emphasized, there we get drapery. So Winckelmann adduces a case where among ten statues of the female form only one is wholly undraped. Among the goddesses Pallas, Juno, Vesta, Diana, Ceres and the Muses are pre-eminently those which are veiled in drapery, while among the gods such a treatment particularly applies to Jupiter, and the bearded Indian Bacchus, with some others.

(*γ*) And finally with regard to the principle of drapery, it is unquestionable that we have here a subject that critics are very fond of discussing, and which has consequently to some extent been already well thrashed out. I will, therefore, limit myself to the few following remarks.

Generally we have no reason to lament the fact that our modern feeling of what is respectable is somewhat averse to setting up totally nude figures. For if the drapery merely permits the pose in question to be entirely

transpicuous instead of covering it up, we lose nothing at all; rather the drapery is just that which rightly fixes the emphasis, and is in this respect even an advantage, in so far as it draws us aside from the direct view of that which as merely sensuous is without true significance, and simply shows us what is there in relation to the situation expressed by means of pose and movement.

(*αα*) Once accept this principle, and it may at first sight appear that such covering is of most signal advantage for the artistic treatment, which conceals the contour of the limbs, and consequently also the pose as little as possible, precisely in fact as this is the case with our sufficiently enclosing *modern* garments. Our closely fitting sleeves and trousers follow the outlines of the form, and stand in the way of the motion and mien least of all by their making the entire form of the limbs visible. The long white garments and bulging-out hoses of the Orientals, on the contrary, are intolerable to our sense of vivacity and multifarious activities, and are only fitting for folk who, like the Turks, sit the whole day long in one place with legs crossed, or only perambulate slowly and with great gravity. And yet we are conscious at the same time — indeed the very first glance at either modern statues or pictures will establish the truth for us — that our modern clothing is entirely unartistic. In other words what we behold in it really is, as I have already in another passage, insisted, not the fine, free, and vital outlines of the body in their tender and flowing elaboration, but stretched out sacks with stiff folds. For albeit we do obtain the most generalized form, yet the beauty of the organic undulations is lost; and what we really look at is a contrivance of exterior aim, a matter of tailor's work, which in one place is stitched together, in another folded back over, and yet in another made tightly fitting — in other words, as a whole, forms that are not free, folds and surfaces which are fastened together by stitch, buttons and button holes. To all intents and purposes such a clothing as this is simply a cover

and veil, which, while devoid of any real form of its own, yet in its other aspect, though in a general sort of way following the organic contour of limbs, hides from the view just that sensuous beauty and vital rondour and undulation which belongs to them, merely to replace it with the material aspect of the mechanically elaborated stuff of which it is composed. And thus we get what is so entirely inartistic in our modern form of garments.

(*ββ*) The principle for an artistic type of clothing, then, consists in this that it is at the same time treated as a work of architectonic design. Such a work is simply an environment, in which a man can likewise move in freedom, and which must essentially possess and declare on its part a determinate shape of its own as its mode of covering quite apart from the form which it encloses. Add to this such a work, in its aspect of a thing which is worn and carried, must freely follow its own mechanical texture. A principle of this type follows in the track of the kind of draping which we find adopted in the ideal sculpture of the ancients. Particularly here do we find that the mantle is as it were a house in which free motion is possible. It is no doubt carried, but is only made fast at one point, namely, on the shoulder. For the rest it evolves its particular form according to the modifications brought about by its own weight; it hangs, falls along the ground, and casts folds spontaneously, and only receives through the pose the varied changes of this free kind of configuration. In like manner there is little to impair essentially, if in varied degree, the freedom of disposition in other parts of antique drapery. This it is which constitutes its artistic quality. It is only in drapery such as this that we do not face something which is a burden, and something artificial, whose shape merely displays an external constraint and necessity, which is rather something itself independent in its form, and which, however, accepts from a spiritual source, that is the pose of the figure, its point of departure. For this reason the garments of the ancients are only fastened to the body so far as is actually unavoidable, that

is, to prevent their collapse, and are modified by the pose of it. In all other respects they hang freely about it, and themselves in their power of movement through the motion of the body give yet further support to the same principle. And this is wholly as it should be; for the body is one thing and its drapery another, and the latter ought thereby to receive its full due and be displayed in its freedom. Modern clothing on the contrary is either wholly carried by the body and purely in subjection to it, so that even the pose itself is too emphatically repeated, and it merely follows the forms of the limbs, or, in cases where it is able to secure an independent form in the formation of folds, it is after all merely the tailor's work who makes this form according to the exigences of fashion. The material is, on the one hand, dragged up and down by the various parts of the body and their movements, and, on the other, by its stitches and seams. On grounds of this description the antique form of drapery is by a long way to be preferred to our modern style as the ideal standard for works of sculpture. No end has been written with every resource of antiquarian research over the form and details of the ancient ways of draping, for although men as a rule do not permit themselves to chatter much over fashion in their clothes, the kind of cloth, border, cut, and every other such detail, yet they find ample justification from the antiquarian standpoint for treating these trifling matters also as important, and of talking about them with even greater prolixity than is permitted to woman herself in her unchallenged field of supremacy.

(*γγ*) It is, however, a totally different problem we have to consider when the question is asked whether modern clothing, that is, the kind so greatly to be contrasted with the antique, is in all cases to be rejected. This question is of particular importance when we examine the case of portrait statues; and inasmuch as its main interest closely touches a principle of importance to art as we have it now, we will consider it at rather greater length. When

nowadays we have to create a portrait of some contemporary it becomes necessarily a part of it that the drapery and the environment are both accepted from the actual facts of their individual existence, for, inasmuch as it is just this actual person which is here made the object of art, this external framework, to which the clothing essentially belongs, is in its reality and truth precisely that which is most important. And this is more especially to be observed when what is aimed at is the presentment before our vision in our individuality of well-defined characters whose greatness and activity in any *particular* sphere have been remarkable. Whether it be in a picture, or in the marble, an individual is, in fact, exhibited to our immediate vision in a bodily mode, in other words under external conditions, and to seek to carry the portrait beyond such a restriction would virtually imply the self-contradiction that the individual was associated with that which was essentially untrue, and this for the reason that the service, what is peculiar and distinguished in actual men, consists precisely in their active relations to the real, that is in their life and action in definite professional spheres. And if this individual activity is to be made clear to us the environment must exhibit nothing that is foreign to or tends to impair the effect. A famous general, for example, has lived in respect to his professional surroundings with cannon, rifles, and powder before his eyes. If we intend to depict him in his professional activity we recur most naturally to the way he gives orders to his adjutants, commands the line of battle, and advances against the enemy. And with yet more detail such a general is not merely one of a class, but is distinguished by the particular style of his uniform. He is either a leader of infantry or a stalwart hussar, and so forth. In every example of this kind we have some exceptional form of habiliment which is appropriate to the circumstances. Moreover a famous general is simply a famous general, not necessarily a law-giver, poet, or even very possibly a religious man; he commands in all respects as a soldier; he is just that; he is,

in a word, no complete totality, and this alone gives us the ideal and divine type. For the divinity of the ideal figures of sculpture is to be sought in nothing so much as this that their character and individuality are appertinent to no particular relations and professed callings, but are rather removed from such division, or, in the case that the idea of such relations is mooted, it is so placed before us that we are forced to believe about such individuals that their powers of performance are unlimited. For reasons such as the above a demand to represent the heroes of our time or the more recent Past, when their heroism is of a restricted nature, in ideal drapery is very superficial. Such a demand testifies no doubt to a zeal for artistic beauty, but a zeal which is unintelligent, and in its devotion to the antique overlooks the fact that the greatness of the ancients likewise reposes essentially in the lofty comprehension of all that they accomplished. In other words, they have, no doubt, represented what is essentially ideal, but they have not sought to enforce a form that is opposed to reality. If the entire content of the individuals in question is not of an ideal character, then their draping ought not to be such; and if a powerful, determined, and resolute general does not already possess a countenance indicative of the lineaments of Mars, then to drape him with Greek drapery would be as much a folly as though we popped a bearded man in a maiden's petticoats. Despite this truth, however, modern clothing does involve us in considerable difficulty because it is subject to fashion, and consequently subject to change. For the rational principle of fashion consists in this that it exercises over Time the claim to be always subject to modification. A robe, according to some particular cut, soon passes out of fashion, and it is only in fashion so long as it pleases. But when the fashion is over, we cease to be used to it, and what pleased us a few years back now appears suddenly ridiculous. For this reason only those forms of garments are appropriate for statues which carry the specific character of a period in a more permanent type; but, in general,

it may be advisable to find a middle way, as our artists attempt to do. Yet, despite of the rule, it is generally a mistake to clothe portrait statues in modern clothing when they are either small, or the object sought after is simply a familiar presentation. In such cases mere busts are best, which are the more easily lifted to an ideal elevation, simply neck and breast being retained, inasmuch as the head and the physiognomy thus remain of most importance, and everything else is relegated to incidental insignificance. Where we have large-sized statues on the contrary, more particularly where the pose is one of tranquillity, we see at once, because they are in repose, how they are draped; and large-sized male figures, even in the painted portrait, when clothed after modern wont can only with difficulty be raised over what is insignificant. As instances we may mention the full-figure seated portraits by old Tischbein of Herder and Wieland, of which we have excellent engravings on copper. One feels at once, when looking at them, that it is a somewhat stale, flat, and unprofitable business to gaze at their breeches, stockings, and shoes, and absolutely so to see their cosy, self-contented posture on a sofa, where they have their hands lying happily together over their paunches.

It is another matter with portrait statues of individuals where, either in respect to the period of their activity they are far removed from our own, or are themselves essentially of an ideal greatness. In such cases what is old is already divested of the temporal aspect and has passed into the more indefinite background of the general idea, so that in this release from its particular form of actuality it is also in the mode of its drapery capable of an ideal presentation. And this is still more true in the case of individuals, who by virtue of their self-subsistency and the ideal fulness of what are otherwise the mere limitations of their particular profession, and detached from what is merely the activity of a definite period of time, create independently for themselves a free totality, a world of relations and

activities, and consequently should appear, even in the aspect of their habiliments, as exalted above the familiar guise of every-day life in their ordinary temporal costume. As far back as the Greeks we find statues of Achilles and Alexander, on which the more individual traits of portraiture are of so fine a quality that we should rather imagine them to be sons of gods than human beings. In the case of the genial and greathearted youth Alexander this is quite as it should be. And in much the same way, moreover, Napoleon himself has been lifted to such a fame, and is a genius of so comprehensive a grasp, that there is no reason why he should not be depicted in ideal drapery, which indeed would not be unfitting for Frederick the Great, when the object is to celebrate him in all his greatness of soul. No doubt the size of the statues is here, too, of importance. In the case of small figures, which carry an air of familiarity, the three-cornered little hat of Napoleon is out of place no less than the famous uniform and the arms crossed over breast, and, if we desire to have before us the great Frederick as "old Fritz," we may have him pictured for us with hat and stick as we find him on tobacco boxes.

3. THE INDIVIDUALITY OF IDEAL FIGURES OF SCULPTURE

Hitherto we have considered the Ideal of sculpture in its general character and in the further aspect of the more detailed forms which distinguish it. We have *thirdly* only left us to emphasize the fact that the Ideals of sculpture, in so far as, in respect to their content, they have to manifest what is substantive in individualities, and in respect to their external form the human bodily shape, are also under the necessity of an advance in which the *particularity* of their presentation is differentiated, and an aggregate of specific individuals is thereby created, just as we already, in the classical type of art, recognize the embracing circle of the Greek gods. We may, no doubt, very possibly imagine to ourselves there can only be one *exemplum*

of the finest beauty and perfection, which may be, moreover, concentrated in its absolute completeness in one statue. Such a conception of one Ideal in its purity is deficient in insight and indeed ridiculous. For the beauty of the Ideal consists just in this, that it is no purely general form or standard, but essentially individuality, and consequently possesses both particularity and character. It is simply owing to this that vitality is imported into works of sculpture, and it is this[174] which expands the one abstract beauty, in a totality of essentially definite creations. Taken as a whole, however, this aggregate is, if we regard its content, one with marked limits; and the reason is that a number of categories, which we are, for example, accustomed to employ in our Christian outlook, fall absolutely away in the case of the genuine Ideal of sculpture. The ethical points of view and virtues, for example, such as were brought together by the Middle Ages and our modern world in a synthetical nexus of duties which yields to some modification, moreover, in every epoch, has no meaning at all when applied to the ideal gods of sculpture; it is simply absent from such a circle altogether. Consequently we can as little expect to find here the presentation of sacrifice, of egotism overcome, of the conflict, against what is sensuous, of the victory of chastity and so forth, as that of incommutable fidelity, of the honour and honesty of either man or woman, or of the expression of religious meekness, subjection, and blessedness in God. All these virtues, qualities, and conditions repose in part on the breach between what is spiritual and what is corporeal; and in part they retire altogether beyond what is of the body within, the intimate shrine of the soul, or betray the individual personal life in its separation from its entirely concrete and explicit substance, as also in its struggle to find again mediation in the same. Moreover, the circle of these veritable gods of sculpture is no doubt a totality, but, as we already discovered in our consideration of the classical type of art, it is, when we examine the distinguishing differences of its

notion, no stringently articulated and unified system. Moreover, the particular examples are every one of them to be distinguished from all the others in their essentially definite and self-exclusive individuality, albeit they are not thus set apart by virtue of the characteristics of a purely abstract mintage, but rather, on the contrary, include much which they share in common relatively to their ideal and divine substance.

We will now pass in review the distinctions above indicated under the following aspects:

First, we have to examine purely external marks, incidental attributes, style of drapery, style of armour, and such like, indications with the detail of which Winckelmann deals at exceptional length.

Secondly, we shall see how the most important differences do not merely consist in external marks and traits of this kind, but rather in the individual configuration and *habitus* of the entire figure. What is most important in this respect is the distinction of *age*, *sex*, no less than that of the *different sphere*, from which the works receive their content and form, whether they are the impressions of gods, heroes, satyrs, fawns, or such representations as reach their final dissolution in the attempt to render animal images.

And, *thirdly*, we propose to direct the attention on a *particular* example of each class, in the individual form of which sculpture elaborates these general differences. Here, no doubt, we are faced with a multiplicity of material, and can only permit ourselves to deduce parts of it by way of example, a province, too, as it moreover is which implies a large experience.

(*a*) In considering these *first* mere attributes and all such external accessories, the kind of ornament, armour, tools, vessels, and in general all that is associated with mere environment, we find that such things are of a very simple character in superior works of sculpture, and retained only in a temperate and restricted degree, so that we see little of them beyond what is

suggestive or sufficient to appeal to our minds. It is the independent figure, that is its expression and not outside accessories, which has to give us the spiritual significance and its manifestation. Conversely, however, marks of this kind are nevertheless necessary, in order to enable us to recognize the particular gods. In other words divinity in its universal guise, which is the source of the substantive part of the presentment in the case of each individual, asserts, by virtue of this very equality of ground-basis, close affinity between the expression of each example and also between the individual figures, so that every god is to this extent withdrawn from the aspect of his particularity, and can indeed further pass through other conditions and modes of expression, than would otherwise belong to them. For this reason we do not as a rule have set before us the particular characterization with complete seriousness; and it is frequently these external additions which exclusively make the particular god intelligible. Among these indicating marks I will allude briefly to the following.

(α) I have already discussed the real *attributes* when the classical type of art and its gods presented an opportunity. In sculpture the same lose yet more their self-subsistent, symbolical character, and merely retain the right to appear as the external presentation and form which is referable to simply one aspect of the specific gods, a presentment which is true to this extent or approximately so. Such marks are frequently borrowed from animal life, as for example when Zeus is represented with the eagle, Juno with the peacock, Bacchus with the tiger and panther, who are harnessed to his car, because, as Winckelmann observes[175], this animal is an exceptionally thirsty one, and, moreover, fond of wine; and in the like manner we have Venus with her hare. Other attributes are tools or utensils of some kind, which are related to activities and actions, which may be ascribed to any particular god by virtue of his or her specific individuality. So we have Bacchus depicted with the thyrsus wand, in order to entwine thereon the ivy-leaves

and garlands; or he receives a wreath of laurel leaves, to indicate him as victorious in his expedition to India, or a torch, with which he lighted Ceres home.

Accessories such as these, among which I have here, of course, only adduced the most famous examples, are an exceptional stimulus to the acuteness and learning of our professors, and carry them into a kind of commerce in trifles, which too frequently leads them out of bounds, and finds significance in things where there is really none. As an example we are assured that two famous sleeping female figures in the Vatican and the Villa Medici are representations of Cleopatra, simply because they have a bracelet in the shape of a viper, and to the vision of such archaeologists a serpent at once suggests the death of Cleopatra, much as it would suggest to a pious father of the church the original serpent who seduced Eve in Paradise. It was, however, a prevailing custom for Greek women to wear bracelets in serpent coils, and such bracelets in fact were called by that name. Consequently the just sense of Winckelmann[176] has long ago rejected this interpretation, and Visconti has finally recognized[177] them as figures of Ariadne, as she at lasts sinks to sleep after her sorrow at the departure of Theseus. Although in uncounted cases acuteness of this quality shows itself at fault in dealing with detail of this kind, and makes itself appear contemptible in its departure from such insignificant facts, yet unquestionably both research and criticism of apparently unimportant facts are necessary, because it is only thereby that we can arrive at the closer determination of a figure. Yet even here the difficulty crops up, that attributes no less than form, do not in all cases point our conclusions to one god, but may be shared in common by several. We have the vase, for example, not only associated with Jupiter, Apollo, Mercury, Aesculapius, but also with Ceres and Hygiaea. Several goddesses receive the ear of corn; we find the lily in the hand of Juno, Venus, and Hope; and even the

lightning is not the exclusive possession of Zeus, for it is shared by Pallas, who on her part again does not alone carry; the Aegis, but on equal terms with Zeus, Juno, and Apollo[178]. The source of the individual deities from a general significance of less determinate character which, they share itself is associated with ancient symbols, which were appertinent to this more general and consequently more widely shared nature.

(*β*) Accessories of this incidental nature are more in place with works which, already departing from the simple repose of the gods, represent actions, groups, or the series of figures such as we find on reliefs, and for this reason are able to make more extensive use of a variety of external indications and suggestions. On gifts dedicate to a devout purpose, which are frequent in all kinds of works of art and nowhere more frequent than, in the case of statuary, on statues of Olympic victors, but more particularly on coins and cut stones, the rich and prolific invention of the Greek found ample scope for the presence of symbolical references of this type, such as that to his city's locality and others like it.

(*γ*) Other signs are more removed from purely external significance, and penetrate deeper within the individuality of such deities. These themselves are a part of the particular type in question, and are an integrating factor in it. Among such we may mention the specific type of the drapery, armour, adornment of the hair, and other attire of a similar nature, in respect of which I must here content myself in elucidation with a few examples borrowed from Winckelmann, who exercised great acuteness in such matters. Among the several gods Zeus was pre-eminently recognizable by the general treatment of his hair, and our authority maintains[179], that any particular head can at once be determined as one intended for this deity or no by the hair over his forehead, or his beard, even though there be nothing else significant to arrest us. In other words he asserts that, "the hair is elevated in an outward curve on the brow, and its different divisions fall in a

narrow curve with broken lines[180] down again.” This type of hair-treatment was so rigorous, that we even find it persisted in among the sons and grandchildren of Zeus. So, for example, the head of Zeus is barely to be distinguished from that of Aesculapius in this respect, who consequently receives another kind of beard, more particularly over the upper lip, where the same is more depressed in its curve, whereas that of Zeus is rather folded over the angle of the mouth and intermingled with the beard on the chin. Winckelmann further recognizes the fine head of a statue in the Villa Medici, later in Florence, by means of the more curled beard, which, moreover, folds over the upper lip, and is of greater thickness, and must be distinguished from the heads of Zeus with their greater tendency to curled locks. Pallas, in direct contrast to Diana, wears her hair long, bound together in its downward fall from the head, and then beneath the fillet flowing in a series of locks. Diana, on the contrary, wears hers thrown up from all sides, and fastened in a knot on the crown of the head. The head of Ceres is up to the back portion covered with her veil. Add to this, in addition to the corn she carries, she holds a diadem as Juno does, in front of which, to quote our authority once more[181], the scattered hairs are thrown into a charming confusion, as though to suggest possibly her sorrow at the robbing of her daughter Proserpine. Individuality of the same kind is emphasized by other exterior means, as for example, when we recognize Pallas by her helmet and its particular shape, in her type of drapery and various other things.

(*b*) The truly vital individuality, however, in so far as it should find its mintage in sculpture by means of the spontaneous and beautiful bodily form, ought not to be asserted merely by such accessories as the external attributes or modes of things we have cited, but should be displayed no less in the form itself than in its expression. In attempting such an

individualization the fine insight and creative power of the Greek artist increased in proportion as the figures of their deities possessed a substantive basis of essentially the same kind, from which, without wholly departing from it, it was their task so to elaborate the characteristic individuality that this ground-root of their conception was still maintained as a wholly vital and present fact. Nothing invites our admiration so much in the best works of antique sculpture than the exquisite attention the artist directed to the task of bringing the smallest traits of the presentment and expression into harmony with the entire figure, an attention which is, in fact, the source of such a harmony.

(α) If we inquire further after general distinctions of main importance which assert themselves as the substantive bases in most direct relation to the more individual severation of the bodily forms and their expression we may note, *first*, the distinction of more youthful figures in contrast to those of more mature age. In the genuine Ideal, as I have already stated, every trait, every particular part of the figure is expressed; and, moreover, the direct line, which is taken straight forward, avoids the abstractly level surface precisely as the circular form avoids the geometrical circle; and instead of this the vital variety of lines and shapes is elaborated in the finest way throughout by the nuances of their transitional forms which unite them. In juvenile and youthful age the boundaries of forms are less noticeably fluent, and pass into each other so finely, that we may compare them, I borrow the simile from Winckelmann[182], with the surface of a sea unruffled by the wind, of which we may say that, although in continuous motion, it is still. In the case of more advanced age, however, such distinguishing features are more definitely emphasized, and have to be elaborated with more pronounced characterization. Consummate male figures consequently are more likely to please us at the first glance, because the expression is throughout more distinct, and we wonder more readily at the knowledge

and ability of the artist. Youthful examples appear more easy in their accomplishment because of their softness, and the smaller number of their distinguishing features. As a matter of fact, however, the opposite is the case. That is to say, in so far as "the forming of their parts in the interval between their first growth and their completion is permitted to be indefinite[183]," the joints, bones, sinews, muscles, are necessarily more delicate and tender, yet are none the less suggested. Antique art celebrates its triumph in just this fact, that even in its most delicate figures all parts throughout and their appropriate organization are somehow made perceptible in barely visible nuances of elevation and depression, by means of which the science and virtuosity of an artist is only followed by an observer whose research and attention is equally thorough. If, for example, to take the case of a delicate human figure, such as the youthful Apollo, the entire structure of the human body were not reproduced actually, and in all its essentials with consummate, if half veiled insight, the members might indeed appear well and fully rounded off, but they would be at the same time flaccid, without expression and variety, so that the entire effect could hardly satisfy. As a striking example of the distinction between the youthful body and a man's in mature age, we may adduce the sons and father in the Laocoon group.

Speaking generally the Greeks, in the representation of their deities, preferred the still youthful age, and even in heads and statues of Zeus and Neptune do not indicate old age.

(*β*) In the case of the *sex*, in which the figure is portrayed, the difference, that is, between male and female figures, we meet with a distinctive mark of still more importance. In general we may affirm of the latter what I have already briefly stated in the contrast drawn between the more youthful and more advanced age. The female figures are more tender and soft, the sinews and muscles, albeit they must be there, are less pronounced, the transitional

lines are more flowing and malleable, yet in the wide interval of expression from the point of quiet earnestness, greater severity of power and dignity to that of the most delicate charm and grace of the love attraction, there is room for the richest gradations and variety. We find a wealth of form equally great in the male figures, in the treatment of which we have, moreover, the expression of elaborate bodily strength and courage. The cheerful tone of delight, however, is shared by all, a blithesomeness and blessed indifference, which soars above all particularity, associated not unfrequently with a trait of tranquil sorrow, a kind of smile through tears, in which we neither have wholly smile nor tears.

There is not a marked line of distinction here between the masculine and feminine character, for the more youthful figures of Bacchus and Apollo frequently are fined out to the point of feminine delicacy and softness, nay, we even find representations of Hercules in which there is so much the appearance of a young woman's form that critics have confused him with Iole, his sweetheart. And it is not merely this point of transition but even the combination of the male and female figure, which the ancients have expressly represented in their hermaphrodites.

(*γ*) *Thirdly*, and in conclusion, there is the question as to the main distinctions which the figure of sculpture receives in order that it may be classed within one of the specific divisions of subject-matter which constitute the content of the ideal outlook on the world appropriate to this art.

The organic forms which sculpture can utilize generally in its plastic effort are on the one hand the forms of humanity, on the other those of *animal* life. In respect to the animal forms we have already seen that in the case of the more severe type of the art at its culminating perfection they will only be found as attributes associated with the divine form, as when we find a hind with the hunting Diana, or Zeus with an eagle. And the same thing

may be said of the panther, griffin, and similar figures. Apart from the genuine attributes animal forms are, however, accepted partly in combination with human shapes, and in part entirely by themselves. The extent, however, of such representations is of a limited character. Apart from figures of the roebuck it is above all the horse whose beauty and fiery animation obtains a recognition in plastic art, whether it be in union with the human form, or in its own free and independent shape. In fact, we find that the horse stands generally in a close relation to the courage, bravery, and dexterity of human heroism and heroic beauty, whereas other animals, such as the lion, which Hercules overcomes, and the wild boar, which Meleager kills, are objects of heroic deeds themselves, and consequently are entitled to a place within the circle of representation, when such are expanded in groups and reliefs where a freer field is admissible for situations of movement and action.

The *human* figure on its part, in so far as it is conceived in form and expression as pure Ideal, supplies the adequate form for the divine, which, being still in union with the sensuous material, is not capable of being concentrated in the simple unity of *one* God, and can merely embrace a *collective* whole of divine figures. And similarly, to put the matter conversely, the human, whether we regard it according to its form or its expression, cannot pass out of the province of human individuality, albeit the same is at one time brought into intimacy and union with the divine, and at another with the animal nature.

For these reasons sculpture is faced with various sources out of which it can select and elaborate its subject-matter, and which I will now review. The essentially central source is, as I have already several times indicated, the sphere of the *particular gods.* Their distinction from humanity pre-eminently consists in this, that as they, in respect to that which they express, appear essentially gathered up over and beyond the finitude of care and

mortal passion within a blessed repose and everlasting youth, so, too, their bodily shapes are not merely purified from the finite particularity of mankind, but they are further detached from everything which would suggest the needs and necessary limitations of sensuous life, without, however, losing their vitality. We have, for example, an object of human interest in the way a mother pacifies her child. The Greek goddesses, however, are always represented as childless. Juno, according to the myth, tosses the young Hercules from her, and the Milky Way is the result. To associate a son with the majestic spouse of Zeus was beneath the dignity of the antique point of view. Even Aphrodite does not appear in sculpture as mother. Cupid is no doubt very near to her, but scarcely in the sense of her child. In the same way Jupiter is nursed by a goat, and Romulus and Remus are suckled by a wolf. Among Egyptian and Hindoo representations, on the contrary, we find many, in which deities receive mother's milk from goddesses. Among Greek goddesses the maiden form is that which is pre-eminent, this being that which to the least extent asserts the purely natural functions of the wife.

The above constitutes an important contrast between classical art and romantic, in the latter of which maternal love is a leading subject. After the gods we find that sculpture deals with heroes and those figures which have both the human and animal form in their composition, such as centaurs, fauns, and satyrs.

The line of distinction between *heroes* and gods is a very fine one; and much the same interval separates them from ordinary human life. Winckelmann observes with regard to a Battus on a coin of Cyrene, "With a single glance of tender jollity we could make a Bacchus of it, and one trait of god-like greatness would leave us an Apollo." And yet even in such cases human forms, where the object is to envisage the force of the will and bodily strength, tend in certain directions to make for greatness; the artist

gave to the muscular development a vital activity and movement, and in violent actions set in motion all the springs of Nature's workmanship. Inasmuch as, however, we find the same hero subject to an entire series of conditions not merely distinct, but opposed to each other, the masculine forms here also frequently approximate to the feminine. This is, for example, the case where Achilles first appears among the maidens of Lycomedes. Here we do not find him in his full heroic strength such as he displays before Troy, but in drapery resembling that of a woman and a fascination of figure which almost conceals his sex. Hercules, too, is not always depicted in the gravity and power suggestive of the tedious labours which he performed, but in the milder impersonation of his service to Omphale, as also in the repose of his deification, and generally in a variety of situations. In other relations heroes possess the closest affinity for the figures of the deities themselves, Achilles for that of Mars, for instance; it is consequently only after the most profound study that we can recognize the specific meaning of a piece of statuary merely from the characterization without further suggestion from attributes. Really expert connoisseurs can, however, deduce the character and shape of the entire figure from isolated pieces and supply what is missing; from which fact we again are instructed to admire the fine insight and the consequential character the individualization of Greek art displays to us, whose masters knew how to preserve and execute even the smallest detail in consonance with the entire effect.

Coming now to *satyrs* and *fauns* we find in them made visible what is throughout excluded from the lofty Ideal of the gods, the needs of mankind, the jollity of life, sensuous pleasure, satisfaction of excessive desire, and the like. Yet we find in particular young satyrs and fauns so remarkable for the beauty in which they are represented by the ancients that, to adopt a phrase of Winckelmann[184], "Every example of such figures may be exchanged, if

we except the head, for a statue of Apollo, I refer to that one which is styled Sauroktonos, and possesses the same stansion of the legs." The heads of fauns and satyrs may be known by their pointed ears, their stiffly erected hair, and their little horns.

A *second* province of sculpture is occupied by what is *human simply.* In this we have above all else the beauty of human form as we find it set before us in its elaborate power and dexterity in the sacred games. Wrestlers, discoboli, and the like are its main subject-matter. In such productions sculpture proceeds in a way that is somewhat opposed to the mere portrait, in which department the ancients, even in cases where they actually copied *real* personages, still understood how to hold fast throughout to the principle of sculpture as we have come to know it.

The *last* field that sculpture makes its own is that of independent *animal* figures, more particularly lions, hounds, and some others. Here, too, the ancients did not fail to grasp, make vital in its individuality, and enforce the principle of sculpture, the substantive significance of form, and indeed attained to such a perfection that, to take one example, the cow of Myron has become more famous than all his other works. Goethe, in "Kunst und Alterthum[185]," has described it with great charm of style, and pre-eminently drawn attention to the fact that, as we have already seen, such as animal function as suckling is only presented by Greek art in the entirely animal world. He entirely sets on one side poetical conceits such as we find in ancient epigrams, and with acuteness confines his attention to the *naïveté* of the conception out of which this most familiar of artistic themes arises.

(*c*) In concluding this chapter we have now to refer a little more closely to the *particular* individuals, in the characterization and vitality of which the distinctions above mentioned are elaborated, that is to say, for the most part to the presentment of gods.

(α) However much, speaking generally — and we may no doubt seek to enforce our conviction in reference also to the spiritual deities of sculpture — this spiritual significance is at bottom the emancipation of individuality — and the remark applies to Ideals also according to the degree of their ideality and nobility — to that extent as individuals their distinction from one another is less marked. And the astonishing thing in the problem of sculpture, as solved by the Greeks, consisted just in this, that despite of the universality and ideality of their gods they have none the less preserved their individuality and lines of distinction; they have done so despite the fact that in certain directions we are conscious of the endeavour to eliminate hard-and-fast boundaries and to depict particular forms in their transitional state. If, moreover, we are inclined to regard individuality in a way that suggests definite traits as being appropriate to definite deities, much as the traits of a portrait are so, a fixed type will thereby necessarily appear to be substituted for a vital creation and art will suffer accordingly. But this is quite as little in accordance with the facts. On the contrary we find that their invention in such individualization and vitalization gained in subtlety just in proportion as a substantive type lay at the roots of the same.

(β) Again, in considering the particular deities, we are inevitably led to the conviction that one individual is of commanding influence in determining all these ideal figures. This supreme value and dignity Pheidias attached in an unrivalled degree to the form and expression of his Zeus, albeit the father of the gods and mankind, is set before us at the same time with a blithe and benignant look throned in serenity of mature age, that is not in the first flush of youth, without, however, on the other hand emphasizing in the least any harshness of form or suggesting the feebleness of age. The most obvious parallels in form and gesture with Zeus are his brothers Neptune and Pluto, whose interesting statues in Dresden, for example, despite all that they share with him, nevertheless retain a clear line

of distinction — Zeus himself, by virtue of the benignity of his lofty presence, Neptune, by virtue of his greater ruggedness, Pluto, who is a kindred type to the Egyptian Serapis, by virtue of his profounder gloom and melancholy.

Essentially more apart from Zeus are Bacchus and Apollo, Mars and Mercury, the first pair in their more youthful beauty and the greater delicacy of their figures, the second more masculine albeit beardless. Mercury, too, is more robust, more slender in shape, with exceptional fineness noticeable in the facial traits. Mars is not so much marked out from the others as Hercules might be in the strength of his muscles and other parts of his figure, but rather as a more youthful and beautiful hero of an ideal form.

Among the goddesses I will only refer to Juno, Pallas, Diana, and Aphrodite.

Just as Zeus among the masculine deities, so, too, Juno among the feminine displays in her figure and its expression the greatest dignity. The large circular-arched eyes are proud and commanding, in like manner, too, the mouth by which she is at once recognized more particularly in profile. Generally she presents the appearance of "a queen, who will rule, is to be revered and must awaken devotion[186]." Pallas, on the contrary, receives the expression of more austere maidenhood and chastity. Tenderness, love, and every kind of womanly weakness are kept away from her; her eyes are less expanded than those of Here, less emphatically arched and somewhat downcast in the tranquillity of reflection, just as her head is, which is not proudly erect as in the case of the spouse of Zeus, although it is armed with a helmet. A very similar type of maidenhood characterizes the figure of Diana. She is, however, endowed with a more fascinating quality, more lightly poised, more slender, albeit there is no self-conscious delight in her charm. She is not given the pose of tranquil observation, but is generally in motion, pressing forward as toward some object in her vision.

Finally we have Aphrodite, the goddess of beauty as such, who is, along with the Graces and the Hours, alone depicted by the Greek artists as undraped and even here subject to exceptions. In her case nudity is justified on the good ground that she expresses, above all, sensuous beauty and its conquest, grace, attractiveness, tenderness, elevated and tempered by spiritual qualities. Her eye, even in cases where a more grave and lofty expression is emphasized, is smaller than that of Pallas and Juno, not so much in length, but narrower by reason of the lower eyelid being slightly raised, by which means Love's yearning look is admirably expressed. She varies, however, very considerably in the type expressed. In some cases her pose is more serious and powerful; in others delicacy and tenderness are most insisted upon; her age, too, is sometimes that of maidenhood, at other of riper years. Winckelmann compares the Medicean Venus to a rose which blossoms in the fair light of its own colour at daybreak. Uranian Aphrodite is, on the contrary, indicated by a diadem which resembles that worn by Juno, and which Venus victrix also wears.

(*γ*) The discovery of this plastic individuality, whose entire expression is wholly elaborated through abstract form and nothing further, was in a like degree of consummate perfection peculiar to the Greeks and is due to religion itself. A more spiritual religion can rest satisfied with the contemplation and devotion of the soul, so that works of sculpture pass for it simply as so much luxury and superfluity. A religion so dependent on the sense vision as the Greek was must necessarily continue to create, inasmuch as for it this artistic production and invention is itself a religious activity and satisfaction, and for the people the sight of such works is not merely so much sight-seeing, but is part of their religion and soul-life. And in general the Greeks did everything with a public and universal aim in view, in which every man discovered his enjoyment, pride, and honour. In this public aspect the art of the Greeks is not merely an ornamental object, but a vital

thing that meets a really felt want, in much the same sort of way as that of painting in its most glorious season responded to the life of Venice. Only on grounds such as these can we find a rational explanation, if we consider the great difficulties which the technique of sculpture implies, for the host of sculptured figures, this forest of statues of every kind, which in their thousand and indeed thousands, were to be met with in *one* single city, in Elis, in Athens, in Corinth, and even in towns of lesser importance, and in the same way in the greater Greece beyond and the islands of the Cyclades.

CHAPTER III

DIFFERENT TYPES OF PRESENTMENT, MATERIAL, AND HISTORICAL STAGES IN THE EVOLUTION OF SCULPTURE.

WE HAVE HITHERTO in our inquiry in the first instance looked about us for the *general* determinants, out of which it is possible to develop the most adequate content for sculpture and the form which best responds to it. We discovered the classical Ideal supplied this content, so that in the *second* place we were called to establish the precise mode, in which sculpture among the particular arts is most readily adapted to give shape to this Ideal. Inasmuch as we found, moreover, that this Ideal is only to be comprehended in its essential import as *individuality*, not only did we find that the ideal outlook of the artist expand to a collective cyclus of ideal figures, but the external mode of representation and execution in actual works of art breaks up into *particular types* of sculpture. In this latter direction we have still several points of view left us to discuss as follows:

First, there is the manner of representation, which, in so far as actual execution is concerned, either creates single statues, or groups, until finally in the relief we are confronted with the step of transition to painting.

Secondly, there is the external medium, in which these distinctions are given actual effect to.

Thirdly, we have to deal with the historical stages of evolution, or the process within which works of art are executed in the various types and material.

1. THE SINGLE STATUE, THE GROUP AND THE RELIEF

Just as, in the case of architecture, we made an essential distinction between independent building and that which was subservient we may also here establish a similar dividing line in sculpture, that is between such works that have an independent position and those which rather contribute to architectural decoration. In the case of the first the environment is nothing more than an artificially prepared locality, whereas in the latter cases their relation to the building which they adorn is of the first importance, and does not merely determine the form of the work of sculpture, but in a large measure even its content. Speaking in a summary way we may assert in this respect that single statues are set up on their own account, while groups and *a fortiori* reliefs tend to lose this independence and are utilized by architecture for its own artistic purposes.

(*a*) As to the single statue their original function is that of sculpture generally, that is to supply temple images as they are set up in the shrine of the temple, and all that surrounds them is in direct association with them.

(*α*) In such a case sculpture retains its most adequate purity. It displays the figure of the god apart from all situation, in beautiful, unimpaired, and inactive tranquillity, or at least free, unmolested, without definite action and development, such as I have on several occasions depicted, that is, in unconstrained situations.

(*β*) The earliest departure from this austere loftiness consists in this that the entire pose suggests the beginning of an action, or the conclusion of the same, without the god-like repose being thereby disturbed, or the figure being presented as in struggle or conflict. We place under this type the famous Medicean Venus and the Belvedere Apollo. In the times of Lessing and Winckelmann the admiration of the critical world over these statues, as the highest Ideal of art, was unconditional; nowadays, since we have come to know works more vital and substantial in their configuration, and more profound in their expressive power, we must deduct somewhat from this

estimate; critics, in fact, place them in an age somewhat subsequent to the great period, an age in which the smoothness of their elaborate workmanship already suggests that to please is the main object, and the genuine grand and severe style is not persisted in. An English traveller goes so far as to say that the Apollo is “a theatrical coxcomb,” and while admitting that the Venus has extraordinary softness, sweetness, symmetry, and coy grace, yet only finds in this a spiritual quality that is wanting in much, a negative perfection, and — a good deal of insipidity. We may generally review that transition from the former more severe repose and holiness as follows. Sculpture is no doubt the art of lofty seriousness, but this elevated austerity of the gods, inasmuch as the same are no abstractions, but individual figures, brings with it the absolute blithesomeness, and thereby a reflex attitude to reality and finite life, in which the blithesomeness of the gods does not express the feeling of absorption in such finite content, but the feeling of reconciliation, of spiritual freedom and alertness.

(γ) In consequence of this Greek art is throughout permeated with all the blithesomeness of the Greek genius, and has found its satisfaction, delight, and an object for its activity in a countless number of gratifying situations. When it once had discovered a way from the constraint of the abstractions of its presentment to an appreciation of vital individuality, which is the unifying factor of the whole, its joy in all that is indicative of life and cheerfulness became a real thing, and artists became occupied with a great variety of subjects, which, without glancing aside at anything suggestive of pain, horror, distortion or injurious, fixed as its final limit unoffensive humanity and remained thus. The ancients have in this respect executed much of the greatest excellence. I will here only mention, among the many mythological subjects of playful, that is playful in the most innocent way, interest, the sports of Cupid, in which we already see a close approach to

the ordinary life of mankind, just as there were others in which the vitality of the presentment is the main interest, and indeed the very attempt to secure and execute such subject-matter itself contributes this blithesomeness and innocence to the effect. In this kind of way we may point out that the dice-players and satellite of Polycleitus were thought quite as highly of as his Argive statue of Here. The discus-throwers and racers of Myron were equally famous. How dear to this folk, too, and admired is that youth in a seated posture who extracts a thorn from his foot? There were many others of the same type of production in great measure merely by name. We are face to face with the fleeting moment of natural existence, which is here arrested for ever by the sculptor.

(*b*) Beginning with examples such as the above of a movement towards external objects, sculpture proceeds further in the representation of situations, conflicts, and actions yet more involved with motion, and at last arrives at the group. For with an increase of specific detail in the action we have placed before us the more concrete animation, which expands in contradiction, reactions, and thereby, too, in the presence of several figures essentially related and intertwined with each other.

(*α*) At first we have, however, merely tranquil juxtapositions, such as, for example, the two colossal horse-tamers, which are set up in Rome on Mount Cavallo, and indicate Castor and Pollux. The one statue is commonly ascribed to Pheidias, the other to Praxiteles. There is, however, no strong evidence for this, although the extraordinary excellence of conception, and the no less exquisite thoroughness of the execution justifies names as famous. Such are entirely independent groups, which as yet express no real action, or the result of it, and are wholly appropriate as representations of sculpture and public exposition before the Parthenon, where it appears they were originally placed.

(β) Sculpture, however, is equally occupied in the group with the presentment of situations, which have as their content conflicts, discordant actions, pain, and other similar conditions. In this direction, too, we can only speak highly of the genuine artistic insight of the Greeks, which did not set forth such groups independently, and by themselves, but brought them, for the reason that sculpture has already made a departure from its peculiar, that is to say its self-subsistent, province, into closer relation to architecture. The temple figure, that is the isolated statue, stood in unimpaired tranquillity and sacredness within the inner shrine. The external pediment, on the contrary, was decorated with groups which represented definite actions of the god, and consequently admitted of more animated movement in its elaboration. The famous group of Niobe and her children is of this type. The general form for the co-ordination of each part is determined by the space which the group in question had to fill. The principal figure stood in the middle, and was thus able to be the largest in size and most prominent. The rest according as they were placed in the direction of the acute angle of the gable-end had to submit to other postures, the limit being reached by that of a reclining figure.

Of other famous works I will here only mention the Laocoon group. It has now for over forty years been the object of much inquiry and controversy. In particular it has been regarded as a matter of real importance, whether Virgil in his description followed this work of sculpture, or the sculptor adopted his work to the scene depicted by Virgil, whether Laocoon here is actually crying out, and whether it is appropriate in a work of sculpture to attempt to express such a cry, and many more criticisms of this kind. Critics have worried themselves up and down with such matters of psychological interest for the simple reason that they have not as yet secured the sort of enthusiasm and critical acumen which Winckelmann possessed; and, moreover, arm-chair professors are more

readily disposed for such investigations for the reason that not unfrequently they have neither the opportunity granted them to see real works of art, nor the capacity to grasp them for what they are when they do so. The most essential thing which can occupy our attention in this group is this namely, that in the supreme pain, the supreme truth, the convulsive tension of the body, the distention of all the muscles, the noble aspect of beauty is still preserved, and the process has not been carried in the remotest degree to the extremes of grimace, distortion, and over-strain. Despite of this, however, the entire work belongs without doubt — we have only to consider its subject-matter, the artificiality of its co-ordinate grouping, the disposition of each posed figure and the type of its elaboration — to a much later period, which already seeks to pass beyond simple beauty and vitality by means of a deliberate obtrusion of science in the configuration and muscular development of the human body, and no less is anxious to please by refined excess in its executive elaboration. The step from the ingenuous ease and greatness of art to a mere mannerism is already taken.

(*γ*) Works of sculpture may be set forth in very various places, such as in the entrances to columned halls, forecourts, landings of staircases, niches, and so forth. It is just in this variety of local position and architectural setting, which, on its account too, is variously related to human circumstances and conditions, that the content and object of such works of art are for ever changing, approaching as such art does in the group yet more closely our humanity. It is, however, a serious defect to place groups that embody much movement and variety of figure on the top of a building without further background against the sky. In other words the colour of the sky may sometimes be gray, at others blue and dazzlingly bright, so that it is impossible to see the outlines of the figures. Yet these outlines, that is, the silhouette we find in them, is just what is most important; it is the main thing which we recognize, and which simply makes the rest intelligible. For

in the case of a group we find that many portions stand in front relatively to others, an arm before the trunk of the body, or one leg in front of another. Now the fact of distance alone disturbs the clearness and intelligible articulation of such parts, or at least tends to do this more emphatically than in the case of outlined portions which are independent. We have only to imagine a group depicted on a piece of paper in which certain parts of a figure are strongly and sharply indicated, while others on the contrary are marked with lines of less defined and arresting definition. This is precisely the effect of a statue's lines, and yet more those of groups, which have no other background but that of the sky; in the latter case we only see a sharply indicated silhouette, in which, so far as what is within the compass of that outline, only relatively weaker articulation is visible.

This is the reason that, to take an example near home, the Victory on the Brandenburg gate in Berlin not only affects us strongly by virtue of its simplicity and repose, but can be readily followed through its separate figures. The horses, in fact, stand far from each other, without either of them impairing the view of the other; and similarly the figure of Victory rises sufficiently high above them. Conversely the Apollo drawn in a car by griffins, which we have on the Opera House, is less satisfactory from this point of view, however artistic the entire conception and technical work may be in other respects. By the favour of a friend I saw these figures before they were taken from the workshop. The effect promised was noble. But as we see them now at such a height, we have far too much of one outline partly obscuring another, which in its turn is backed by something else, and consequently is less freely and clearly silhouetted than would be the case were all the figures silhouetted in their simple outlines[187]. The griffins, which necessarily, on account of their shorter legs, do not stand up either so highly or so freely as horses, have wings into the bargain, and

Apollo, too, has his tuft of hair and his lyre. All this detail is too much for the position, and only tends to make the outlines obscure.

(*c*) The final mode of representation, in which sculpture makes an important step in the direction of the principle of painting is the *relief*; in the first instance the high-relief, and after it the low-relief. The condition here is the surface, the figures standing on one and the same plane, so that the spatial totality of the figure, which is the point of departure of sculpture, more and more tends to disappear. The older form of relief, however, does not as yet approximate so closely to painting, which involves distinctions of perspective between the foreground and background, but rather holds fast to the surface or plane as such without permitting the different objects to project into or to retire within the distinctions of their spatial position by means of an artificial reduction of size. In the present case figures in profile are preferred, and they are placed side by side on an even surface. A simple treatment of this kind does not admit the content of complicated actions, but actions which in real life already adopt more or less of one and the same line of motion, processions of all kinds, whether those of sacrifice or Olympian victors or others. Add to this the relief is capable of the greatest variety of form. It not only fills up and decorates the friezes and walls of temples, but is attached to utensils of all kinds, sacrificial bowls, votive gifts, shells, goblets, urns, lamps, and so forth; it is the adornment of seats and tripods, and is closely allied to the skilled crafts. Here as nowhere else the ingenuity of invention receives the fullest scope in every kind of form and combination, and is no longer in position to retain the true object of independent sculpture.

2. THE MATERIAL OF SCULPTURE

We have, by our acceptance of the principle of individuality, which is fundamental to sculpture, been compelled not merely to emphasize in

separation the different provinces of the divine, human and natural, from which plastic art accepts its subject-matter, but also to classify the several modes of presentation in the single statue, group, or relief. In the same way we have to discover a like variety of division in the *material* which the artist can make use of in his works. For different kinds of content and mode of presentation are more particularly congenial to different kinds of sensuous material, and betray a secret attraction to and affinity with such.

By way of generalization I will merely here permit myself the remark that the ancients, in addition to the extraordinary excellence of their invention, equally excite our astonishment by reason of the amazing elaboration and versatility of their technical accomplishment. Both aspects present an equal difficulty in sculpture, because the means at hand here for such presentation are without the ideal many-sidedness, which is at the disposal of the other arts. Architecture is no doubt poorer still in this respect; but it is not her province to embody spirit in its vitality, or what is actually alive in Nature in a material which is by itself wholly inorganic. This elaborate dexterity in the absolutely consummate treatment of pure material is, however, bound up with the notion of the Ideal itself, for its very principle is a complete entrance into the sensuous concreteness and the blending together of the Ideal with its external mode of existence. The same principle is therefore once again asserted, where the Ideal attains its executed form and realization. In this respect we have no reason to wonder, when it is asserted that artists, in periods distinguished by great executive ability, either executed their works of marble in clay without models, or, if they had recourse to them, set about their work in a much freer and unconstrained manner than is the case in our own times, where, to put the fact bluntly, it only makes copies which are now executed in marble after originals carried out in the clay[188]. The old artists retained in fact the vital enthusiasm, which is always to a more or less extent lost in the case of

copies and replicas, although it is undeniable that now and again we meet with defective work in famous masterpieces, as, for example, eyes that are not of the same size, ears one of which is placed lower than the other, feet that are of unequal length and others of the same kind. They did not lay so much stress on the absolute precision of the compass in such things as ordinary production and art criticism, that mediocrity of talent which imagines itself so profound, is wont to do; and it can do little else.

(*a*) Among the different materials in which sculptors have executed images of gods, wood is one of the most ancient. A trunk, a post at the top of which a head can be indicated, such was the beginning. Among the earliest examples of the temple image many are of wood, but the material was also used even in the days of Pheidias. The colossal Minerva of Pheidias at Plataea was mainly carved from wood which was gilded, the head, hands, and feet being of marble[189]; Myron, too[190], executed a Hecate out of wood here with only one head and body, and no doubt for Aegina, where Hecate was most revered and a festival took place annually in her honour, a festival which the Aeginetans maintained the Thracian Orpheus had inaugurated for them.

Generally speaking, wood, when it is not covered over with gilding or some other precious material, by reason of its texture and the grain of it, appears too fine a material for works of importance and more appropriate to smaller figures, for which purpose it was frequently used in the Middle Ages, and is still thus utilized nowadays.

(*b*) Other materials of most importance are *ivory*, associated with *gold*, founded *bronze* and *marble.*

(*α*) As is well known, Pheidias employed ivory and gold for his masterpieces, such as his Olympian Zeus, and also for his famous colossal Athene in the Acropolis of Athens, who carried on her hand an image of Victory, itself being larger than life-size. The nude portions of the body

were made out of sheets of ivory, the drapery and mantle from gold plates, which could be removed. This type of workmanship in yellowish ivory and gold dates from a period in which statues were coloured, a kind of representation which steadily approximated to the one colour tone of bronze and marble. Ivory is an extremely pure material, smooth and without the granular character of marble, and, moreover, costly. And among the Athenians the costliness of the statues of their gods was itself of importance. The Pallas at Plataea had merely a superficial gilding, that at Athens solid metal plates. The statues had to be both of colossal size and of the richest material. Quatremère de Quincy has written a masterly work upon these works, upon the "toreutic" of the ancients. "Toreutic" — τορεύειν, τόρευμα — is primarily applicable to figures whose lines are brought out by engraving in metal, or cutting of some kind such as cut stones; one uses the expression, however, to indicate entire works or parts of entire works in metal, which are executed by means of moulds and the founder's art, that is, not by means of engraving, then, still more remotely from the original meaning, of superb figures on earthenware utensils, and finally in the widest sense of mouldings[191] on bronze. Quatremère's researches have particularly been directed to the technical aspect of the execution; he calculates what must have been the size of the plates made of elephants' tusks, and, among other things, how much space, in proportion to the gigantic dimensions of the figure, they would leave covered. From another point of view he is equally concerned to reproduce for us from the sketches, or other evidence[192] we possess from antiquity, a drawing of the seated figure of Zeus, and, most of all, the great chair with its rich decorations of bas-reliefs, and by so doing to give us in every respect some conception of the splendour and perfection of the work.

In the Middle Ages ivory is mainly used for smaller works of very varied character, such as Christ on the Cross and the Virgin Mary, or yet again for

drinking vessels with scenes of hunting and the like, in which cases ivory, on account of its smoothness and hardness, is in many respects preferable to wood.

(*β*) The material which was most favoured and most widely employed by the ancients was bronze, in the casting of which it attained a success of the highest mastery. Preeminently during the period of Myron and Polycletus it was the prevailing material utilized in statues of deities and other kinds of sculpture. The darker, less defined colour, the sheen, the smoothness of bronze generally, has not reached the abstract formality of the white marble, and it is at the same time warmed. The bronze which the ancients used was partly gold and silver, partly copper, varying considerably in the degrees of its component parts. The so-called bronze of Corinth is, for example, a composition unique of its kind which originated after the burning of Corinth from the almost incredible wealth of this city in statues and vessels of bronze. Mummius had many statues carried off on his ships; and the excellent man was so full of anxiety for their safe deliverance in Rome that he informed the captain that in case of loss he must recreate the same exactly or suffer, such was the threat, heavy punishment. In the founding of bronze the ancients attained an incredible mastery, by aid of which it was possible to them to cast it securely despite its extreme thinness. It is possible to regard such a feat as merely a matter of technical dexterity which is unconnected with true art. Every artist, however, works upon a certain material, and it is an essential quality of genius to be complete master of the same. Dexterity and adaptability in matters which concern the technique and instruments of its work constitute one distinct aspect of genius. On account of this virtuosity in the founder's art a work of sculpture in this medium involved a less expensive process, and was in the reach of a larger number than the chiselling out of marble statues. A second advantage, which the ancients were able to attain in casting their work in

bronze, was the purity thereby acquired, which they carried so far that their bronze statues did not require further enchasening, and consequently lost nothing of the finer marks of expression, which is almost inevitable where such a process is necessary. If we consider, then, the extraordinary number of works of art, which originated in this facility and mastery over technical matters, we cannot fail to be astonished and admit that the artistic sense for sculpture is a distinctive impulse and instinct of spirit, which can only, that is, in so overwhelming a degree, appear in one period and one people. In the whole of the Prussian State, for example, at the present time we can easily reckon up the number of bronze statues, the single bronze door of a church we find in Gnesen, and, with the exception of the standing figures of Blücher at Berlin and Breslau, and Luther at Wittenburg, we have merely a few more in Königsberg and Düsseldorf[193].

The very various tone and the infinite adaptability to form and fusibility of this material, which may accommodate itself to every kind of representation, gives to sculpture the pass into every conceivable variety of production, and makes its sensitive material suitable for a host of conceits, prettinesses, utensils, ornaments, and innocent trifles of all kinds. Marble, on the other hand, is limited in its suitability for the depicting of objects and their size; it is, for instance, possible to execute bas-reliefs in it of a certain size on urns and vases. It is, however, unsuitable for smaller objects. In the case of bronze, however, which is not merely cast into specific forms, but can also be beaten into shape and informed by the engraver's tools, there is hardly any type or size of representation which it does not command. We may here, by way of more definite example, instance the case of coinage minting. In this art, too, we find that the ancients executed masterworks of beauty, albeit in the technical aspect of the mere mintage[194] they stand as yet far behind our present elaboration of all that is mechanical in the design. The coins in fact were not really minted, but beaten but of pieces of metal

closely resembling a globular form. This department of the art attained its culmination in the time of Alexander. The coins of the Roman Empire have already deteriorated. In our own time Napoleon endeavoured to revive the beauty of antique work in his medals and coinage, and they are of great excellence. In other states, however, the mere worth of the metal and accurate weight is mainly important in the mintage of coin.

(γ) The last kind of material exceptionally favourable to sculpture is stone, which possesses independently the external aspect of consistency and permanence. The Egyptians long before chiselled out their sculptured colossi with a labour that spared no pains from the hardest granite, syenite and basalt. *Marble* is, however, most directly, as a material, in harmony with the aims of sculpture through its soft purity, whiteness, no less than by the absence of definite colour and the mildness of its sheen, and in particular possesses, by virtue of its granular texture and the soft interfusion of light which it carries, a great advantage over the chalk-like dead whiteness of gypsum, which is too bright, and easily kills with its glare the finer shadows. We find a distinct preference given to marble, only at a later epoch of the Greek school, that is during the period of Praxiteles and Scopas, who executed their most famous works in marble. Pheidias no doubt worked in marble, but for the most part only in the execution of head, hands, and feet. Myron and Polycletus mainly made use of bronze. Praxiteles and Scopas, on the other hand, appear to have sought to remove from sculpture that feature which is alien to its main principle, namely colour. No doubt it is undeniable that the beauty of the ideal of sculpture is capable of being embodied in bronze as in marble, with no diminution whatever of its purity. When, however, as was the case with Praxiteles and Scopas, art begins to approach the softer forms of grace and charm of figure, the marble asserts itself as the more congenial medium. For marble "encourages, by virtue of the transparency of its surface, a softness of

outline, its gentle articulation[195] and mild conjunction; add to this that the tender and artificial elaboration of consummate work always appears more clearly on the soft whiteness of stone than on bronze, however noble it may be, which, in proportion as the transition of green is beautifully gradated, makes the lustres and the reflections all the more disturbing to the effect of repose[196]." For the same reason the careful attention, which at this period was paid to effects of light and shade, whose nuances and gradations are more clearly marked by marble than by bronze, was a further reason why stone should be preferred to metal.

(*c*) In conclusion we ought to associate with the above more important kinds of material *precious stones* and *glass.*

The ancient gems, cameos and pastes are invaluable. They repeat in fact on the smallest scale, yet with consummate finish, the entire survey of sculpture, from the simple figure of a god, through all the varied forms of grouping to every possible kind of conceit in dainty delight and prettiness. Winckelmann, however, observes with regard to the Stosch collection[197]: "It was while looking at this that I was made aware of a truth, which afterwards became to me of great value in elucidating monuments, very difficult to understand; and the truth is this, that on cut stones, no less than on imposing works of sculpture, we very rarely come across events which took place after the Trojan war, or after the return of Odysseus to Ithaca, if we only except the one case of the Heracleidae and the descendants of Hercules; for in this latter case the limits of history and fable still overlap, and fable is the main subject of these artists. Only one example of the tale of the Heracleidae, however, is known to me personally." As for gems, the genuine and most consummately executed figures are of the greatest beauty, fine as the work of organic Nature, and may be inspected through a magnifying glass without any loss to the purity of their delineation. I refer to this fact in proof that the technique of art in such cases is almost an art of

intuition; the fineness is such that the artist is unable as the sculptor is to follow the work with his eyes, but is rather compelled to *feel after* it. He holds the stone which is made fast on wax against tiny sharp wheels which are made to spin by means of a flying-wheel, and in this way cuts out the forms. By this process what we have is a kind of instinctive sense, which takes in and directs so consummately the conception, the intention of line and drawing, that we can almost fancy ourselves to have before us in these stones, when one sees them properly illuminated, a relief work.

The work on cameos is to be contrasted with the above. These represent figures finely cut in out of the stone. The onyx was particularly utilized as material for this kind of work. In dealing with these, the ancients were expert in setting off to advantage and with taste the various strata, in particular the white and yellow-brown. Aemilius Paulus had a number of such stones and other trinkets carried to Rome.

In the representations which were depicted upon all this varied material the Greek artists adapted as the basis of their work no situations which were poetically conceived by themselves, but selected their subject-matter invariably, if we only except examples of Bacchanals and dances, from myths about the gods and sagas. Even in the case of urns and representations of events relative to deceased persons they had definite facts before them, which were associated with the individual, whom it was thought right to honour by reason of his decease. The direct allegory, in fact, does not belong to the genuine Ideal, but only becomes perspicuous in art's later development.

3. THE HISTORICAL EVOLUTION OF SCULPTURE

We have hitherto regarded sculpture as the most adequate expression of the classical Ideal. The Ideal, however, has not merely an intrinsic forward

development on its own account, by virtue of which it approximates to that which it is in virtue of its notion, and by doing so equally begins a forward movement beyond this absolute harmony with its own essential nature. Quite apart from this, as we have already seen in the second main division of this work during our review of the particular types of art as a process, it contains, putting on one side its mode of presentation under the symbolical type, a certain aspect pre-supposed, which it is bound to pass beyond in order generally to establish itself as Ideal, and moreover a further type of art, that is the romantic, from which it will once more pass away. Both types of art, the symbolical no less than the romantic, likewise seize upon the human figure as an element of their presentment, whose spatial outlines they adhere to, and consequently set forth as sculpture sets them forth. We have, therefore, when it is a question of drawing attention to the historical-development, not only to speak of Greek and Roman sculpture, but also Oriental and Christian. It was, however, the Egyptian people pre-eminently among all, among whom the *symbolical* type sums up the fundamental character of their art-production, who first began to associate with their deities the human figure as it emerges from a mode of existence that is purely natural, and for this reason it is mainly among them that we meet too with sculpture, inasmuch as they gave as a rule to their general outlook an artistic existence in that which was simply material. The sculpture of Christianity is of wider range and richer development. We do not merely refer here to its uniquely romantic character in the Middle Ages, but also to that further elaboration, in which we find it made an effort once again to approach more closely the principle of the classical Ideal, and establish that type most specifically consonant with sculpture.

I will in concluding the present section of my work in its entirety, and following the above general observations, add a few words, *first*, upon

Egyptian sculpture as contrasted with the Greek as the introductory stage of the true Ideal.

The characteristic elaboration of *Greek* sculpture makes our *second* stage, which closes with *Roman* sculpture. On the present occasion what will mainly concern us will be to survey the stage which precedes the really ideal mode of presentation, because we have already in our second chapter considered at length ideal sculpture.

Thirdly, we have merely left us to indicate briefly the principle of Christian sculpture. I can only undertake in this place to refer to it in the most general terms.

(*a*) When we have the intention to investigate on the soil of Greece the classical art of sculpture from the *historical* standpoint, we find ourselves already confronted with Egyptian art in the form of sculpture before we have arrived at our object; and we must add not merely is this so in regard to great works which bear witness to the highest technique and elaboration in an entirely unique artistic style, but as the point of departure and source for the forms of Greek plastic art. That this last result on the ground of historical fact amounts also to an external contact, an acceptance and an instruction to which Greek artists submitted, this must be left to the history of art to establish, whether it be in reference to the significance of figures of deities represented from the field of mythology, or to the particular methods of artistic treatment. The association between Greek and Egyptian ideas of the gods is a conviction set forth with proofs by Herodotus. Creuzer is of the view that we find this external association of these arts most clearly demonstrated on coins, and he lays exceptional stress on ancient Attic examples. He has showed me one in his own possession in which without question the face, a profile possessed quite the outline of the physiognomy of Egyptian figures in every respect[198]. We must, however, here leave this purely historical aspect to stand on its own merits, and confine ourselves to

the inquiry whether apart from it a more ideal and necessary bond of connection cannot be established. This bond of intrinsic causality we have already adverted to above. It is necessary that the art which is incomplete must precede the complete form of art, the Ideal, by means of the negation of which, that is by the stripping off of that aspect which adheres to it as a defect, the Ideal is first realized. In this respect unquestionably classical art is a *becoming* or a process, which, however, apart from it must necessarily possess an independent existence, inasmuch as *quâ* classical it must leave all deficiency, all the mere becoming behind it, and be essentially rounded in "completion." This process as such consists in this, that the form of the presentation first begins to run counter to the Ideal, and yet remains incapable of an ideal grasp, belonging as it does to the symbolical synthesis, which is unable to embody in union the universal aspect of the significance, and the individual embodiment as it appears to sense. That *Egyptian* sculpture possesses such a fundamental character, is the single point that I will now briefly touch upon.

(*α*) The primary fact that calls for attention is the deficiency we find here in ideal and creative *spontaneity*, despite the greatest technical perfection. The source of works of Greek sculpture is the vitality and freedom of the imagination, which builds up individual figures from the religious ideas which are prevalent, and in the individuality of this its production makes an actual fact of its own ideal outlook and classical perfection. The Egyptian figures of deities, on the contrary, receive an inherited[199] type. As Plato long ago observes[200], the representations were long before fixed by the priestly caste, and it was neither permitted to painter nor any master of sculpture to introduce novelty, nor indeed to invent anything at all, but to accept instead what was already among them and traditional; neither is such permission conceded now. We consequently find that what was made and fashioned, it may be myriads of years before (to allow oneself a hyperbolical expression

for the great number that is actual verity), is neither more beautiful nor more ugly than the work of to-day. The circumstance must also be associated with this scholastic accuracy, that in Egypt, as appears clear from Herodotus[201], artists did not enjoy the same respect as other citizens, but were forced with their children to defer to all who were not engaged in artistic work. Add to this art among the people was not followed according to natural inclination; the institution of caste was paramount, and the son walked after his father, not merely in the matter of profession, but also in the way in which he made himself efficient in his duties and his art. One man simply placed his feet in the steps of another, so that, as Winckelmann has already observed[202], "Not a soul appears to have left behind him a footmark, which he can appropriate as his own." Consequently art, when fully confronted with this enforced serfdom of Spirit — in conjunction with which the mobility of free and artistic genius, in other words, not the mere impulse after external honour and reward, but the more elevated impulse to be *artist*, is banished — maintained itself simply as the mere craftsman working in a purely mechanical and abstract way according to forms and rules ready to hand, rather than with the vision of the artist of his own individuality in his work, viewed in this way as his own unique creation.

(*β*) Coming now in the *second* place to the actual works of art, here, too, we may borrow from Winckelmann, whose descriptions attest once more his exceptional acuteness of observation and distinction, and whose account of the character of Egyptian sculpture is in its main lines as follows[203].

Speaking generally we may say that both grace and vitality, which are the result of the genuine sweep and balance of organic line, are absent from the entire figure and its detailed parts; the outlines are straight or in lines that show less deviation from it, the pose appears constrained and stiff, the feet are thrust close together, and in cases of figures in the upright position where one foot is placed before the other, both point in the same direction

instead of having the toes turned outwards. In the same way, in masculine figures, the arms hang down straight and glued to the body. Further, the hands, such is Winckelmann's view, are shaped much as we find them in men who possess hands not badly shaped originally, but deteriorated and neglected; feet, on the other hand, are too flat and spread out, the toes are of equal length and the little toe is neither crooked nor curved inwards: in other respects hands, nails, and toes are not badly shaped, although neither the joints of fingers nor toes are indicated. And similarly we may say of all the rest of the nude figure the muscles and bones are but slightly indicated, and the nerves and veins not at all. In short, so far as detail is concerned, despite the laborious and able execution, just that aspect of the elaboration is absent which alone communicates to the figure its true animation and vitality. The knees, however, bones, and elbows are traceable in relief, as we find them in Nature. Masculine figures are conspicuous for their exceptionally narrow waist above the hips. The backs of figures, on account of their position against columns and their being sculptured from one block with them, are not visible.

Together with this lack of mobility, which is not entirely due to the technical inferiority of the artists, but must be regarded as a result of their primitive conception of the figures of deities and their mysterious repose, is nearly associated the absence of any true situation and any sort or kind of action, which are asserted in sculpture by means of the position and motion of the hands and the demeanour and expression of delineation. No doubt we do find among Egyptian representations on obelisks and walls many figures in movement, but these are purely reliefs and are for the most part painted.

To add a few more examples of even more intimate detail, the eyes are not deeply set as in the Greek ideal, but are almost on a level with the forehead; they are flattened and extended obliquely. The eye-brows, eyelids, and rims of the lips are mainly suggested by the graver's lines, or the brows

are indicated by a stroke in relief, which extends as far as the temples and is at that point cut off angular wise. What we above all find wanting here is the projection of the forehead, and along with this, together with uncommonly high placed ears and arched noses, as is the rule with vulgar natures, we have the retreating form of cheekbones, which in contrast to other parts are strongly indicated and emphasized, whereas the chin is always retiring and small; the rigidly closed mouth, too, draws its corners in an outward rather than an under-ward direction, and the lips appear to be separated from each other by a mere slit. Speaking generally, then, such figures are not only wanting in freedom and vitality, but more than anything else the head fails to show us the expression of spiritual significance; the animal aspect is the prevailing one, and Spirit is not as yet suffered to appear in its self-poise and independence.

The execution of *animal* figures is, on the contrary, according to the same authority, carried through with much knowledge and an exquisite variety of gently gradated outlines and of parts that flow one into the other without a break. And if in the human figures spiritual life is not as yet liberated from the animal type and the interfusion of the Ideal with what is sensuous and of Nature on a new and free model is absent, yet we find here that the specifically symbolical significance of the human no less than the animal figures is directly expressed by means of sculpture in these embodiments of forms, in which human and animal shapes pass into one mysterious union.

(*γ*) Consequently the works of art, which carry on their face this character, remain at the stage where the breach between significance and form is not yet bridged over. For such a stage significance is still of main importance, and what is aimed at is rather the conception of that in its general aspect, than the vitalization of any one individual figure and the artistic enjoyment derived from such presentment. Sculpture proceeds here

from the genius of an entire people, about which we may on the one hand affirm, that it has in the first instance arrived at the point where the need of *imaginative* conception is disclosed; and it is satisfied to find that indicated in the work of art, which is present in the conception, and here of course is a conception which is *religious*. We are not therefore entitled, taking into consideration the great strides they have made in laborious activity upon and actual perfection in technical execution, to call the Egyptians uneducated in their sculpture merely on the ground that, despite all this, they did not as yet in great measure seek to attach truth, vitality, and beauty to their results, by virtue of which qualities the free work of art receives a soul. Doubtless from another point of view the Egyptians did advance beyond the mere idea and its necessary demand. They sought further to envisage and embody the same in human and animal forms, nay, they knew how to comprehend and set forth the forms, which they reproduced, clearly, without distortion and in their just relations. They failed, however, to impart to them the breath of vitality, which the human form in its natural state already possesses, and to infuse with them that more exalted life, by virtue of which an active and fluent motion of spirit could be expressed in a created image that was adequate to its significance. Their works rather attest a seriousness that is entirely lifeless, an unsolved riddle, so that the configuration does not so much embody their own individual ideality as permit us to surmise a further significance which is still alien to it. I will here only adduce one example, namely, the frequently recurring figure of Isis, holding Horus on her knees. Here we have, so far as externals are concerned, the same subject-matter that we meet with in Christian art as the Madonna and her Child. In the symmetrical, straight-lined, and immovable pose of the Egyptian example we discover, to quote a recent description[204], “neither a mother, nor a child; there is no trace of affection, smile, or endearment, in a word there is no real expression at all. Tranquil,

unperturbed, and immovable is this divine mother, who suckles her divine babe; or rather we have here neither goddess nor mother, nor son, nor god. It is simply the sensuous sign of a thought, which is capable of no result and no passion; it is not the genuine presentation of a real action, still less the just expression of a natural emotion."

And it is precisely this which constitutes the breach between signification and determinate being, which creates the absence of figurative expression in the artistic results of the Egyptian people. Their ideality or spiritual sense is still so imbruted, that it has no imperative desire to possess the precision bound up in a true and vital representation carried through with detailed accuracy, to which the onlooker has nothing to add, but may simply surrender himself to the attitude of reception and translation, because everything is already a gift of the artist. We must have a more lofty feeling of the individual's self-respect aroused than the Egyptians possessed, before we cease to be content with the indefinite and superficial features of art, and make valid in its products a claim to reason, science, motion, expression, soul, and beauty.

(*b*) We find this artistic self-consciousness, so far as sculpture is concerned, first wholly alive among the Greeks. By its presence all the defects of the Egyptian phase of art vanish. Yet in this further development we do not have to make a wide leap from the imperfections of a type of sculpture still symbolical to the perfected result of the classical Ideal. Rather the Ideal has, in its own distinctive province — I have noticed this more than once — although lifted to a higher range, to remove the defects whereby in the first instance its onward path of perfection is obstructed.

(*α*) I will here very briefly refer to *Aeginetan* and ancient *Etruscan* works of art as examples of such beginnings within the sphere itself of classical art. Both these stages, or rather styles, already pass beyond that point of view, which is satisfied, as was the case with Egypt, in repeating forms, we

will not say absolutely opposed to Nature, but at least forms that are lifeless, precisely as they have been received from others, and is further content to place before the imagination a figure, from which the same can abstract its own religious content and recover the same for memory, without, however, attempting to work it out under a mode, by virtue of which the work is made apparent as the individual conception and vitality of the artist himself.

But along with this and to the same degree this preliminary stage of ideal art fails as yet to force its way entirely to the true classical ground, and this, first, because it is still clearly constrained within the bonds of the type and therewith the lifeless; secondly, because though it makes an advance in the direction of vitality and motion, yet in the first instance all that it attains to is the vitality of what is wholly of *Nature*, rather than that beauty, whose animation is Spirit's own gift, and which manifests the life Spirit inseparably conjoint within the living presentment of its natural form, accepting the individual modifications of this fully completed union with equal impartiality from present vision of actual fact and the free creation of genius. It is only in recent times that we have obtained a more detailed knowledge of Aeginetan works of art, over which it has been a matter of controversy, whether they belonged to Greek art or no. In considering their artistic quality, as representations, we must at once make an essential distinction between the head and the rest of the body. The whole of the body, if we except the head, attests the most faithful apprehension and imitation of Nature. Even accidental features of the skin are copied and excellently executed with an extraordinary manipulation of the marble's surface; the muscles are set forth in full relief and the skeleton framework of the body well indicated; the figures are thickset in their severity of line[205], but are reflected with such knowledge of the human organism, that they appear alive to a limit of actual deception, ay, to an extent, so Wagner

assures us[206], that we are almost scared at the sight and hardly like to touch them.

On the other hand, in the execution of heads all attempt to represent Nature is abandoned. One uniform design of face is throughout apparent in all the heads despite every divergence of action, character, and situation; the noses are pointed; the forehead is still the retreating type, which fails to rise up straight and with freedom; the ears are set high in the head; the long slit eyes are flat and oblique; the closed mouth ends in corners which are pursed outwards; the cheeks are stretched flat-shaped; the chin, however, is strong and angular[207]. Of a similar uniformity is the form of the hair and the fall of the drapery, in which symmetry, a principle which is also uniquely conspicuous in the pose and groupings, and second to that, a peculiar kind of exquisiteness are the prevailing characteristics. This uniformity has been in part imputed to a lack of the sense of beauty in seizing national traits, and in part traced to the fact that reverence for the ancient traditions of an art still immature has fettered the hands of the artists. An artist, however, whose life is that of his personality, and who lives in his work, does not suffer his hands to be thus shackled; consequently we can only explain this type of work, associated as it is with great ability in other respects, by assuming some bondage of spirit, as yet not wholly conscious of its freedom and independence of its creative powers.

The pose of these figures is of the same kind of uniformity, not so much a quality of stiffness as uncouthness, lack of enthusiasm, and in a measure, where we have the attitudes of warriors, resembling what we sometimes find from artisans at their trade, such as the rough work of joiners with the plane[208].

The net result, which we gather from the above description, we may affirm to be that, however interesting they may be for the history of art, what is wanting in such works of art, in the conflict they disclose between

tradition and the imitation of Nature, is *spiritual* animation. For we must remember that, in accordance with what I have already explained in the second chapter of this part of my work, spiritual significance is exclusively expressed in the countenance and the pose of the figure. The other parts of the body no doubt indicate natural distinctions of soul, sex, and age, but what is spiritual in the full sense can only be reflected by the general pose. But it is precisely the traits of countenance and the posture which in Aeginetan sculpture is the relatively spiritless.

The *Etruscan* works of art, that is, such whose genuineness is fully authenticated by inscription, display the same imitation of Nature in a yet higher degree; they are, however, freer in their pose and facial characteristics, and, in fact, some of them approximate closely to the portrait. Winckelmann, for example[209], mentions the statue of a man which appears to be simply a portrait, though it would also appear to date from a later period of art. It is a man of life-size, representing some kind of orator, a magisterial, worthy sort of person. It is executed with an extraordinary spontaneity and naturalness both of pose and expression. Remarkable and significant it would indeed be, if we did not recollect that on Roman soil it is not the Ideal but actual and prosaic natural fact which is from the first at home.

(*β*) In the *second* place truly *ideal* sculpture, in order to reach the highest point of classical art, has above all, to abandon the mere type and the respect for what is traditional, and to give free scope to the principle of spontaneity in artistic production. It is alone possible to a freedom of this kind entirely to incorporate the significance in its generality in the individual presentment of the form; or, from another point of view, to elevate the sensuous forms to the high level of a true expression of their spiritual import. Only after doing this do we find the rigid and inflexible aspect which is native to the origins of the more ancient art, no less than the

emphatic prominence of the significance over the individuality, by means of which the content ought to be expressed, liberated as that vital creation, in which the bodily forms also on their part equally lose the abstract uniformity of a traditional, character, and an illusive realism, and by doing so move in the direction of the classical individuality, which quite as much makes, vital the universality of the form in the particularity of its object as, on the other hand, it makes the sensuousness and actuality of the same throughout interfused with the expression of a soul's inspiration[210]. A vitalization of this type affects not only the form, but also the pose, movement, drapery, grouping, in short every aspect of the sculptured figure to which I have already drawn attention. What here communicates unity are these two principles of universality and individualization. They have, however, not merely to be brought into harmony in respect to the spiritual content, but also in relation to the material form, before they can be participant in the indissoluble association which is the classical type in its full flavour. This identity, however, has itself a series of stages. In other words, under one extreme we find that the Ideal still somewhat inclines to the aspect of *loftiness* and severity, which it is true does not deprive the individual object of its living impulse and movement, yet does tend to concentrate it more securely under the lordship of the general type. At the other extreme we find that the universal aspect more and more tends to dissolve in the individual; and while it pays the penalty for doing so in loss of depth it can only replace this loss by further elaboration of this sensuous individuality. Consequently it descends from the heights to the lower levels of that which *gives pleasure*, is exquisite, blithesome, and displays the charm which flatters. Between these two there is a *further* phase, one, namely, which carries forward the severity of the first to increased individualization, without reaching that point where mere charm of aspect is held to be the supreme object.

(*γ*) *Thirdly*, in the art of *Rome* we have indications of the dissolution of classical sculpture. In this art it is no longer upon the true Ideal that the entire conception and execution depends. The poetry inherent in the vital action of Spirit, the breath and nobility of the soul apparent in the essentially perfected presentment, these peculiarly emphasized excellences of Greek plastic art disappear, and give place, as a rule, to a preference for portraiture studies. And this insistence on realistic truth in art is carried out in all possible modifications. Notwithstanding, this Roman sculpture maintains so lofty a position in this its own province, that it is only in so far as it withdraws from that which brings a work of art to its full perfection, in other words, the poetry of the Ideal in the true sense of the word, that it essentially falls behind Greek art.

(*c*) Fixing now our attention on *Christian* sculpture we shall find that the principle of artistic conception and its mode of embodiment is from the commencement one that does not so directly commend itself to the material and forms of sculpture as we find to be the case in the classical Ideal of the Greek imagination and art. The romantic Ideal in short is essentially concerned, as we discovered in the second portion of this work, with a personal withdrawal of the self into its own realm from the external world, with a self-absorbed individuality, which no doubt possesses its external reflection, but which permits this external appearance to issue independently from it in its aspect of particularity, without enforcing a fusion between it and its ideal and spiritual self. Pain, torture of body and soul, martyrdom and penance, death and resurrection, the personality of the individual soul, inner life, love, and emotional life in general — this characteristic content of the romantic imagination, in a religious sense, is no object, for which the external form taken simply for what it is in its spatial entirety, and the material which belongs to it in its more sensuous existence unrelated to ideality, can supply either a form that is wholly relevant to it, or

one similarly congruent with it. It is therefore not in romantic art sculpture contributes the fundamental type and the affiliating quality of membership in a system[211] to all the other arts as in Greece, but yields the palm in this respect to painting and music, as arts more adequate to express the life of the soul, distinct from the external world of particularity which is withdrawn from it. No doubt we find also in Christian art repeated examples of sculpture in wood, marble, bronze, and both silver and gold work, examples of the greatest excellence. Yet for all that sculpture is not here the art which, as in Greek art, is most fitted to reveal the Divine image. Religious romantic sculpture, on the contrary, is to a larger extent than in the case of the Greek, an embellishment of architecture. The saints are placed as a rule in the niches of towers and buttresses, or at the entrance doors. Likewise the birth, baptism, the histories of the passion and resurrection, and many other incidents in the life of Christ, the day of Judgment and so forth, accommodate themselves naturally by the multiplicity of their subject-matter to reliefs over church doors, on church walls, and stalls in the choir, and readily approximate to the character of arabesques. All such sculpture contains, for the reason that it is the life of the soul which is herein pre-eminently expressed, characteristics suggestive of the painter's art in a higher degree than is permitted in the plastic of ideal sculpture. And from another point of view, for the same reason, such a sculpture seizes more readily upon aspects of ordinary life, and therewith inclines to portraiture, which, as in the case of painting, it is quite prepared to associate with religious representations. The goose-seller, for example, in the Nürnberg marketplace, which is highly prized by Goethe and Meyer, is an ordinary rustic of very realistic appearance in bronze (it would be impossible in marble), who carries a goose under either arm to market. There are, too, the many sculptured figures, which we find upon the St. Sebaldus Church and on many other churches and buildings, especially

dating from the period previous to Peter Vischer, and which in their representation of religious subjects such as the Passion, make clear to us with great vividness this particular type of individualized form, expression, mien and attitude, more particularly in their reflection of every degree of sorrow.

As a rule, then, romantic sculpture, which has deviated only too frequently into every kind of confusion, remains most loyal to the genuine principle of plastic art in those cases where it approaches most nearly the Greek, and either is concerned to treat in the mode of sculpture ancient subject-matter, much as the ancients would have done, or to model the standing figures of heroes and kings, and portraits, with an intention to imitate the antique. This is exceptionally the case nowadays. Much of the most excellent work, however, has been accomplished by sculpture, even in the religious field. It is only necessary here to mention the name of Michelangelo. We can hardly admire sufficiently his dead Christ[212], of which we have a plaster cast in our Royal Museum. The authenticity of the sculptured figure of the Madonna in the Frauenkirche at Bruges, a consummate work, is disputed by certain critics. Speaking for myself, nothing has ever more impressed me than the tomb of the Count of Nassau at Breda[213]. The Count reposes with his lady, life-size figures both in alabaster, on a slab of black marble. At the angles of this are placed Regulus, Hannibal, Caesar, and a Roman warrior in a bowing posture, and they support above their heads a black slab similar to the one beneath. Could anything be more interesting than to see a character such as that of Caesar placed before our eyes by Michelangelo. Even when dealing with religious subjects the genius, the power of imagination, the force, thoroughness, boldness, in short all the extraordinary resources of this master tended, in the characteristic production of his art, to combine the plastic principle of the ancients with the type of intimate soul-life which we

find in romantic art. But as we have seen, the direction as a rule of the Christian emotion, where the religious point of view and idea are paramount, is not towards the classical form of ideality, which primarily and with highest results is the determinant factor of its sculpture.

From this point we may now fix the transition from sculpture to another principle of artistic apprehension and presentment, which requires for its realization another sensuous material. In classical sculpture it was the objective and *substantive* individuality in its human shape, which constituted the vital core, and the human form was placed thereby at such a lofty level, that it was in fact retained in its abstract simplicity as the beauty of form, and as such converted to the Divine image. Under such a one-sided aspect of content and representation man is not fully himself in his *concrete humanity.* The anthropomorphism of art remains in its incomplete state in ancient sculpture. For that which fails us here is humanity in its *objective universality*, a universality which we identify at the same time with the principle of *absolute personality*, quite as much as that aspect of it which in common parlance is called human, in other words the phase of *subjective singularity*, human weakness, contingency, caprice, immediate sense life, passion, and so forth, a phase or factor which must be taken up into that universality in order that the *entire individuality*, the subject of conscious life, that is, in its entire range, and in the infinite compass of its reality, may appear as the vital principle both of the mode of presentment and its content.

In classical sculpture one of these phasal aspects, that is the human from the side of immediate Nature, is in part only brought before us in animals, quasi-animals, fauns and the like, without being reflected back again into the personal life of soul, and stated as a negation of that; and also in some measure this type of sculpture only accepts the factor of particularity, only directs its interest to external things in the *pleasing style*, in the countless

sallies of delight and conceits, in which the antique plastic lives and moves. Owing to this we wholly fail to meet here the profundity and infinity which lies at the root of man's personal life, that inmost reconciliation of Spirit with the Absolute, that ideal union of humanity with the humanity of God. No doubt Christian sculpture is the instrument which makes visible the content which here enters the domain of art more consonant with the above disregarded principle. But it is precisely its modes of art's embodiment which expose to us the fact that sculpture is insufficient for such a content, that other modes of art will infallibly arise able to reach in very truth the mark which sculpture failed in its work to achieve. We may collectively unite these new arts under the title of the *romantic arts.* They are indeed the modes most adequate to express the romantic type of art.

[111] *Sein subjektives Fürsichseyn.* Subjective independence of material conditions. Self-consciousness.

[112] *Rückkehr in sich.* Into itself, its own ideal world of conscious thought and emotion.

[113] *In seine innerliche Subjektivität.* That is, what is essentially the world of soul. Spirit here stands for mind and *Gemüth* or emotional life.

[114] *Ein Sichzeichen des Geistes*, *i.e.*, are signs of itself which mind evolves in a mode of externality.

[115] Here called generically *Baukunst.*

[116] *Die plastische Deutlichkeit.*

[117] *Das subjektive Innere, i.e.*, spiritual experience of a personality.

[118] That is in comparison with the fully independent arts.

[119] That is to say it must be a distinct object of the senses.

[120] *In sich materiell particularisirt.* We see Hegel's false notions of the theory of colour influencing his expression. It is really false to say that sculpture has nothing to do with colour. Light and shadow

at least are necessary and colour is implied.

[121] That is, lets fall some of its aspects.

[122] *Das Gemüth.* Strictly the more emotional part.

[123] Between the extremes of architecture and poetry or music.

[124] Lit., “Without being manifested in its return to itself as ideal substance.”

[125] Unparticularized, that is in its essential experience.

[126] He explains this lower down. The concentrated point is in the flash of the eye. Perhaps here he merely refers to it generally.

[127] *Als Innerlichkeit.*

[128] This is only partially true of bronze, and any marble that has had weathering.

[129] By *grosse geistige Sinn* Hegel means no doubt more than “taste.” He refers to the deep-rooted instinct in the genius of the race.

[130] Meyer, “History of the Plastic Arts among the Greeks,” vol. I, p. 119.

[131] *Die acht plastische Mitte.* Hegel means that plastic art comes to its most important focus, as it were, between the arts that either incline too much to the material as in architecture, or to ideality as in poetry.

[132] *Näheren.*

[133] The reader must always bear in mind that Spirit (*Geist*) includes intelligence. It might no doubt in some places be better translated as “mind.”

[134] *Substantielle.* That is what is the concrete fulness of real spiritual content.

[135] *Als Subjekt.*

[136] *Besonderheit.* The isolated self of the *Aufklärung.*

[137] *Zufälligen Selbstischkeit.* Contingent selfness. The ego above described.

[138] *Ohne innere Subjektivität als solche.* That is, in the wholly abstract sense.

[139] *Begriff* appears to refer here to the notion of animal life generally, rather than the generic notion in its narrow sense.

[140] *Innern Strukture.* The structure that ideally motives the whole.

[141] *Dieses ideelle einfache Fürsichseyn des leiblichen.* Apparently this includes the vegetable world.

[142] *Macht sich.* That is an operative principle in the working out of.

[143] *Als Seele*, *i.e.*, in the narrow sense of the expression above defined.

[144] *Pathognomik*, *i.e.*, the science, that is, of the expression of the passions, together with that of their physiological aspect.

[145] Lit., contingent subjectivity.

[146] Hegel's expression *Mienen* is not easy to translate by a single English equivalent. It signifies the passing look — the general variety of facial expression as contrasted with the permanent expression of substantive character.

[147] *Den eigentlichen Mienen.* The definite aspects of the face which express relatively permanent states of soul-life.

[148] Persists in the line of direction of the Ideal.

[149] *Die schöne freie Nothwendigkeit.*

[150] By *Witzigkeit* I presume Hegel means oddity and funniness of every kind — perhaps "humorous eccentricity" would interpret it.

[151] I think this gives the sense, though the language is rather confused because his image is that of invention attaching itself to what is already presented rather than creating a form that is based on external suggestion.

[152] The celebrated courtesan. She entered the sea with dishevelled hair at a celebrated festival at Eleusis. She had a statue of gold at Delphi.

[153] *Eigentlich Vorstellung ist.*

[154] *Statarisch.* That is, modelled on historical associations or the results of former work; perhaps “eclectic” would be a better word.

[155] *Der geistige Ton.*

[156] *De varietate nationum*, § 60.

[157] As in savage animals.

[158] The word *system* is used, which is not readily translated in this context, though I have adopted the literal translation lower down.

[159] *Mildrung.* The softening of its severe lines.

[160] Werke, vol. IV, bk. 5, c. 5, § 20, p. 198.

[161] It is difficult to see what Hegel means exactly here by *Schnitte.* I suppose he means the external lines of the eye-socket.

[162] *L.c.* § 29.

[163] *Flügeln* must here refer to the orifices of the nose.

[164] Winck, *l.c.* § 37, p. 218.

[165] Hegel’s word is *habitus.* Customary attitude and mode of connection appears to be included.

[166] *Gebehrde*, a word somewhat difficult to translate here. It seems to combine the ideas of gesture and pose.

[167] The reference is, of course, to painting and indirectly to poetry.

[168] *Ein in sich versunkenes Dastehn oder Liegen.*

[169] *Gediegenheit.*

[170] See vol. I, pp. 268-272.

[171] *Das höhere Innere.*

[172] *Das geistige Bewusstseyn.*

[173] Her. I, *c.* 10.

[174] This vitality.

[175] Vol. V, bk. 2, p. 503.

[176] Vol. V, bk. 6, ch. 2, p. 56.

[177] Mus. Pio-Clement. Tom. 2, pp. 89-92.

[178] Winck., vol. II, p. 491.

[179] Vol. IV, bk. 5, ch. I, § 29.

[180] I am not sure what is exactly meant by *gekrümmt* here. The description is not very lucid.

[181] IV, 5, 2, § 10.

[182] Winck., vol. VII, p, 78.

[183] Winck., vol, VII, p. 80.

[184] Vol. IV, p. 78.

[185] Vol. II, § I.

[186] Winck., vol. IV, p. 116.

[187] Such is, I think, the general meaning, though the literal translation of the words *als den Figuren sämmtlich die Einfachheit abgeht* is not quite clear. I take the word *sämmtlich* to mean "taken

collectively as separate units.”

[188] Winck., Werk., vol. V, p. 389. Anmerk.

[189] Meyer’s *Gesch. der bild. Künste bei den Griechen*, vol. I, p. 60.

[190] Pausanias, II, 30.

[191] I presume this is the meaning of *Bildnerei.*

[192] I am not sure whether *Angaben* refers to actual sketches, or merely other evidence handed down.

[193] In the year 1829.

[194] That is in the accuracy of mechanical line as the result of machine.

[195] *Sanftes Verlaufen, i.e.*, passage from one plane surface to another. *Zusammen-stossen* appears to me the melting together of lines, *i.e.*, conjunction, fusion.

[196] Meyer’s *Gesch.*, vol. I, p. 279.

[197] Vol. III, Vorr. XXVII.

[198] That is in 1821.

[199] *Statarischen*, scholastic, eclectic.

[200] “De Leg.,” Lib. II, ed. Bekk., III, 2, p. 239.

[201] Herod, II, *c.* 167.

[202] Vol. III, bk. 2, ch. I, p. 74.

[203] Vol. III, bk. 2, ch. 2, pp. 77-84.

[204] “Cours d’Archéologie par Raoul-Rochette, 1-12me leçon,” Paris, 1828.

[205] I am not sure if this rightly gives the sense of the words *Die Gestalten bei strenger Zeichnung gedrungen.*

[206] Ueber die Aeg. Bildwerke mit kunstgesch. Anmerk. von Schelling, 1817.

[207] That is, it does not approach Egyptian type so nearly.

[208] Hegel's words mean this, I suppose, though the German is somewhat compressed and not very clear as it stands.

[209] Vol. III, ch. 2, § 10, p. 188 and Pl. VI, A.

[210] Hegel uses the unusual word *Begeistigung*, I presume somewhat in the sense of *Begeisterung*, signifying the personal inspiration of the artist.

[211] This appears to be the meaning of the difficult phrase that sculpture supplies *das gesammte Daseyn*, *i.e.*, is the affiliating link of the collective body. All the different arts are stamped with its characteristics.

[212] I presume the Pietà in St. Peter's.

[213] Hegel's "Vermisch. Schriften," vol. II, p. 561.

SUBSECTION III

THE ROMANTIC ARTS

THE SOURCE OF the general transition from sculpture to the other arts is, as we have seen, the principle of *subjectivity*, which now invades art's content and its manner of exposition. What we understand here by subjectivity is the notion of an intelligence which ideally exists in free independence, withdrawing itself from objective reality into its own more intimate domain, a conscious life which no longer concentrates itself with its corporeal attachment in a unity which is without division.

There follows from this transition, therefore, that dissolution, that dismemberment of the unity which is held together in the substantive and objective presence of sculpture, in the focus of its tranquillity and all-inclusive rondure and as such is apprehended in fusion. We may consider this breach from two points of view. On the one hand sculpture, in respect to its *content*, entwined what is substantive in Spirit directly with the individuality, which is as yet not self-introspective, in the exclusive unit of a personal consciousness, and treated thereby an *objective* unity in the sense in which objectivity suggests what is intrinsically infinite, immutable, true — that substantive aspect, in short, which has no part in mere caprice and singularity. And from another point of view sculpture failed to do more than discharge this spiritual content wholly within the corporeal frame as the vital and significant instrument of the same, and by doing so create a *new objective* unity in *that* meaning of the expression, under which objectivity, as contrasted with all that is wholly ideal and subjective, indicates real and external existence.

When we find, then, that these two aspects, at first thus reconciled in one another by sculpture, are separated, that which we call *self-introspective* spirituality is not merely placed in opposition to that which is *external*, but also, in the domain of what is *spiritual* throughout, what is substantive and objective in that medium, in so far as it no longer continues to be retained in what is substantial individuality simply, is dissevered from the vital particularity of the conscious life, and all these aspects which have been hitherto held together in perfect fusion are relatively to each other and independently free, so that they can be treated too by art as free in this very way.

1. If we examine the content, then, we have through the above process, on the one hand, the substantive being of what is spiritual, the world of truth and eternity, the *Divine* in fact, which however here, in accordance with the principle of particularity, is comprehended and realized by art as a subject of consciousness, or as personality, as the Absolute, which is self-conscious in the medium of its infinite spiritual substance, as God in His Spirit and Truth. And in contrast to Him we have asserted the worldly and *human* condition of soul-life, which, regarded now as no longer in direct union with the intrinsic substance of Spirit, can unfold itself in all the fulness of that particularity which is simply human, and thereby permits the heart of man wherever and whenever represented[214], the entire wealth of our human mortality, to be open to art's acceptance.

The meeting-ground upon which these two aspects once more coalesce is the principle of *subjectivity*, which is common to both. The Absolute is, in virtue of this, disclosed to us to the full extent a living, actual, and equally human subject of consciousness, as the human and finite conscious life, viewed as spiritual, makes vital and real the absolute substance and truth, or in other words simply the Divine Spirit. The new bond of unity which is thus secured no longer, however, supports the character of that former

immediacy, such as sculpture disclosed it; rather it is a union and reconciliation which asserts itself essentially as a mediation of opposed factors, and whose very notion makes its apprehension only possible in the realms of *the soul* and ideal life.

I have already, when the general subdivision of our science in its entire compass offered an opportunity for doing so, laid it down, that if the Ideal of sculpture sets forth in a sensuously present image the essential solidity[215] of the individuality of the God in the bodily form alone able to express that substance, the community thereupon essentially confronts such an object as the intelligent reflection of that unity. Spirit, however, that is wholly self-absorbed can only present the substance of Spirit under the mode of Spirit, in other words as a conscious subject, and receives thereby straightway the principle of the spiritual reconciliation of individual subjective life with God. As particular self, however, man also possesses his contingent natural existence, and a sphere of finite interests, needs, aims, and passions, whether it be more extensive or restricted, in which he is able to realize and satisfy his nature quite as much as he can in the same be absorbed in those ideas of God and the reconciliation with God.

2. *Secondly*, if we consider the aspect of the representation on its *external* side, we find that it is by virtue of its particularity at once self-subsistent and possesses a claim to stand forth in this independence, and this for the reason that the principle of subjectivity excludes that correspondence in its immediacy, and disallows to itself the absolute interfusion of the ideal and external aspects in every part and relation of it. For the subjective principle is here precisely that which comes to be, in self-subsistent seclusion, that inward life which retires from real or objective existence into the realm of the Ideal, the world of emotion, soul, heart, and contemplation[216]. This ideal life is manifested no doubt in its external form, under a mode, however, in which the external form itself appears, that is to

say it is *merely* the outer shell of a conscious subject that is growing *independently* within. The hard and fast association of the bodily form and the life of Spirit in classical sculpture is not therefore carried to the point of an all-dissolving unity[217] but in so light and slack a coalescence that both aspects, albeit neither is present without the other, preserve in this connection their separate independence relatively to the other, or at least, if a profounder union is really secured, the spiritual aspect as that inward principle, which asserts its presence over and beyond its suffusion with the objective or external material, becomes the essentially illuminating focus of all. And it results from this that, to promote the enhancement of this relatively increased self-subsistency of the objective and material aspect, — we have in our mind mainly, no doubt, the extreme case of the representation of external Nature and its objects, even in their isolated and most exclusive particularity, — yet even in such a case and despite all realism in the presentment it is necessary that such counterfeits should permit a reflection of the artist's soul to be visible on their face. They should in other words suffer us to see the sympathy of Spirit in the manner of their artistic realization, and therewith discover to us the life of soul, the ideal life which is the vital breath of their co-ordination, the penetration of man's emotional life itself into this extreme type of external environment.

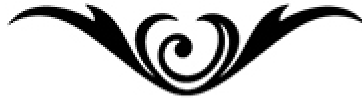
Speaking, then, generally, we may affirm that the principle of subjectivity carries with it as its inevitable result, on the one hand, that the wholly unconstrained union of Spirit with its corporeal frame should be given up, and the bodily aspect be asserted in a more or less negative relation over against the former, in order that the ideality of Spirit may be emphasized on the front of that external reality, and, on the other hand, in order to procure free scope for every separate feature of the variety, division, and movement of what is spiritual no less than what directly appeals to man's senses.

3. And, *thirdly*, this new principle has to establish itself in the sensuous material, of which art avails itself in its new manifestations.

(*a*) The material hitherto was matter simply, that is, the material of gravity in the content of its spatial extension, and no less was it form under its simplest and most abstract definition of configuration. Now that the *subjective* and at the same time the essentially particularized content of the soul is imported into this material, the spatial totality of such material will without question in some measure suffer loss in order that the former content may appear upon its face with its ideal mintage[218], and contrariwise will be converted from its immediately material guise to an appearance which is the product of *mind* or spirit; and, on the other hand, both in respect to form and its externally sensuous visibility, all the detail of what appears will be necessarily emphasized in the way that the new content requires. Art is, however, even now compelled in the first instance to move in the realm of the visible and sensuous, because, following the above course of our inquiry, though no doubt the inward or ideal is conceived as self-introspection[219], yet it has further to appear as a return of its own quality to itself from this very realm of *externality* and *material shape*, in short, as a return of itself to itself, which can only from the earliest point of view be portrayed in the objective existence of Nature and the corporeal existence of Spirit's life.

The *first* among the romantic arts will consequently have as its proper function to assert its content in the visible forms of the external human figure and the natural shape wherever disclosed, without, however, remaining bound to the sensuous ideality and abstract range of sculpture. This is the task and province of *painting*.

(*b*) In so far, however, as we find in painting for its fundamental type, not as in sculpture the entirely perfected resolution of the spiritual idea and the bodily form in one content, but rather the predominant exposition of the



self-absorbed ideality of soul, to that extent the spatial figure in extension is not a truly adequate medium of expression for the inward life of Spirit. Art therefore abandons the previous medium of configuration, and in the place of spatial forms employs the medium of *tone* in the limited duration of its sounds; tone in fact by its assertion of the material of Space under a purely negative relation secures for itself a finite existence nearer to ideality, and corresponds to that soul-life, which in accordance with its own inward experience conceives and grasps that life as emotion, and then expresses that content, as it enforces its claim in the unseen movement of heart and soul, in the procession of tones. The second art, therefore, which follows this principle of exposition is that of *music.*

(*c*) Thereby, however, music merely is placed at the opposite extreme, and, in contrast to the plastic arts, both in respect to its content and relatively to its sensuous material, and the mode of its expression, cleaves fast to the formless content of its pure ideality. It is, however, the function of art, in virtue of its essential notion, to disclose to the senses not *merely* the soul-life, but the manifestation and actuality of the same in its *external reality.* When, however, art has abandoned the process of veritably informing the real and consequently visible form of objective existence, and has applied its activity to the element itself of soul-life, the objective reality, to which it once more recurs, can no longer be the reality as such in itself, but one which is merely *imagined* and prefigured to the mind or sensitive soul. The presentment, moreover, as being the communication to Spirit of creative mind working in its own domain is compelled to use the *sensuous* material united to its disclosure simply as a mere means for such communication. It must consequently lower its denomination to that of a sign which of itself is without significance. It is at this point that *poetry* or the art of speech, confronts us, which now incorporates its art-productions in the medium of a speech elaborated to an instrument of artistic service,

precisely as intelligence already in ordinary speech makes intelligible to spiritual life all that it carries in itself. And, moreover, for the reason that it is able thus to unfold the *entire* content of Spirit in its own medium, it is the *universal* art, which belongs indifferently to all the types of art, and is only excluded in that case where the spiritual life which is still unrevealed to itself in its highest form of content is merely able to make itself aware of its own dim presentiments in the form and configuration of that which is external and alien to itself.

CHAPTER I

THE ART OF PAINTING

THE MOST ADEQUATE object of sculpture is the tranquil self-absorption of personality in its essential substance, the character whose spiritual individuality is in the fullest degree displayed on the face of its corporeal presentment, making the sensuous frame, which reveals this incorporation of spirit, adequate to such an embodiment of mind wholly in its aspects of external form. The sightless look has as yet failed to concentrate at one point the supreme focus of ideal life, the vital breath of soul, the heart of most intimate feeling, and is as yet without spiritual movement, without the deliberate distinction between a world without it and a life within. It is on account of this that the sculpture of the ancients leaves us in some degree unmoved. We either do not remain long before it, or our delay is rather due to a scientific investigation of the fine modifications of form and detail which it displays. We cannot blame mankind if they are unable to take the profound interest in fine works of sculpture which such works deserve. To know how to value them is a study in itself. At first glance we either experience no attraction, or are immediately conscious of the general character of the whole. To come to closer quarters we have first to discover what it is that continues to supply such an interest. An enjoyment, however, which is only the possible result of study, thought, learning, and a wide experience is not the immediate object of art. And, moreover, the essential demand we make that a character should develop, should pass into the field of action and affairs, and that the soul should thereby meet with divisions and-grow deeper, this, after all our journey in search of the delight which

this study of the works of antique sculpture may bring to us, remains unsatisfied. For this reason we inevitably feel more at home in painting. In other words we are at once and for the first time conscious in it of the principle of our finite and yet essentially infinite spiritual substance, the life and breath of our own existence; we contemplate in its pictures the very spark which works and is active in ourselves. The god of sculpture remains for sense-perception an object simply; in painting, on the contrary, the Divine appears as itself essentially the living subject of spiritual life, which comes into direct relations with the community, and makes it possible for each individual thereof to place himself in spiritual communion and reconcilement with Him. The substantive character of such a Divinity is not, as in sculpture, an individual that persists in the inflexible bond of its own limitations[220], but is one which expands into and is differentiated within the community itself.

The same principle generally differentiates the individual from his own bodily frame and external environment to quite as considerable an extent as it brings the soul into mediated relation with the same. Within the compass of this subjective differentiation — regarded as the independent assertion of human individuality as opposed to God, Nature, and the inward and external life of other persons, regarded also conversely as the most intimate relation, the most secure communion of God with the community, and of individual men with God, the environment of Nature and the infinite variety of the wants, purposes, passions, and activities of human existence — falls the entire movement and vitality, which sculpture, both in respect to its content and its means of contributing expression, suffers to escape; and it adds an immeasurable wealth of new material and a novel breadth and variety of artistic treatment which hitherto was absent. Briefly, then, this principle of subjectivity is on the one hand the basis of division, on the other a principle of mediation and synthesis, so that painting unites in one

and the same art what hitherto formed the subject-matter of two different arts, namely, the external environment, which architecture treated artistically, and the essentially spiritual form, which was elaborated by sculpture. Painting places its figures on the background of a Nature or an architectural environment, both of which are the products of its own invention in precisely the same sense, and is able to make this external material in both of these aspects by virtue of its emotional powers and soul a counterfeit within its ideal realm, in the degree that it understands how best to place it in relation and harmony with the spirit of the figures that live and move therein.

Such is the principle of the new advance that painting contributes to the representative powers of art.

If we inquire now the course which the more detailed examination of our subject necessitates the following division will serve us.

In the *first* place we shall have yet further to consider the *general character* which the art of painting must necessarily receive in accordance with its notion and relatively both to its specific content, the material that is made consonant with this content and finally the artistic treatment which is thereby involved.

Secondly, we have to develop the *separate* modes of definition, which are contained in the principle of such a content and manner of presentation, and more succinctly fix the boundaries of the subject-matter which is adapted to painting no less than the modes of its conception, composition, and technical qualities as painting.

Thirdly, painting is itself *broken up* into *distinct schools* of painting by reason of the above divisions of matter, technique, and so forth, which, as in the other arts, have their own phases of historical development.

1. GENERAL CHARACTER OF THE ART OF PAINTING

After having thus emphasized as the essential principle of painting that world of the soul in its vitality of feeling, conception, and action cast in embrace round heaven and earth, in the variety of its manifestations and external disclosures within the bodily frame, and affirmed on this account that the focus, and centre of this art is to be sought for in romantic and Christian art, it may immediately occur to the reader that not only do we find excellent artists among the ancients, who are as distinguished in this art as others of their age in sculpture — and we cannot praise them more highly — but also that other peoples, notably the Chinese, Hindoos, and Egyptians, have secured distinction in the direction of painting. Without question the art of painting is, by virtue of the variety of the objects treated and the particular type of its manner of execution, less[221] restricted in the range of nations that exemplify its pursuit. This, however, is not the point at issue. If our question is simply that of the historian doubtless we find single examples of one type[222] of painting or another have been produced at the most varied epochs by the nations already mentioned and others. It is, however, a profounder question altogether when we ask ourselves what is the *principle* of painting, examine the means of its exposition and in doing so seek to establish that content, which by virtue of its *own nature* is emphatically consonant with the *painter's art* as such and its mode of presentment, so that we can affirm the form thus selected to be wholly adequate to the content in question. We have but little left us of the painting of the ancient world, examples, in fact, which we see can neither have formed part of the most consummate work of antiquity in this respect, nor have been the product of its most famous masters. At least all that has been discovered through excavation in private houses is of this character. It is impossible, however, not to admire the delicacy of taste, the suitability of the objects, selected, the clearness of the grouping, and, we may add, the lightness of the handling and freshness of the colouring, excellences which

without doubt were present in the originals of such pictures in a far higher degree, in imitation of which, for example, the wall paintings in the so-called house of the tragedian at Pompeii have been executed. We have, unfortunately, no examples of the works of famous masters. Whatever degree of excellence, however, these more original productions attained, we may none the less affirm that the ancients could not, alongside of the unmatchable beauty of their sculptures, have lifted the art of painting to the level of artistic elaboration as painting which we find secured in the Christian era of the Middle Ages, and pre-eminently in the sixteenth and seventeenth centuries. And we may assume this to be so on the philosophical ground that the most genuine heart of the Greek outlook is, in a degree which is inapplicable to the other arts, concordant with the root and fragrance of that which sculpture and sculpture alone can supply. And in art we are not entitled to separate spiritual content from its mode of presentation. If, having this clear to our minds, we inquire how it is that painting only reached its most characteristic consummation through the content of the romantic type of art, we can but reply that it is precisely the intimacy of feeling, the blessedness[223] and pain that give to us the soul of this profounder content, whose demand is for such a vital infusion, which has paved the way to and in fact been the cause of this higher perfection of painting.

As an example of what I mean I will but recall to recollection one particular instance already cited, namely, that we borrow from Raoul-Rochette of the treatment of Isis carrying Horns on her knees. In general the subject is identical with the Madonna pictures, a Divine mother and her child. The difference of handling and conception in the two cases, however, is immeasurable. The Egyptian Isis, as we find her thus situated on bas-reliefs, has nothing maternal about her, no tenderness, no trait of soul or emotion, such as is not even wholly absent in the stiffer Byzantine pictures

of the Madonna. And if we think of Raphael, or any other great Italian master, what results have they not achieved from this subject of the Mother and Christ-babe! What depth of emotion, what spiritual life, what intimacy and wealth of heart, what exaltation and endearment, how human and yet how entirely filled with divine spirit is the soul which speaks to us from every line and feature. And under what infinite variety of forms and situations is this one subject presented to us even by particular masters taken singly and still more by different artists. The mother, the pure Virgin, the physical, the spiritual beauty, loftiness and devotion of love, all this and countless other features are emphasized in their turn as the main significance of the expression. But chief of all we find throughout that it is not the sensuous beauty of mere form, but the animate life of Spirit, by virtue of which artistic genius no less than mastery of execution is asserted and secured. Now it is quite true that Greek art has passed a long way beyond Egyptian art, and we may add that it has made the expression of man's soul an object aimed for. But it was not capable of grasping that intimacy and depth of emotion which is discovered to us in the Christian type of expression, and indeed was careful, in accordance with its entire character, not to attach itself to such intensity of feeling. Take, for instance, the case I have more than once already cited of the faun, who carries the youthful Bacchus in his arms; it is, no doubt, expressive of extremely tender and amiable qualities. The nymphs are equally so who tend upon Bacchus, a situation which is depicted by a gem in a very beautiful group of figures. In such cases we have an analogous sentiment of unconstrained love for a child, equally free from passion and yearning; but, even putting on one side the maternal relation[224], the expression possesses in no respect the intimacy, the depth of soul, which confront us in Christian paintings. The ancients may very well have painted excellent portraits, but neither their way of conceiving natural fact, nor the point of view from which they regarded

human and divine conditions was of the kind that, in the case of painting, an infusion of soul-life could be expressed with such intimate intensity as was possible in Christian painting.

The demand of painting, however, for this more personal type of inspiration is a result of its very material. In other words, the sensuous medium in which it moves is an extension on pure surface, and the display of form by means of the use of *diversified* colours, by virtue of which process the objective shape, as we have it presented to the vision, is converted to an artificial illusion adopted by a spiritual agency[225] in the place of the actual form of fact. It is part of the principle of such a treatment of material that which is external should not ultimately retain its validity in its independent native existence, even in the modified form it takes as a vital product of human hands, but should in this form of realization be lowered as reality to a purely phenomenal reflex of the *inward* soul-life itself, which seeks to contemplate itself independently as such. When we look into the heart of the matter we shall find that the advance from the rounded form of sculpture amounts to nothing less than the above statement. It is the soul-life, the ideality of Spirit which undertakes to express itself in an intimate way through the counterfeit of the objective world. Add to this, in the second place, that the surface on which the art of painting makes its objects visible, opens independently the path to the employment of a surrounding background and other complex relations; and colour too, regarded as the articulation of that which appears, requires a correspondent differentiation of soul-life, which can only be rendered clearly through the definition of expression, situation, and action, and consequently makes necessary variety, movement, and the detailed exposition of both the inward and external life. This principle of inwardness[226] taken alone, which at the same time in its actual manifestation is associated with the variety of external existence and is cognizable on the

face of such particular existence as an essentially complete and independent complex of conditions, we have already seen to be the principle of the romantic type of art, in whose configuration and mode of presentation consequently the medium of painting discovers in a unique way its *wholly adequate object.* Conversely we may affirm at the same time that romantic art, when the question is actually one of definite works of art, must seek for material which is consonant with its content, and in the first instance it finds such in painting, which consequently remains more or less of a formal character when dealing with all objects and compositions not of this type[227]. Granting, then, the fact that we find outside the Christian paintings an Oriental, Greek, and Roman school of painting, yet the real centre and focus of all is none the less the elaboration which this art secured within the boundaries of romantic art. We can only speak of Oriental and Greek painting in the same kind of way as we did when, despite our main thesis that sculpture attained its highest crown of perfection in the classical Ideal, we referred to a subordinate Christian type of sculpture. In other words we are forced to admit that the art of painting first apprehends its content in the material of the romantic type of art, which completely corresponds to its instruments and its modes, and consequently that it was only after the treatment of such material that it discovered how best to use and elaborate in every direction all the means at its disposal.

Following now the course of the above remarks in a wholly general way we have to observe as follows in connection with the *content*, *material*, and *artistic mode* of treatment of painting.

(*a*) The fundamental definition of the *content* of painting is, as we have seen, subjectivity as an independent process[228].

(*α*) In this process, looking at it from the point of view of a *reflex of soul-life*, individuality must not wholly pass into the universality its substance, but must on the contrary disclose how it retains that content as a distinctive

personality[229], and possesses and expresses its inward life, that is the vitality of its own conception and feeling in the same; neither should the external form be wholly dominated by the ideal individuality as is the case in sculpture. For the principle of subjectivity, albeit that it permeates the external material as the mode of objectivity adequate to express it, is notwithstanding likewise an identity which withdraws itself into itself out of that objective domain, and by virtue of this self-seclusion is relatively to that objective aspect neutral, leaving it quite untrammelled. Just as therefore, on the spiritual side of the content, the particularity of the personal life is not set forth in direct union with its substance and universality, but is essentially reflected as the culminating feature of its independent embodiment[230], so, too, in the objective envisagement of form, the particularity and universality of the same are carried from their previous plastic union[231] to a predominance of the individual aspect, and indeed of comparatively accidental and indifferent features, and in a manner much the same as that which, in the reality of sense experience, is the prevailing character of all phenomena.

(β) A *further* important point is that connected with the range of *scope* that is permitted to the art of painting in virtue of its principle with regard to the objects to be thus presented.

The free principle of subjectivity suffers on the one hand the entire field of natural objects, and every department of human activity to remain in its substantive mode of existence; on the other, it is capable of entering into fusion with all possible detail, and creating therefrom a content of its own ideal life, of rather we should say that only in this interfusion with concrete actuality does it assert itself as concrete and vital in its products. Consequently it is possible for the painter to import a wealth of material into the realm occupied by his artistic works, which remains outside, the reach of the sculptor. The entire world of the religious idea, conceptions of

heaven and hell, the history of Christ, his disciples and saints, external Nature, all that concerns humanity down to the most fugitive of situations and characters, all this material and more can find a place here. For as we have seen all that pertains to the detail, caprice, and accidental features of human need and interest is affected by this principle, which at once strives to comprehend and compose it.

(*γ*) And along with this fact we have as its *corollary* that painting makes the *soul* of man itself the subject of its creative work. All that is alive within the soul is present in ideal form, if it is, when we consider its content, at once objective and absolute in the abstract sense[232]. For the emotional life of soul can without question carry the universal within its content, a content, however, which, as feeling, does not retain the form of this universality, but appears under the mode as I, this individual person — I know my identity therein and feel the same. In order to educe and set forth this objective content as objective, I must forget myself. In this way the painter no doubt reveals to our sight the ideal substance of soul in the form of external objects, but the truly real content which it expresses is the personal soul that feels. For which reason painting, from the point of view of form, is unable to offer such distinctive envisagements of the Divine as sculpture, but only ideas of less defined character such as belong to the emotions. It may appear as a contradiction to this position that we find again and again selected as subjects of the paintings of masters, who stand without question in the highest rank, the external environment of mankind, mountains, valleys, meadows, brooks, trees, ships, buildings, their interiors, in short earth, sea, and sky. What, however, constitutes the core in the content of such works of art is not the objects themselves, but the *vitality* and soul imported into them by the artist's conception and execution, his emotional life in fact, which is reflected in his work, and gives us not merely a counterfeit of external objects, but therewith his own personality and

temperament[233]. And it is precisely by his doing this that the objects of Nature, as reflected by painting, even from this realistic point of view, are relatively insignificant, because the influence of soul-life begins to assert itself in them as the main significance. In this tendency towards temperament, which, in the case of objects borrowed from external Nature, may frequently only amount to a general response emphasized between the two sides, we find the most important distinction between painting on the one hand and sculpture and architecture on the other. Painting indeed approximates in this respect more closely to music and emphasizes here the point of transition from the plastic arts to that of tone.

(*b*) To proceed to our *second* main division I have already several times referred, if only in respect to features of fundamental importance, to the difference we discover between the sensuous *material* of painting and that of sculpture. I will therefore in this place only touch upon the closer connection which obtains between this material and the spiritual content which it most notably has to display to us.

(*α*) The first fact we have to consider in this connection is this that painting compresses the *three* dimensions, of Space. Absolute concentration would be carried to the point, as elimination of all juxtaposition, and as unrest essentially predicable of such concentration, as we find it in the point of Time. Such a mode of negation carried out in its entire result, however, we only meet with in the art of music. Painting, on the contrary, permits the spatial relation still to subsist, and only effaces *one* of the three dimensions; superficies is made the element of its representations. This reduction of the three dimensions to level surface is implied in principle of increasing reality, which is only capable thereby of asserting itself in spatial relation as such ideal transmutation, owing to the fact that it does not suffer the complete totality of objective fact to persist as such, but restricts the same. Ordinarily we are accustomed to view this reduction as a caprice of the art

which amounts to a defect. What is here sought for, it appears, is that natural objects in all their naked reality, or spiritual ideas and feelings, by means of the human body and its postures should be made visible to our senses for such an aim it is obvious that the surface is insufficient and inferior to Nature, which appears before us with a completeness wholly different.

(*αα*) Painting is unquestionably yet more abstract than sculpture in respect to material conditioned in Space; but this abstraction, remote as it is from being a purely capricious limitation, or an indication of human incapacity, is just that which brings about the necessary advance from sculpture. Even sculpture is not simply an imitation of natural or physical existence, but a creation of intelligence, which removes from form all aspects of natural existence which are not in accord with the definite content it undertakes to present. This elimination was carried out by sculpture in the case of all colour detail, so that what remained to it was only the abstraction of material form. In painting we have the opposite process, its content being the ideality of soul-life, which can only appear on the face of objective reality, by a process of self-absorption from that very material[234]. The art of painting, therefore, no doubt, works for the sense-perception, but in a way, through which the object which it displays remains no longer an actual natural existence wholly in Space, but is changed to a counterfeit creation of intelligence, in which it only so far reveals its spiritual source as it annuls the actual existence of its object, recreating it for itself in a purely phenomenal semblance within its own spiritual realm — for Spirit.

(*ββ*) And to this intent painting must necessarily effect a breach with the totality of the spatial condition, and there is no reason for charging to human incapacity this loss of Nature's completeness. In other words, inasmuch as the object of painting from the point of view of its spatial

existence, is merely a semblance, reflective of the soul of man, exhibited by art for his spirit, the self-subsistency of the object as we find it actually in Space is dissolved, and the object is related in a far more restricted way to the spectator than is the case in sculpture. A statue is by itself wholly an isolated object, independent of the spectator, who may place himself where he pleases; his point of view, his movements, his walking round it, not one of them affect the work of art as a whole[235]. If this self-subsistency is to be preserved the sculptured figure must also have some definite impression to offer each and every point of view. And this independence of the work must be retained in sculpture for the reason that its content is the tranquillity, self-seclusion, and objective presence which, in both an external and ideal sense, reposes on their own substance. In painting, on the contrary, whose content is conditioned by an ideal atmosphere, and in fact is composed of ideal relations essentially particularized, it is precisely this aspect of discord in a work of art between object and spectator which has to be emphasized, and yet with a like directness to be resolved in the fact, that the work, as depicting the ideality of intelligence in its entire mode of presentation, can be only defined under the assumption that it stands there related to an individual mind, that is a spectator, and apart from the same has no self-subsistency. The spectator is assumed and reckoned to be there from the first, and the work of art is only intelligible as related to this point of personal contemplation[236]. For such a relation to mere *visibility* and its reflection upon an individual consciousness, however, the mere show of reality is sufficient; or rather the actual totality of the spatial condition is a defect, because in that case the objects seen retain an independent existence, and do not appear to be created by Spirit for its own contemplation. Nature consequently is not entitled to reduce its images to the plain surface; its objects possess and claim to possess a real and independent existence. The satisfaction, however, we derive from painting is not in actual existence, but

in the contemplative interest we receive from the external reproduction of ideal truths, things born of the soul, and its art therefore dispenses wholly with the need and apparatus of spatial reality in its complete organization.

(*γγ*) And together with this reduction to the level surface we may *thirdly* associate the fact that painting is placed in a still more remote position to architecture than that occupied by sculpture. Works of sculpture even where exhibited independently for themselves in public places or gardens, require some kind of pedestal treated architectonically, and, in the case of apartments, forecourts, and halls, either the art of building merely assists in presenting the statue's fitting environment, or conversely the sculptured figure is used as the decoration of the building, and between these two thus related objects we find a close association. Painting, on the contrary, whether placed in the enclosed apartment, or in public halls, or under the open sky, is limited to the wall. Originally its function is simply to fill up empty wall spaces. Among the ancients this original destination is mainly sufficient, and they decorated in this way the walls of their temples, and in more recent times also their private chambers. Gothic architecture, whose main task is the enclosure under the most grandiose conditions, supplies no doubt still larger surfaces, or rather the largest possible, yet it is only in the most ancient mosaics that we find painting is employed as a decoration of empty spaces, whether in the case of the outside or the interior. The more recent architecture of the fourteenth century, on the contrary, fills up its enormous wall surfaces in an architectural manner, the most imposing example I know of which is the main *façade* of Strasbourg cathedral. Here we find that the empty surfaces, excluding the entrance doors, the rose and other windows, are filled in by the ornamental work analogous to that of windows traced over the walls, and decorated by figures of considerable delicacy and variety of form, so that we have no need here for painting. In the case of religious architecture, therefore, painting mainly appears in

buildings which begin to approximate to the ancient type of architecture. As a rule, however, Christian painting is to be distinguished from the arts of building, and presents its works in independent form, as for example in large pictures, whether placed in chapels or on high altars. It is true that here, too, the picture must retain some relation to the character of the place, which it is destined to fill; for the rest, however, it is not merely intended to fill up wall spaces, but to hang them as a work of art independently just as a work of sculpture may do. In conclusion painting has its use as a decoration of halls and apartments in public buildings, town halls, palaces, and private houses, in which respect its association with architecture is once more closely marked, an association, however, in which its independence as a free art ought not to be lost.

(*β*) A further necessary ground for the contraction of the spatial dimensions in painting to bare surface is due to the fact that the art of painting is concerned to express ideal conditions essentially in their separation[237], and thereby rich in every kind of particular character. A mere restriction to the shapes of *spatial* form, with which sculpture is able to rest satisfied, vanishes therefore in the more luxuriant art; for the forms of spatial dimension are the most abstract in Nature, and an attempt must now be made to seize particular distinctions, in so far as the demand is now for an essentially more multifold material. The matter specifically defined in the *physical* sense is attached to the very principle of presentation in Space, the differences of which[238], if they are to appear as essential in the work of art, themselves disclose this fact[239] in the total configuration of spatial form, which no longer remains the final mode of presentation, and they are compelled to make a breach in the complete form of spatial dimensions, in order to cancel the exclusive appearance of the physical medium. For the dimensions in painting are not presented by themselves in their actual

reality, but are merely by means of this physical aspect made to appear and be visible as such.

(*αα*) If we further inquire what is the nature of the *physical* element which the art of painting makes use of we shall find this to be *Light*, regarding it as that medium which renders all objects whatever visible.

Previously the sensuous, concrete material of architecture was the resisting matter of gravity, which more particularly in the art of building asserted this character of heavy material in its features of burden, constraint, power to support and be supported, and even in sculpture still retained such characteristics. Heavy material encumbers because it does not possess its centre of material unity in itself, but in something else; and it seeks for this centre and strives towards it, though it retains its position through the resistance of other bodies, which become by doing so bodies of support. The principle of light is an opposite, or extreme, of that material of weight which is not as yet enclosed within its unity. Whatever else we may predicate of light it is obvious that it is absolutely devoid of weight and offers no resistance; rather it is pure identity with itself, and thereby simple self-relation, the primordial ideality, the original self of Nature. In light Nature make its start on the path of ideality or inwardness[240], and is the universal physical ego, which of course is not carried here to the point of particularity[241], nor has as yet concentrated itself within the unit of individuality and self-seclusion, yet is thereby enabled to cancel the bare objectivity and external show of heavy matter and abstract from the sensuous and spatial totality of the same[242]. From this aspect of the more *ideal* quality of light it becomes the physical principle of the art of painting.

(*ββ*) Light regarded simply as such, however, only exists as *one* aspect contained in the principle of subjectivity, that is, as this more ideal identity. In this respect light is manifestation, just that, which, however, in Nature is only asserted *generally* as the power of making objects visible, holding the

particular content of that which it reveals outside itself as an objective world, which is not light, but rather that which confronts it and consequently is dark. These objects light renders cognizable under their distinctions of form by irradiating them, that is, illuminating to a greater or less degree their obscurity and invisibility, and permitting certain parts to be more visible, namely, as they approach the spectator, and others, on the contrary, more obscure as they withdraw from him. For light and darkness, putting for the present on one side the particular colour of an object, is generally speaking due to the relative remoteness of the illuminated objects from us in their specific degree of illumination. In this direct relation to objectivity light is no longer asserted simply as light, but as essentially particularized brightness and obscurity, light and shadow, whose varied manifestations render the shape and distance of objects from one another intelligible to the spectator. This is the principle which painting makes use of, because from the first differentiation is implied in its notion. If we compare this art in this respect with sculpture and architecture we shall see that in these latter arts the actual distinctions of spatial configuration are set forth in their nakedness, and light and shadow are suffered to retain the ordinary effect which light produces in Nature relatively to the position of the spectator, so that the rondure of form is here already independently[243] present and light and shade, whereby they are rendered visible, are merely a result of that which was already actually on the spot independently of this further aspect of their becoming visible. In the art of painting, however, brightness and darkness together with all their gradations and finest transitions are themselves part of the fundamental *artistic material*, and it is a purely *intentional appearance* they produce of that medium, which sculpture gives form to in its *native* state. Light and shade, in short, the appearance of objects under this illumination, is effected by art rather than the mere natural light, which consequently only makes that kind of

brightness, darkness, and lighting *visible*, which are the products of painting. And this it is which constitutes the positive rationale deduced from the material of the art itself, why painting does not require three dimensions. Form is the creation of light and shadow simply, and that form which exists in spatial reality is superfluous.

(*γγ*) Bright and dark, shadow and light, no less than their interplay are, however, merely an abstraction, which do not exist in Nature as such abstraction, and consequently cannot be utilized as sensuous material. In other words Light, as we have already seen, is related to its opposite Dark. In this relation both principles have no self-subsistency apart from each other, but can only be asserted in their unity, that is, as the interplay of light and dark. The light, which is in this way essentially impaired and obscured, which, however, to a like extent transpierces and illumines darkness[244], supplies us with the principle of *colour* as the genuine material of painting. Light in its purity is devoid of colour, it is the pure indeterminacy of essential identity. Distinction from bare light, a lowering of its value, is the characteristic of colour, which in contrast to light is already in some degree obscurity, and together with which the principle of light is asserted in union. It is consequently an incorrect and false idea to hold that light is the aggregate result of different colours, or in other words different degrees of obscuration[245].

Form, distance, limitation, rounded shape, in short, all spatial relations and distinctions visible in the phenomena of Space are unfolded in the art of painting entirely by means of colour, the more ideal principle of which is capable of presenting a more ideal content and by virtue of its profounder oppositions, the infinite variety of its transitional gradations and the delicacy of its softest modulations relatively to the fulness and detail of the objects it accepts as subject-matter, is possessed of a field for its activity of the widest range. It is beyond belief what mere colour is able to accomplish

in this art. Two human beings are, for example, something totally distinct. Either is in his self-conscious identity no less than his bodily organism an independent and exclusive spiritual and bodily totality, yet the entire result of this difference is in a picture reduced to a distinction of colours. In one place some particular shade of colour ceases, in another a particular one starts up, and by such means we get everything set before us, shape, distance, play of posture, expression, what is nearest to sense and what is most akin to intelligence. And we are not to regard this reduction as a make-shift and defect. Quite the reverse is the fact; the art of painting dispensing with the third dimension in no such way, but deliberately rejecting it in order to set in the place of purely spatial reality the higher and richer principle of colour.

(*γ*) This wealth enables painting to elaborate in its reproductions the entire extent of the phenomenal world. Sculpture is more or less restricted to the stable self-seclusion of individuality. In painting, however, the individual cannot remain in such limitations of stability whether regarded in his ideal aspect or relatively to the external world, but is placed in every kind of varied definition. For on the one hand, as already pointed out, he is placed in a far closer relation to the spectator, and on the other he receives a more varied connection with other individuals and the environment of Nature. A process, therefore, which merely illuminates semblance of objective fact makes possible the widest expansion of distances and spaces and the present of such and all the varied objects that appear in them in one and the same work of art. Yet it must no less, as a work of art, prove itself to be a self-contained and unified whole, and exhibit itself in this synthesis, not simply as an aggregate whose limits and boundaries are defined by no principle, but rather as a totality whose unified consistency is due to its own subject-matter.

(*c*) In the *third* place we have, after this general consideration of the content and sensuous material of painting, briefly to adduce in general terms the principle of the *artistic mode* of treatment adopted by it.

The art of painting more so than either sculpture or architecture admits of the two extremes. In the first case prominence is given to the religious and ethical severity of the conception and presentation of the ideal beauty of form, and in the second, where the subject-matter is, taken by itself, insignificant, to the detail of what it contains and the personal aspect of the creative art. We may therefore not unfrequently hear two extreme kinds of criticism. Our critic in the one case apostrophizes the nobility of the object, the depth and astonishing sufficiency of the conception, the greatness of the expression, and the boldness of the delineation[246]. And in the other equal praise is given to the fine and unexampled character of the painter's treatment of his colour. This contrast is implied in the very notion of the art; indeed, we may affirm that it is impossible to unite both aspects on one plane of elaboration. Each must remain inevitably independent of the other. For painting has shape simply as such, that is, the forms of spatial limitation, no less than colour as means contributive to its artistic result, and is placed thereby midway between the Ideal of the plastic arts and the extreme form of the direct detail of Nature's reality; by reason of which we get two distinct types of painting. One, that is the ideal, whose essential basis is universality; and the other, that which presents particular objects in all their closeness of detail.

(*α*) In this respect painting must accept, in the first instance, as sculpture, that which is substantive in the sense that the objects of religious belief are such, no less than the great events of history, and its pre-eminent individual characters, albeit it renders visible this substance in a form wherein the ideal and personal aspect is emphasized. It is the imposing character, the serious significance of the action portrayed, or the depth of the soul

expressed which is here of most importance, so that the elaboration and employment of all the rich artistic means which are within the reach of painting, and the dexterity, which the wholly consummate use of these means demands regarded as a *tour de force* of technique, cannot here be entirely indicated. In cases of this kind it is the force of the content to be presented and the absorption in what is essential and substantive in the same, which tend to drive into the background the overwhelming facility in the art of painting as that aspect which is less essential. In this sense, for instance, the Cartoons of Raphael are of invaluable merit, and fully display the entire excellence of their composition, although Raphael, even in the case of particular pictures, despite all his mastery in drawing, and the purity of his ideal, and at the same time wholly vital personal figures, and the composition he may have arrived at, most certainly in colour, and all that concerns landscape and other aspects, is excelled by the Dutch masters. This is yet more the case with the earlier Italian heroes of art, in contrast to whom Raphael is to a somewhat similar degree inferior in depth, power, and ideality of expression, as he surpasses such in the technique of his craft, in the beauty of vital grouping, in draughtsmanship and the like[247].

(*β*) Conversely, however, the art of painting, as we have seen, ought to advance further than this exclusive absorption in the ideal and infinite content of man's soul-life; its function is equally to assert the subsistency and freedom of detail, which however incidental it may be, contributes to the environment and background of the work. In this advance from the profoundest seriousness to the objective features of independent detail it is bound to force its way to the extreme articulation of the purely phenomenal, where any and every content is a matter of indifference, and artistic illusion in a realistic sense is the main interest. In such a type of art we find depicted for us the most fugitive aspect of the sky, the time of day, the lighting up of the woods, the gleam and reflection of the clouds, waves, lakes, streams, the

shimmer and glitter of wine in the glass, the glance of the eye, and every conceivable look and smile of the human countenance. Painting in such cases moves from the idealistic standpoint to that of living reality, whose phenomenal effect it mainly seeks to reproduce by means of accuracy in the execution of every bit of detail[248]. Yet this effort is no mere assiduity of elaboration, but a real exercise of genuine talent, which strives to present every kind of detail in its independent perfection, and yet retain the whole composition in unity and fusion, and this can only be done by the finest art. In such work the vital force of the realistic appearance thus secured tends to be more near to the artist's aim than the Ideal; and it is precisely this kind of art, as I have already found occasion to remark, which raises, as no other, controversial points over the significance of the Ideal and Nature. No doubt it is very possible to blame the use of the most elaborate technique in subjects of little importance by themselves as mere extravagance; yet there is no real reason for rejecting such material, and it is precisely of that kind which ought to be treated in this way by art, and be permitted to keep every conceivable subtlety and refinement of surface appearance that it possesses.

(*γ*) The artistic treatment does not, however, stop at this more general kind of opposition, but, inasmuch as painting reposes on the principle of soul-expression and particularity, proceeds yet further in the direction of differentiation in its results. Both architecture and sculpture, it is true, assert differences of national type, and in particular we are made aware in sculpture of a closer individuality typical of certain schools and masters. In the art of painting this distinction and personal aspect in the modes of representation expands to an incalculable degree in proportion as the objects, which it may accept, are taken from a field without definable limitations. In this art to a pre-eminent extent the genius of particular peoples, provinces, epochs and individuals asserts its claims and affects not merely the choice of subjects and the spirit of their conception, but also the

character of drawing, grouping, colouring, handling of the dry point no less than that of particular colours down to characteristics of personal style and wont.

Inasmuch as the function of painting is so without restriction concerned with the ideal aspect and the details of its subject-matter, it follows of course that it gives us quite as little opportunity to make definite statements of universal validity as to adduce specific facts which can always without exception be accepted as true of it. We must, however, not rest satisfied with what I have already discussed in respect of the principle of the content, the material and the artistic treatment, but make a further effort, however much we leave on one side all that confronts us in its multifold variety, still to subject certain aspects, that most emphatically enlist our attention, to further examination.

2. PARTICULAR MODES OF THE DEFINITION OF PAINTING

The different points of view, according to which we have to undertake this closer characterization, may be already anticipated from our previous discussion. They refer once more to the content, the material and the artistic treatment.

First, as to *content*, we have no doubt found the content of the romantic type of art offer the most adequate subject-matter; we must, however, inquire further what specific portions we should select from the entire wealth within this type as pre-eminently adapted to the art of painting.

Secondly, we have already made ourselves fairly cognisant with the *principle* of the sensuous material. We have now to define more narrowly the forms, which may be expressed on the level surface by means of colouring, in so far as the human form and other facts of Nature have to be made visible in order that the ideality of Spirit may be thereby disclosed.

Thirdly, we have a similar question with regard to the definite character of the artistic conception and presentation, which corresponds to the different character of the content thus itself similarly differentiated, producing thereby different *types* or schools of painting.

(*a*) I have already at an earlier stage recalled the fact that the ancients have had excellent painters, but added thereto the statement that the function of painting is only completely satisfied by the way of looking at things and the type of art which is referable to the emotional life and which is actively asserted in the romantic type of art. What appears, however, to contradict this from the point of view of content is the fact that at the very culminating point of Christian painting, during the age of Raphael, Rubens, Correggio, and others, we find that mythological subjects are used and portrayed in part on their own merits, and in part for the decoration and allegorization of great exploits, triumphs, royal weddings, and so forth. In this sense Goethe, for example, has once more borrowed from the descriptions of Philostratus of the pictures of Polygnotus, and, assisted by his imaginative powers as a poet, has added a novel freshness to such subjects for the painter's benefit. If, however, such contributions further imply the demand that subjects of Greek mythology and saga, or scenes, too, from the Roman world, for which the French at a certain period of their painting have evinced a great inclination, should be conceived and portrayed in the definitive mood and significance attached to them by the ancient world we can only object generally that it is impossible to recall to life this past history, and what is peculiarly appropriate to the antique is not wholly compatible with the art of painting. The painter must consequently create from such material an entirely different result, must import therein a totally different spirit, other emotions and modes of seeing things than those present to the ancients, in order to bring such a content into accord with the real problems and aims of painting. For this reason also the circle of antique

material and situations is not that which painting has elaborated in a consequential process; rather it is an aspect of it which has been passed over as alien to its material, and which has first to be essentially remodelled. I have several times insisted that painting has before all to seize that, the presentment of which it can, in deliberate contrast to sculpture, music, and poetry, master by means of external form. And this is pre-eminently the self-concentration of Spirit, which is denied to sculpture, while music again is unable to make the passage to the external appearance of ideality, and poetry itself can merely render visible the bodily presence in an incomplete way. Painting, on the contrary, is still in a position to unite both aspects. It can express the entire content of soul-life in an external form, and is consequently bound to accept for its essential content the emotional depth of the soul no less than the particular type of character and its specific traits in its deepest impression — in other words intensity of feeling and ideality in its differentiation, for the expression of which definite events, conditions, and situations not only must appear as the explanatory source of individual character, but the specific individuality must disclose itself as a part of the moulded form of the soul and physiognomy, rooted therein, and entirely taken up into the external embodiment.

In order to express generally this ideality of soul we do not require that ideal self-subsistency and largeness[249] of the classical type we have previously dealt with, in which individuality persists in immediate accord with the substantive core of its spiritual essence and the physical characteristics of its bodily presentment; to quite as little extent will suffice to the manifestation of this soul-life Nature's ordinary hilarity, that Greek geniality of enjoyment and blissful absorption in its object; rather true depth and self-revelation of spiritual life presupposes that the soul has worked its way through its emotions, its forces, its whole inward life, has overcome much, has suffered and endured much anguish or misery of spirit, and yet in

all these divisions has retained its sense of unity and come back to the same out of them. The ancients no doubt also place before us in the mythos of Hercules a hero, who after many troubles receives his apotheosis, and enjoys among the gods the repose of blessedness; but the labours which Hercules accomplishes are purely external, and the bliss, which he obtains as a reward, is merely a tranquil cessation from labour; and the ancient rune, that Zeus will have brought his empire to its consummation by his efforts, he, that is the greatest hero of Greece, has not accomplished. Rather the end of the rule of these self-subsistent gods then commences for the first time, where we find man overcomes the dragons and serpents of his own breast, the obstinacy and stubbornness of the soul's native realm rather than the living dragons and serpents of Nature. Only thereby will Nature's gladsomeness attain to that loftier cheerfulness of the spirit, which is perfected in its passage through the negative phase of division, and finally secures an infinite satisfaction through such travail. The feeling of blitheness and happiness must be glorified and expanded in real blessedness. For happiness and content still retain an association with external conditions which partake of Nature's contingency. In blessedness, however, that happiness, which is still related to immediate existence, is left behind, and the entire content is made one with the inner life of soul. Blessedness is a satisfaction which is an attained result, and is thereby justified; it is the gladness of a victory, the emotion of a soul which has essentially set at nought what is sensuous and finite, and thereby thrust from itself the care which lurks for ever in ambush. Blessed is the soul, which has, it is true, experienced both conflict and pain, but come victorious through its troubles.

(α) If we now inquire what is the nature of the actual *Ideal* in this content we shall find it to be the *reconciliation* of the individual soul with God, who in His human manifestation has Himself traversed this passage of sorrows.

The substantive ideality[250] can only be that of *religion*, the peace of self-consciousness, which only feels itself truly satisfied, in so far as it is concentrated in its own substance, has broken its earthly heart, has raised itself above the purely natural conditions of finite existence, and in this exaltation has secured an inward life of universal significance, an ideal union in and with God Himself. The soul wills itself, but it finds the object of its will in something other than itself, in its particularity; it thereby gives itself up in its opposition to God, in order to find itself again and its joy in Him. This is the vital character of Love, the soul's function in its truth, that is religious love purged of mere desire, which communicates to Spirit reconciliation, peace, and blessedness. It is not the enjoyment and delight of the actual love of living nature, but rather one that is devoid of passion, nay, one that is without inclination, a tendency of the soul, a love in fact which on the side of Nature is identical with death, and is such a state, so that the actual relation as earthly bond and relation of man to man floats before us as a thing of the Past, which essentially has no consummation in its usual existing form, but carries within itself the defect of its temporality, and as such prepares the way for an exaltation to something beyond it, which is found to be at the same time a conscious state and enjoyment of a love that is without yearning and sensuous desire.

It is this character which gives to us the soulful, intimate, and more elevated Ideal, which we find now in the place of the tranquil greatness and self-subsistency of the antique. No doubt the divinities of the classical Ideal were not without a trait of sombre grief, a negative replete with fateful import, which is as it were the shadow of a cold Necessity passing over these blithesome figures, which remain, however, secure in their substantive divinity and freedom, their simple greatness and might. The freedom of Love, however, is not a freedom of this kind, being more instinct with soul-life, for the reason that it subsists in a relation between soul and soul, and

spirit to spirit. This inward glow enkindles the ray of bliss made actual in the soul, a love, which in suffering, and the extremest loss not merely can discover comfort or independence therefrom, but in proportion to the depth of its suffering can feel the more profoundly therein the reality and assuredness of its love, making clear the mastery of its own essential substance in that suffering. In the Ideal of the ancients on the contrary we find no doubt, independently of that trait of a tranquil sorrow already indicated, the expression of the pain of noble natures, as for instance in the case of Niobe and Laocoon. They do not betake themselves to lamentation and despair, but adhere to their greatness and loftiness of spirit; but this self-continency remains empty; their suffering, their pain is likewise the conclusion of the matter. In the place of reconcilement and satisfaction we can only have an austere resignation, which, without suffering entire collapse, surrenders that upon which it had previously laid hold. It is not the base that is crushed[251]; no rage, no contempt or vexation is expressed; but despite of it all the loftiness of this type of individuality is nought but an inflexible self-continency[252], an endurance of destiny that is without relief, in which the nobility and pain of the soul do not appear as reconciled in fulfilment. In the romantic love of religion we find for the first time the expression of blessedness and freedom. This union and satisfaction is by nature concrete in a spiritual sense, for it is the feeling of Spirit which is made cognizant of its unity in something other than itself. And for this reason we find necessary here, if the content presented is to be complete, two aspects, in so far as the reduplication of spiritual personality is necessary to love's appearance. It reposes upon two independent individuals who possess, however, the sense of their intrinsic union. With this union, however, the negative condition is always at the same time connected. In other words Love belongs to the soul's condition; the subject of such a conscious state is, however, this independently self-stable[253] heart, which to

experience love must bid good-bye to itself, surrender itself and sacrifice the unyielding focus of its individual isolation. It is this sacrifice which constitutes the *motive* principle of Love, the life and emotion of which is bound up wholly in a self-surrender. In consequence of this, if notwithstanding a man retains his consciousness of self in an act of such surrender, and just in this very annihilation of his personal independence attains to a truly positive self-subsistency, in that case he has left him at least in the feeling of this unity and its supreme happiness the negative aspect, the movement of Love's principle, not so much in a sense of sacrifice, as of a blessedness undeserved, which in despite of himself permits him still to feel his assured identity at unity with itself. The movement is the feeling of the dialectical contradiction, namely, to have surrendered personality and yet to remain in self-subsistent unity, a contradiction which is present in Love and eternally resolved in it.

In so far, then, as the aspect of an individual *human* state of soul-life is concerned in this universal condition we find that the unique Love, which blesses and discovers its heaven within it, tends to rise over all that is finite and the specific individuality of character, which lapses into a position of insignificance. Already we have observed that the divine ideals of sculpture pass into one another, always provided, however, that they are not wrested from the content and province of that original and immediate type of individuality; and yet it must be admitted that this individuality remains the essential form of the mode of presentment. In this later pure gleam of blessedness, however, particularity is on the contrary cancelled. Before God all men are equal, or rather piety makes them actually equal, so that the sole point of importance is the expression of love in the concentrated focus above depicted, and which has no further need of happiness, or this or that particular object. No doubt religious Love, too, requires definite individuals as a condition of its existence, which possess also, apart from this

experience, other spheres of existence; for the reason, however, that this soul-possessed state of intimate life supplies the really ideal content, the expression and reality of such are not to be found in the isolated distinctions of character, its talents, conditions, and fortunes, but are rather lifted above the same. When consequently nowadays we hear people make a regard for distinctions in the soul-life of different persons a matter of first importance in education, and in that which is the essential requirement of each man individually, from which we deduce the fundamental thesis that every one will and indeed inevitably must act differently in a given case, such a position directly clashes with the fact of the love of religion, in which all such diversities of individual life fall into the background. Conversely, however, individual characterization now, precisely for the reason that it is the unessential, which refuses wholly to fuse with the spiritual realm of celestial Love, receives a more emphatic definition. In other words, agreeably to the romantic type of art, it is free, and is written in character all the more distinct in proportion as it refuses to accept as its supreme principle classical beauty, that is the entire transfusion of immediate vitality, and the particularity of finite existence, with a spiritual or religious content. In despite of this fact, however, there is no absolute reason that this individual characterization should impair this inward intensity of Love, which, as such on its own account, is not shackled to such features, but has become free, and constitutes independently the truly self-substantive Ideal of Spirit.

What, then, constitutes the ideal centre and main content of the religious field is, as we have already indicated in our examination of the romantic type of art, the essentially *reconciled* and satisfied Love, whose object should appear in the art of painting, whose function it is to exhibit the most spiritual content under the mode of human and corporeal actuality, as no mere "beyond" of Spirit, but in its veritable presence. In conformity with

such a result we may adduce the Holy Family, and above all the love of the Madonna to her child as the ideal content pre-eminently fitted to this sphere. On either side of this centre, however, a mass of additional material extends which is in varying degree less adapted in this sense to the art in question. I will now attempt to differentiate the whole of this material on the following lines.

(*αα*) The first objectification is the object of Love itself in its pure universality and unimpaired unity with itself — God Himself in His unphenomenal essence — or God the Father. In this case, however, painting has great difficulties to overcome, when it attempts to depict God the Father as the religious imagination of Christendom seeks to grasp Him. The Father of gods and men regarded as a particular personality is exhaustively dealt with by art in Zeus. What on the contrary falls away from the Christian conception of God the Father is the human individuality, in which painting is alone in a position to reproduce the spiritual aspect. For taken in His independent self-exclusion God the Father is no doubt spiritual personality and supreme Power, Wisdom and so forth, but only retained as such without defined form and as an abstraction of thought. The art of painting is, however, unable to avoid anthropomorphization, and must perforce assign to Him the figure of man. However broad in its generalization, however lofty, ideal, and masterful the presentment of such a figure may be, we fail to get beyond the fact that it is entirely a human individual of more or less grave aspect, which fails entirely to coalesce with the conception of God the Father. Among the early Flemish painters Van Eyck in his God the Father of the altar picture at Ghent has attained the greatest success that we can conceive as possible in this sphere. It is a creation that may well match our conception of the Olympian Zeus. But however consummate it may be also in its expression of eternal repose, loftiness, power, worth, and other qualities — and it is quite impossible to overstate the depth and imposing

character of its conception no less than its execution — yet our imagination cannot fail to find something in it which does not satisfy. For what is here set before us as God the Father, that is to say a creation that is likewise human personality, is just what we first meet with in Christ the Son. It is in Him that we contemplate for the first time this decisive moment in which individuality and human existence combine as a moment in the Divine Life[254], and moreover combine in such a way that the same is not disclosed as an ingenious creature of the phantasy, as was the case with the Greek divinities, but as essential and very revelation, the fact of all importance and fundamental significance.

(*ββ*) The more essential object, therefore, of Love in the creation of painting will be *Christ.* In other words, with this object Art at once finds itself in the sphere of humanity, a sphere which along with Christ embraces further material in its presentations of the Virgin Mary, Joseph, John the Baptist, the disciples, and so forth, and ultimately the common folk who in part are followers of the Gospel, and in part cry out for the crucifixion of its Master and mock Him in His sufferings.

And here once more the already mentioned difficulty confronts us how we are to conceive and depict Christ in his *universality*, when he is presented in the ordinary way of half-length figures or portraits. I must admit that for myself at any rate, the heads of Christ I have seen by Caracci and others and, to take two famous examples, that of Van Eyck, formerly in the Sully Collection and now in the Berlin Museum, and that of Von Hemling, now in Munich, do not give me the entire satisfaction which they ought to do. That of Van Eyck, no doubt, is very imposing in figure, forehead, colour, and general conception, but the mouth and eye wholly fail to express anything that transcends our humanity. The expression is rather that of an inflexible seriousness, which is emphasized by the general type of the form, the parting of the hair, and other traits. And when such heads

incline still further in expression and shape towards the specifically human type, and a milder, more yielding and tender aspect is thereby imported, much of their depth and power of impression is very readily lost; and least of all suited to such, as I have already observed, is the beauty of Greek form.

For this reason Christ, as depicted in the experiences of His actual life, is a more suitable subject for pictorial effort. Yet in this connection an essential distinction must not be overlooked. It is quite true that in the biographies of Christ we have from one point of view the human consciousness of God presented us as a fundamental aspect. Christ is one of the gods, but under the guise of an actual man, and takes His place among men as one of them, in whose phenomenal appearance He can consequently be depicted in so far as such expresses the life of Spirit. From another point of view, however, he is not merely an individual man, but entirely God. In such situations, therefore, in which this supreme Divinity forces its way beyond the limits of human soul-life, the art of painting is met with a fresh source of difficulty. The very depth of the content begins to be too overpowering. For in the majority of cases in which we find Christ presented for example merely as a teacher, art will not pass much beyond the point in which He is depicted as the noblest, most worthy, and wisest of men, much as Pythagoras or any other wise man, is presented to us in such a picture as Raphael's "School of Athens." The most important way in which painting can overcome such a difficulty is to bring the Divinity of Christ mainly into direct contrast with His surroundings, and above all, to contrast it with the sins, the repentance and penance, or the meanness and evil of our humanity, or again conversely through His worshippers, who, by their adoration of Him remove Him as one of themselves and a man, existing in a particular place, from such immediate conditions, so that we behold Him exalted to the heaven of Spirit, and at the same time get a

glimpse of the fact that His appearance has not merely been that of God, but also that of the human form under its ordinary and natural, in other words, not wholly ideal conditions, who as Spirit essentially possesses his existence in our humanity and the human community, and expresses His divinity as reflected in the same. But we must not understand this reflection as though God is present in humanity as in a purely accidental or external mode of form and expression; rather we ought to regard the Spirit manifested in the consciousness of mankind as the essential spiritual existence of God Himself[255]. Such a mode of presentation will be exceptionally appropriate where Christ is to be represented as man, teacher, as the risen and glorified person who ascends up to heaven before our eyes. To speak plainly, in situations such as these the means of expression in painting such as the human form and its colour, the countenance, the glance of eye, are not wholly sufficient to express all that is implied in the Christ. And least of all will the antique beauty of forms suffice. In particular the resurrection and ascension, and generally, all scenes in the life of Christ, in which He, the individual man, is already divested of immediate existence as such on His return to His Father, require a more elevated expression of Divinity than the art of painting is able to supply, for the reason that it ought to cancel the very means it uses in its representation, that is, the expression of human soul-life in its external form, and glorify the same in a light of purer quality.

Consequently, we shall find those scenes of Christ's life treated with greater advantage and more fitting effect in which He Himself has not yet arrived at the full consummation, or where His Divinity appears to be obstructed and depressed in the moment of negation. And this we find is the case in His *childhood* and the *Passion.* That Christ as a child expresses definitely from a certain point of view the significance which attaches to Him in religion. He is God Who becomes man, and Who consequently

passes through the stages of man's natural life. In another aspect of the same fact that He is presented to our minds as a child we are led to feel the practical impossibility of disclosing entirely to us all that He essentially is. And it is just here that the art of painting possesses the incalculable advantage of being able to show how the loftiness and dignity of Spirit can shine forth from the *naïveté* and innocence of the child, which in some measure derives actual force from such a contrast, and in part, for the very reason that it is predicated of an infant, is to an infinitely less extent required by us in comparison with that we look for in Christ as man, teacher, and judge of the world. In this way the examples of Christ the babe which we find in Raphael's pictures, and above all, that in the Sistine Madonna picture at Dresden, offer us the most beautiful presentment of childhood. We are, however, aware in them also of a tendency to pass beyond merely childlike innocence, a passage which discloses quite as much the Divine already present in the opening sheath, as it enables us to surmise the expansion of such Divinity to an infinite fulness of revelation, a revelation the incompleteness of which in the child carries with it its own justification. In the Madonna pictures of Van Eyck, on the contrary, the Divine babe is the least successful feature, for they are in general stiff and emphasize the defective form of a newly-born child. It has been attempted to regard this as allegorical and intentional. They are not to be fair in aspect because it is not the beauty of the Christ babe which is that which is adorable, but the Christ as Christ. Such a mode of thought is not consonant with the true aim of Art, and the babes of Raphael regarded as works of art are in this respect of far higher rank.

In the same way the history of *Christ's passion*, such as the scenes where He is mocked and crowned with thorns, that of the Ecce Homo carrying the cross, deposition, and burial, are exceptionally appropriate to pictorial presentment. For in these it is precisely the Divinity, in its contrast to its

triumph and in the depression of its unlimited power and wisdom, which supplies the content. Art is not merely able to present this, but there is ample room for the play of originality in the composition of such scenes without falling into purely fantastical imagery. God is here set before us as suffering, in so far as He is man and under certain determinate bounds. Such pain is not merely disclosed as human pain over human calamity, but it is an awful suffering, the feeling of an infinite negativity, albeit in human form, as the conscious life of one individual. And withal there is added, for the reason that it is God who suffers, a certain sense of alleviation, a reduction of such anguish which is thus unable to break forth in actual despair, distortion, and horror. This expression of *soul-suffering* is, more particularly in the works of several Italian masters, an original creation. The pain is in the lower portions of the countenance, a gravity of mien, and nothing more, not as in the Laocoon a contraction of the muscles, which can be interpreted as an actual cry; but in the eyes and on the forehead the billows of soul-anguish are, so to speak, allowed to roll over one another. The sweat drops that bespeak the heart's agony stand forth; and with true instinct on the brow, in which the immovable bone constitutes the determining feature, precisely at the point where nose, eyes, and forehead coalesce, and the life of mind and heart is concentrated and emphasized, we find that just one or two indications of skin-folds and muscles, unable to be distorted to any great extent, are suffered pre-eminently to bear and express in tension this accumulated weight of agony. In particular I can recall a certain head in the gallery of Schleisheim, in which the master — I fancy Guido Reni[256] — and doubtless others in a similar way, have discovered a distinct colour tone for the flesh, which is quite unlike that of human flesh. They had to disclose the night of the Spirit and created for the same a dowry of colour, most admirably adapted to express this tempest, these black clouds of Spirit

which are likewise encompassed by the brazen forehead of the Divine Nature[257].

As the most perfect subject of such painting, however, I have already affirmed that Love, which is essentially *satisfied*, whose object is no purely spiritual Beyond, but one actually present, so that we can behold Love itself in its object. The highest and most unique form of such a Love is that of the Virgin Mother for her Christ child, the love of the one mother who has brought forth the Saviour of the world and carries Him in her arms. This is the content of most loveliness to which we may say Christian art generally and pre-eminently the painter's art in the religious sphere has been exalted.

The love of God, and more expressly[258] that of which Christ is the object, is of an entirely spiritual type. Its object is only visible to the eyes of the soul, so that in these cases we do not in the strict sense get the reciprocity which is bound with the notion of Love, and moreover there is no natural tie which secures the lovers and from its origin binds them to each other. Every other type of love, to put the matter conversely, remains in some measure accidental in its incidence, and in another aspect of it the lovers possess, as, for instance, sisters, or the father's love for his children, yet further relations outside this particular one, which assert an essential claim upon them. A father or brothers are compelled to direct their attention to the world, the State, affairs or war, in one word universal ends; the sister becomes wife, mother, and so forth. In the case of a mother's love of her child, on the contrary, the love is from its very nature neither something that is contingent, nor is it merely a single phase[259]. It is its highest earthly type, in which its natural character and its most sacred function immediately coalesce. From the point of view, however, in which as a rule in maternal love the mother sees and feels at the same time her husband in her child, we may observe that this aspect, too, in the Virgin Mary's case disappears. Her feeling has nothing in common with a wife's love for her wedded husband;

on the contrary her relation to Joseph is rather that of a sister, and on the side of Joseph a feeling of respectful reverence for the Child that is God's and Mary's. We therefore find that religious love is set forth in its fullest and most ideal[260] human form, not in that for Christ amid His sufferings, nor in His resurrection, nor as He delays His departure among His friends, but in the emotional nature of a woman, in Mary. Her entire soul and life is human love for the Child, which she calls her own, and along with it adoration, and love of God with whom she feels herself thus united[261]. She is humble before God, and yet is steeped in the infinite exaltation that she is the single one among maidens who is above all blessed. Not alone and apart, but only in her Child is she made perfect in God, but in that, whether it be by the cradle or as queen of heaven, she is entirely content and blessed, without passion and yearning, with no other want, with no other aim to have or possess anything but that which she possesses.

The manifestation of this love under the aspect of its religious content expands in many directions, such as the annunciation, the visitation, the birth, the flight into Egypt, and other such incidents. We may also associate with it, during the later course of the Christ-life, the disciples and women, who follow Him, and in whom the love of God is more or less a personal relation of their love to the living, present Saviour, Who, as actual man, pursues His course among them, and in like manner also the love of those angels who, on the occasion of His birth and at other times, hover around in grave adoration or simple joy. In treating all such figures the art of painting in particular discloses the complete peace and content of such a love.

But this peace, furthermore, is dissolved in the most heartfelt anguish. Mary the mother beholds Christ carrying the cross. She sees Him suffer on the cross and die; she sees Him taken from the cross and buried, and no grief is more poignant than her own. And yet we may observe that it is neither the irreparableness[262] of such a grief, or rather of such a loss, nor the

weight of the calamity, nor the lament over the injustice of destiny, which constitutes the real content in such anguish, so that a contrast between it and the sorrow of Niobe is particularly instructive. Niobe, too, has lost all her children, and is set before us in severe loftiness and unperturbed beauty. The main content here is the aspect of the natural life of this ill-starred sufferer, the beauty in which Nature has robed her and which embraces the entire presentment of her actual existence. She, this actual personality, is beauty personified, and therein she persists. But her soul-life, her heart, has lost the entire content of its love, its soul, and her individuality and beauty can only turn into stone. The grief of Mary is of a wholly different type. She feels intimately the dagger which cuts through her soul's very centre, her heart breaks, but she does not become stone. She did not merely possess love, but her soul-life throughout is nothing but love, that is, free and concrete ideality, which retains the absolute content of that which it loses, and in the loss itself of the beloved persists in the peace of love. Her heart indeed breaks, but the substantive principle of her heart, the content of its life[263], which is disclosed through her anguish of soul with a vital strength that can never be lost, is something infinitely more exalted, namely, the living beauty of the human soul, as contrasted with its abstract substance, whose ideal existence as presented in *bodily shape*, when it is lost remains indeed indestructible, but is turned to stone.

There is one further subject for painting in connection with Mary the mother of Jesus, and that is her death and assumption. Schoreel has with exceptional beauty depicted a death of Mary in which we find the charm of her youth once more restored[264]. This master has united in his picture the expression of somnambulism, presence of death, rigidity, and blindness towards the exterior world with one which seems to suggest that the spirit, which seems somehow to penetrate through their general aspect, has found a home elsewhere and is blessed therein.

(*γγ*)*Thirdly*, we must include within the sphere of the actual presence of God in the life, sufferings, and glorification of Himself, *mankind at large*[265], that is to say the consciousness of *individual human life*, which God, or more accurately the events of His history, constitutes as itself an object of His love, communicating to it a content which is not merely finite but absolute in its significance. Here, too, we may emphasize the three aspects of tranquil *devotion*, *repentance*, and *conversion*, which both from the point of view of the soul and that of external condition the history of the Divine Passion repeats to mankind, no less than the ideal *consummation* in glory and the blessedness of pure attainment.

In respect to the *first* of these, namely, devotion, we have here what is primarily the content of *prayer*. This relation is in one aspect of it a humbling, surrender of the self, the seeking of peace in another; from another point of view it is not a *petition* but rather a *prayer*[266]. Petition and prayer are no doubt closely connected in so far, that is, as a prayer can be a petition. And yet the genuine petition seeks after something *for itself*. It importunes the man who possesses something of importance to myself, that he may feel inclined to do me a favour in virtue of the request, that his heart may yield, or his love may be roused toward me, in one word that his feeling of identity with myself may be awakened. What I, however, feel in making a petition is the desire for something, which the other person must lose if I am to secure it. The other person is to love me in order that my self-love may be satisfied, and my weal and necessity be promoted. I on the contrary give nothing further in the transaction unless it be contained in an admission that the person thus opportuned may ask for similar favours from myself. Prayer is not a petition of this type. It is an exaltation of the heart to the Absolute, which is assumed to be essentially Love, and as such possesses nothing independently[267]. The devotion itself is the gift, the petition itself is the blessedness. For although prayer may contain a petition

for some particular thing, yet it is not this particular thing which is the true purport of the prayer; rather the essential truth of it is the conviction that the petition will be heard, and not heard in its relation to the particular request so much as to the absolute trust that God will apportion that which is best for me to receive. And thus even in such a connection prayer is itself its own satisfaction, the enjoyment, the express feeling and consciousness of eternal Love, which not only with its ray of illumination shines through the object[268] of prayer and its situation, but in fact constitutes the situation and what is there actually or is thereby manifested. It is this type of supplication which we find exemplified by Pope Sixtus in the picture of Raphael already mentioned[269], no less than by Santa Barbara in the same picture, and by many other representations of the prayers of apostles and saints, of Saint Francis[270] and the like at the foot of the Cross, where we find in the place of the suffering of Christ, or the dismay, doubt, and despair of the disciples the love and adoration of God, and the prayer that loses itself in Him is selected as the significant content. We find such rendered with particular force for the most part on the countenances of aged men marked strongly with the sufferings and experience of life in the earlier period of painting, faces that appear to be portraits, souls permeated with devotional feeling to such an extent that this attitude of prayer does not merely appear to be experienced at this particular moment, but rather they are presented us as pious and saintlike persons whose entire life, thought, instinct, and volition is one prayer, and whose expression despite of all the truth of their portraiture may be summed up wholly in this assurance and peace of Love. It is otherwise, however, among many of the earlier German and Flemish masters. The subject of the altar picture in Cologne Cathedral is the adoring kings and patrons of Cologne. We find this subject too frequently selected by the school of Van Eyck. In such examples the persons who adore are frequently famous individuals, princes, as, for instance, in a well-known adoration

picture, which has been taken for the work of Van Eyck, critics have identified two of the kings with portraits of Philip of Burgundy and Charles the Bold. In the case of personages of this type we see that they are something more than saints, have affairs in the world, and only go to mass on Sunday or in the early morning, but during the rest of the week or for the rest of the day have other business to look after. And more particularly in our Flemish or German pictures the patrons are pious knights, God-fearing housewives with their sons and daughters. They resemble Martha who fares hither and thither and is concerned with matters of external or mundane significance, rather than Mary who has selected once and for all the best part. Their piety is not deficient, it is true, in intensity and soul; but we do not find here the song of Love which is at once the beginning and end of it, and which is perforce not merely an exaltation, a prayer, or thanks for a gift received, but is as much its unique life as that of the nightingale.

We may summarize the distinction which can be drawn generally in pictures of this kind between saints and worshippers on the one hand, and pious members of the Christian community as they actually appeared on the other, in the statement that the worshippers, more especially in Italian pictures, disclose in the expression of their piety a complete harmony of external and spiritual condition. It is their very soul which we find written for the most part on their countenances, which are not permitted to express anything opposed to the emotions of their heart. In the actual conditions of life this is not always the case. An infant, for example, when it weeps, more particularly when beginning to do so, quite apart from the fact that we know its grief is not worth the trouble of crying over, often makes us smile with its ugly faces. And in the same way old folk pucker up their face when they laugh, because the lines of their features are too pronounced, cold, and stiff to accommodate themselves readily to an unreserved and natural laugh or a friendly smile. The art of painting should endeavour to avoid this

incompatibility between the emotions of piety expressed and the sensuous forms which have to express them, and, so far as possible, produce a harmony between the soul and its external mode of expression. And this in the highest degree was effected by the Italians; the Germans and Flemish were less successful, because the main object in their work was living portraiture.

I will add one further remark, that this devotion of the soul ought not to reach the point of the actual cry of anxiety, that cry of tribulation and desire, such as the Psalms and many Lutheran hymns express, and we may illustrate it with the old words: “As the hart crieth for the water-brooks, so crieth my soul for Thee.” We may rather indicate it as a gradual melting away, not to that attenuation of sweetness perhaps we associate with the nun, but at any rate a surrender of the soul, and an enjoyment and satisfaction in such surrender. For that travail of faith, that anxious troubling of soul, that doubt and desperation which persists in disunion, such a type of hypochondriacal piety which never is certain whether it is still sin, whether there has been repentance and pardon is complete, a surrender, in which the soul can never advance a step, and is always betraying the fact by his anxiety, such a state is not compatible with the beauty of the romantic Ideal. We much prefer that the eye of devotion should raise its look of yearning heavenwards, although it is both more artistic and gives us yet more satisfaction when it is centred on some present object of adoration, whether it be the Virgin Mother, Christ, or saint. It is a facile thing, only too facile, to attach to a picture a spiritual interest, by making its central figure gaze heavenwards, anywhere beyond the world, just as we find that nowadays people are only too ready to make use of an equally facile way of proving God and religion to be the foundation of society by quoting texts of the Bible rather than establishing such a basis on the reason of actual reality. Such a gaze of countenance upwards becomes in the pictures of Guido

Reni[271], for example, a pure mannerism. The Assumption of the Virgin, too, which we find at Munich, has been much eulogized by its admirers and critics, and we may admit that the exalted character of its transfiguration, the absorption and surrender of the soul in the heavenly vision, and indeed the entire pose of the ascending figure, to say nothing of the brilliance and beauty of the colouring, is most impressive. But for myself I find such representations which depict the Virgin Mother in her own daydream of love and blessedness with her glance centred on her babe still more appropriate to her truth. The other type of yearning and strain, with its upward gaze heavenwards, is somewhat too near to our modern sentimentalism.

A *further* aspect of importance is concerned with the entrance of the principle of negation into the spiritual devotion of Love. The disciples, saints, and martyrs, have to pass through, in some measure as an experience of their souls, and in part, too, as one of their external life, that way of suffering along which the Christ in the history of His Passion passed before them.

This suffering lies to some extent on the confines of art. Painting can very easily overstep this boundary, in so far, that is, as it accepts for its subject-matter the horrors and terrors of the *bodily* torture, whether it be in flaying, or burning, or crucifixion, and its pains. This it is not permitted to do, if it is not to forsake the spiritual Ideal. This is not solely due to the fact that to present martyrs under such conditions to our sight is not beautiful to the sense, nor because our nerves nowadays are too keenly strung, but on the better ground that this material aspect is not the really important one. The true content we have to follow with sympathy and which should be depicted is the *spiritual* experience, the soul in all that it suffers through Love, and not the direct bodily pain of a certain individual, the grief for the sufferings of another, or the anguish felt personally for personal demerit.

The endurance of martyrs in physical tortures is an endurance which carries with it merely physical pain: what the spiritual Ideal looks for is the trial of the soul in its own domain, its own peculiar suffering, the wounds of its love, the repentance, mourning, anguish, and penance of its heart.

But we must add that in depicting this pain of soul the *positive* aspect must not wholly be absent. The soul must be assured of the actual and essentially consummated reconciliation between mankind and God, and only experience anxiety that this eternal salvation be realized as a truth in itself. In this connection we not unfrequently meet with repentant people, martyrs, and monks, who, despite of their assuredness of an objective atonement, partly are overwhelmed with sorrow for a heart whose entire surrender they deem to be right, and partly have already made such complete surrender, and yet are always for realizing such reconciliation anew, and consequently for ever imposing on themselves the burden of penances. And we find, therefore, in the artistic treatment of such situations a twofold point of departure. In other words, the artist may, to start with, presuppose in his subject an open disposition, freedom, cheerfulness, and decision of spirit, such as carries with ease life and the yoke of the actual world and knows how to readily deal with the same, then he may fitly associate with such painful experiences a native nobility, grace, freshness, freedom, and beauty of form. When, on the contrary, his work is based upon a natural sense that is more refractory, defiant, savage, and limited, the conflict of the spirit in overcoming the flesh and the world, and securing to itself the religion of salvation will necessarily imply more severe travail. In cases of such obstinacy of soul, therefore, the harsher reflections of force and stability are more apparent, the scars of the wounds which have been inflicted on an obstinacy of this type are more visible and enduring, and the beauty of the physical result tends to vanish[272].

Thirdly, that positive aspect of atonement, the *transfigurement* that results from grief's travail, the blessedness that comes of repentance may be independently accepted as the subject of artistic presentment though it may readily pass into false conceptions.

Such, then, are the main distinguishing characteristics of the absolute spiritual Ideal regarded as the essential content of romantic painting. It forms the material of its most successful and solemn creations, works that are immortal by virtue of the depth of their contemplation; and when the representation of essential truth is thereby expressed they are nothing less than the most exalted expansion of the soul to its heaven of bliss, the most intimate and complete revelation of ideal life that an artist can bring before our vision.

Following this pre-eminently religious sphere of artistic production we have still to investigate two further fields of its activity.

(*β*) In direct contrast to the province of religion we have that which, if we consider it in its isolated abstraction, is equally destitute of the life of soul and God, Nature in its simplest terms, and regarded more definitely in its connection with painting, Nature's *landscape.* We have stated the character of the object of religion to be such that in it the *substantive* ideality of the soul expresses therein the indwelling sense of Love as united to the Absolute[273]. This inward ideality has, however, a further content. It is able to discover in that which is wholly external an accord with soul-life, and can recognize in the objective world as such traits which have an affinity with what is spiritual. Regarded in their immediacy, no doubt, hills, mountains, woods, valleys, streams, meadows, sunlight, moon, and the starry heavens, are simply perceived to be the natural objects they are. But, in the *first* place, these objects have to start with an *independent* interest, in so far as it is the free life of Nature, which appears in them, and produces a sense of fellow feeling in the individual as one who shares that life himself;

and, *secondly*, the particular changes of Nature's moods bring about states in the soul which correspond to such moods. It is possible for man to follow with his own life this animation of Nature and partake in this harmony of soul with its environment, and feel thereby at home in Nature. Just as the Arcadians spoke of a Pan, who made them shudder and frightened in the gloaming of the forest, in the same way the varied conditions of Nature's landscape in its gentle blithesomeness, its balmy repose, its spring-freshness, its wintry chill, its morning awakening and evening rest find their counterfeits in states of the soul. The tranquil depth of the ocean, the possibility that its depths may break forth with infinite power is akin to soul movements, just as conversely the roaring, upwelling, foaming, and break of storm-tossed waves stir the soul with concordant music. It is an ideal significance of this kind that the art of painting accepts as its object. And for this reason it is not natural objects merely as such in their external form and association which ought to constitute its true content, so that painting is nothing more than a mere imitation, but rather the animation of Nature's life, which interfuses it throughout and which is able to bring into prominence and assert with more vividness in the scenes of Nature reproduced the characteristic affinity of specific conditions of this life with particular spiritual states — it is a vital participation in Nature of this kind which gives us the meeting-point, steeped as it is in the soul-life and temperament of the artist, by means of which Nature may become the content of painting not merely as environment, but as possessing a distinct individuality[274].

(*γ*) There is yet further a *third* type of idealization which we find partly in the case where objects wholly insignificant are detached from the position they occupy in the landscape, and, partly, in scenes of human life, which may appear to us not merely as wholly accidental as thus selected, but even of a kind that is both mean and commonplace. I have already

found an opportunity for an attempt to justify the artistic selection of such subjects[275]. I will in connection with painting merely add the following remarks to our former discussion.

The art of painting is not merely concerned with the inward life of the soul, but with that ideal element that is essentially *particularized*[276]. This latter type of ideality for the reason that particularity is its principle is not content to rest satisfied with the absolute object of religion, and as little will merely accept from the external world Nature's vitality and its defined character as landscape; rather it insists on partaking of everything, in which man as an isolated individual soul can take a rational interest and find pleasure. Even in the case of its representations of religious material art, in proportion as it develops, it attaches such more closely to terrestrial conditions and the objects of actual vision, giving to its content the complete presence of natural existence, so that we ultimately find that the aspect of sensuous existence is most important and the interest of devotional life only so in a subordinate degree. For here, too, art receives the task to work out the Ideal in its fullest realization, in other words, to present to our senses that which is originally detached from them, to carry over objects taken from the remoteness of past life into present life and unite them with that present human life.

At our present stage of human evolution it is the ideality which we find in actual life as it faces us, in the circumstances of daily experience, the most common and the most trivial, which is the actual content.

(*αα*) If we inquire, then, what it is that makes a content of this kind, otherwise so poverty-stricken and indifferent, compatible with the claims of art, we must reply that it is the substantive core that is contained and made valid therein, in general terms the vitality and delight of self-subsistent existence, exemplified in the greatest variety of its aims and interests. The life of mankind is always in the immediate Present. What a man may do in

each moment thereof is something specific, and its justification consists in the fact that he carries through all his engagements, the least no less than the greatest, with heart and soul. In this way he is united with each particular incident, and, by infusing into each the entire force of his individuality, appears to identify his whole existence with such. This coalescence[277] produces that harmony of the individual with the specific character of his immediate activity in the circumstances that are nearest him, which is itself a mode of ideality, and which communicates in such a case to the subsistency of an existence, which is an exclusive and perfected whole, its attractive character. The interest, therefore, that we derive from representations of this kind is not to be attributed to the subject-matter, but rather to this animating soul, which by itself, and independently of that wherein it is disclosed as vital, finds an echo in every uncorrupted nature, in every free spirit, and is for the same an object of sympathy and delight. We must not, therefore, impair our enjoyment on the ground that the demand is made of us to admire such works of art under the aspect of their *likeness* to *Nature* so-called and such illusive imitation[278]. This demand, which works of this kind appear at first blush to support, is itself merely a deception which fails to hit the real point. For an admiration of this type is solely deducible from the wholly external comparison of a work of art and a work of Nature, and is only associated with the similarity of the counterfeit with an object or fact presented us, whereas the real content here and the artistic quality in the composition and execution is the coalescence of the matter portrayed *with its own substance*, which is the reality as independently depicted in its vital characterization. According to the principle of illusion, for instance, the portraits of Denner are entitled to our praise, which are, no doubt, imitations of Nature, but for the most part fail entirely to present us that vital animation on which we lay the main stress in these cases, and are mainly concerned with depicting hair, wrinkles, and generally every kind of

trait which, without exactly being indicative of a corpse, are equally remote from the human physiognomy depicted as alive.

Moreover, if we permit ourselves to level down our enjoyment through superficial thoughts of the above fashionable kind, believing subjects of this type to be mean and unworthy of our contemplation, we accept the content by doing so in a form other than that in which art offers them us. In other words we merely associate with them the relation in which we stand to them according to our personal needs, pleasure, such education as we otherwise possess and other objects we have before us, that is to say we merely conceive them in respect to their *external purport*, throughout which it is our own requirements which are the vital thing we aim at for ourselves, and the matter of all importance. The life of the subject-matter itself, however, is thereby destroyed, in so far, that is, as the sole object of its existence appears to be that of a means simply, or lapses into a thing of no moment at all, just because we personally have no need for it. A gleam of sunlight, for example, which falls upon a room we enter through an open door, a part of the country we travel through, a sempstress, a maid we happen to see busily engaged, one and all we may regard with indifference, because we suffer them to pass by remote from the thoughts and interests which are bound up with them, and consequently in our soliloquy, or conversation with another will not suffer the situations which actually lie before us to speak a word in the current of our own thoughts and speech; or we cast what is merely a passing glance at them, the summary of which does not amount to more than the remark, "how pleasant, fine, or ugly they are." Thus we are charmed with the joviality of dance of peasants, while we merely glance at it superficially, or turn away from it with contempt, because we are hostile to "every sort of barbarism." We treat in a similar way the human countenances we come across in our daily life, or which we happen to chance upon. Our own personal point of view, and the various

matters which engage us are for ever being interposed. *We* are forced to address this or that person in a certain way, we have affairs to despatch, we have certain things to consider, thoughts that affect our relation to such a person; we observe him under the particular circumstances of our knowledge; we regulate our conversation relatively to that, or we are silent upon it, if he may be likely to resent it — in short we have always in our minds the man's business, station, and status, and our attitude to and business with him, remaining in a wholly practical relation, or in a position of indifference and preoccupied inattention. Art, however, when it depicts such real life, wholly changes our attitude to it; it cuts away once and for all all practical deviations[279], such as we are wont to associate with such material; it places us simply in the attitude of abstract contemplation to it; and in the like degree it does away with its indifference, and directs our otherwise preoccupied attention wholly to the situation portrayed; upon which we must collect and concentrate all our faculties, if we are to enjoy it. Sculpture, in particular, by virtue of its ideal mode of production from the first strikes off all practical relation to the object to the extent that its product at once betrays the fact that it does not belong to this reality. Painting, on the contrary, carries us wholly into the presence of the daily life with which we are in immediate contact, but it furthermore destroys all the threads of practical necessity, attraction, inclination, or disinclination, which draw us to such a Present, or the reverse, and forces us to approach those objects more intimately as ends to themselves in their own particular phase or mode of life. What we meet with here is just the opposite to that which Herr von Schlegel, for example, in the tale of Pygmalion, expresses so very prosily as the return of the completed work of art to common life, that is to a relation of a man's own inclinations and an actual enjoyment, a return which is the very opposite of that alienation, in which the work of art places the objects delineated in their relation to our practical necessities,

and, precisely by doing so, sets forth before us their own independent life and appearance.

(*ββ*) Just as, then, art, in this particular sphere, re-establishes the forfeited independence of a content, which we otherwise failed to preserve in its unique characteristics, in the same way, *secondly*, it is able to secure in stability such objects as may happen to appear in actual existence in a form we are not accustomed to respect simply as such. The higher Nature stretches in its organization and shifting appearance the more it resembles the actor who only serves the present need. In this connection I have already emphasized the fact as a triumph of art over reality, namely, that it is able to fix that which is most evanescent. This power of art in attaching permanence to *momentary* things applies not only to the sudden flash of life we find concentrated in certain situations, but also to the magical effect of its external presentment in the rapid changes of its colour. A troop of horsemen, for example, may alter every moment in the mode of its grouping, and the mutual relation of each rider within it. If we were one of such we should have something else to do than consider the lively effect of such changes. We should have to mount, dismount, make up our haversack, eat, drink, rest, groom, drink and feed our horses: or, if we looked on as ordinary folk, we should look at such with wholly different interests. We should want to know what they are there for, what nationality they are, for what reason they have left their barracks, and so forth. The painter, on the contrary, smuggles off the most volatile of the movements, the most evanescent expressions of countenance, the most momentary gleams of colour apparent in such motion, and places such before us solely in virtue of its interest in the animation of such phenomena which without it would vanish. For especially it is the play of the colouring, not treated merely as flat tint, but in its lights and shadows, and in the prominence or subordination of the objects painted which is the reason that the

representation appears lifelike, a fact which we are accustomed to observe in works of art less than such an aspect deserves, bringing as it does art first clearly to our minds. And, moreover, the artist preferably accepts in depicting these natural relations the effort of following the least detail, and making his work concrete, definite and stamped with individuality, endeavouring as he does to secure for his subject-matter the individuality which phenomenal life itself supplies in its most momentary flashes; and yet withal does not so much seek for such a detail merely as imitated closely to strike our senses with its directness, but rather to furnish a definite image to the imagination in which at the same time the ideality of the entire composition remains active.

(*γγ*) The more insignificant the objects are, in comparison with the material of religion, which this particular phase of painting accepts for its content, to that very extent it is just this quality of *artistic* creation, the manner of observation, conception, elaboration, the vitality communicated by the artist to his work by all his individual faculties, in short the soul and living enthusiasm of his execution, which constitute a prominent aspect of its interest, and are part of its content. That which the subject treated is under his workmanship must, however, substantially remain what it is in fact and is capable of being. We believe, indeed, that we look upon something different, and novel, because in actual life we do not pay the same detailed attention to similar situations, and their manner of colouring. Looked at on the reverse side no doubt we have something, too, that is new added to such ordinary subjects, namely, just this very enthusiasm, artistic insight and spirit, the soul, in which the artist handles them, adapts them to his uses, and by doing so infuses the enthusiasm of his activity like the breath of a new life throughout all his work[280].

Such, then, are the essential points of view, which it was necessary to discuss in regard to the content of painting.

(*b*) The *second* aspect which we have next in order to examine is connected with the more particular modes of definition, to which the sensuous material, in so far as it has to accept in itself a given content, has to accommodate itself.

(*α*) The *first* of these of importance is the *linear perspective.* This is introduced as necessary, because painting has only the superficies at its disposal and no longer, as was the case with the bas-relief of antique sculpture, can extend its figures side by side on one and the same plane, but has to proceed to a mode of presentation, which finds it necessary to make the remoteness of its objects in all their spatial dimensions merely appear as such to our senses. For the art of painting has to unfold the content it selects, to place the same in its various movement before our eyes, and to associate in different ways its figures with the landscape of external Nature, its buildings and so forth, in a wholly distinct grade of literalness to that which sculpture in the relief is able to secure. And that which painting in this respect cannot place before us in its actual degree of remoteness in the realistic manner of sculpture it must present under the illusion of reality. What we have first to notice here consists in this that the *single* surface which confronts painting is divided into distinct planes, apparently remote from one another, and by this means the contrasts of a near foreground and a remote background are secured, which furthermore are linked together by means of a middle distance. Inasmuch as the objects are, the more distant they are from the vision, proportionately reduced in size, and this deduction follows in Nature itself optical laws capable of mathematical determination, the art of painting, too, has on its part to follow the same rules, which, by virtue of the fact that objects are set forth on one surface, are applicable here in a particular way. And this is the rational ground of the so-called linear or mathematical perspective in the art of painting, whose more detailed exposition, however, it is not our business here to discuss.

(*β*) In the *second* place, however, objects are not only placed at a certain distance from one another, but they also differ in *shape.* This particular mode of their spatial limitation by virtue of which every object is made visible in its particular form is the subject-matter of *draughtsmanship.* The art of drawing gives us for the first time not merely the comparative distance of objects from one another, but their respective configuration. Its most important principle is *accuracy* of form and relative distance, which of course in the first instance is not as yet associated with ideal[281] expression, but related simply to external appearance, and consequently forms the purely external framework[282], an accuracy, however, which, more particularly in the case of organic forms and their varied movements, is on account of the fore-shortenings thereby rendered necessary one of extreme difficulty. In so far as these two aspects are related purely to *form* and its spatial totality they constitute the *plastic* or sculpturesque features in painting, which this art, for the very reason that it expresses what is most ideal in its significance by means of external form, can as little dispense with as it can in another respect remain solely content with. For its supreme task is the employment of colour, and in such a way that in all that is truly painting distance and shape only attain and discover their genuine presentment by virtue of the distinctions of colour.

(*γ*) It is, therefore, *colour*, and the art of colouring, which make the painter a painter. We dwell with pleasure, no doubt, on the drawing, and exceptionally so on the study or sketch, as on that which pre-eminently betrays the quality of genius; but however rich with invention and imagination, with whatever directness the soul of an artist may assert itself in such studies by reason of the more transparent and mobile shell of their form, yet the fact remains to be painting we must have colour, if the work is not to continue abstract from the point of view of its sensuous material in the vital individuality and articulation of its objects. We must, however, at

the same time admit that drawings and dry point drawings from the hand of great masters such as Raphael and Albrecht Dürer are of real importance. In fact from a certain point of view we may say that it is just these hand drawings which carry with them the finest interest. We find here the wonderful result that the entire spirit of the master is expressed directly in such manual facility, a facility which places with the greatest ease, in instantaneous work, without any preliminary essays, the essential substance of the master's conception. The border drawings of Dürer, for example, in the Prayer-book of the Munich library, are of indescribable ideality and freedom. Idea and execution appear in such a case to be one and the same thing, whereas in finished pictures we cannot avoid the sense that the consummate result is only secured after repeated over-paintings, a continuous process of advance and finish.

In despite of this, however, it is only through its employment of colour that the art of painting is able to give a real and vital presentment to the wealth of soul-life. All the schools of painting have, however, not retained the art of colouring at the same high level. It is a significant fact that we may, with an exception here and there, assert that it is only the Venetians and the Dutch[283] who have become consummate masters in their use of it. Both peoples were linked to the sea-coast, both situated on a low-lying land divided by fens, streams, and canals. In the case of the Dutch we may find an explanation in the fact that, on account of their having so perpetually a cloud-covered horizon, their conception of a gray background became fixed in their minds, and owing to this very gloomy prepossession they were the more driven to study colour in all its effects and variety of lighting, shadow, and chiaroscuro, to emphasize this and to discover in this the main task of their artistic efforts. In contrast to that of the Venetians and the Dutch the painting of the Italians generally, if we except that of Correggio and one or two others, appears to be more dry, sapless, cold, and lifeless. Looked at

more closely we may emphasize the following points in connection with the art of colouring as the most important.

(*αα*) In the *first* place we have the abstract basis of all colour in *light* and *dark.* When we posit this contrast and its transitions by themselves without further distinctions of colour effect, we get thereby simply the contrasts supplied us by white as light and black as shadow together with their transitional grades and nuances, contrasts which offer to the art of drawing its integrating quality, appertaining as they do to the real plastic character of form, and producing the prominence, retreat, rondure, and distance of objects. We may incidentally mention in this connection the art of engraving on the plate which is wholly concerned with light and shadow as such[284]. Apart from the infinite assiduity and labour it implies we find in this highly valuable art, at the point of its supreme attainment, soul intimately associated with the utility of great variety of form[285], a variety which the art of bookbinding also possesses. Such an art, however, is not wholly occupied with effects of light and shade as that of simple draughtsmanship is; it endeavours further in its elaboration to become distinctly a rival of painting, and in addition to light and shade such as is purely the effect of illumination, also strives to express those distinctions of more emphatic light and darkness which are primarily the result of local colour; we find, for example, in a copperplate engraving that an attempt is made by its use of light effects to render visible the distinction between blond and black hair.

In painting, however, as already remarked, mere light and darkness only supply the fundamental basis, albeit such a foundation is of the greatest importance. For it is this contrast and only this which defines the comparative prominence and retirement, the rondure, and generally the actual appearance of form as sensuous shape, all that we understand by *modelling.* Masters of colour in this respect simply carry the process to the

most extreme contrasts of the most brilliant light and the deepest shadow, and merely produce thereby their grand effects. Such contrasts are, however, only permissible in so far as they avoid harshness, that is, in so far as they are made within the limits of a just interplay of intermediate tones and colour transitions, which bind the entire composition in a fluid unity and render the finest gradations of tint possible. If such contrasts are entirely absent the entire effect will be flat, because it is precisely this distinction between that which is more brilliant and more obscure which gives emphatic prominence to particular aspects of the work and a like subordination to others. And especially in the case of compositions having a large content, and where the distance between objects is considerable, it is necessary to introduce the deepest shadow in order to make the scale of light and shadow a broad one.

With regard to the closer definition of light and shade we find that this depends more than anything else upon the mode of *lighting* accepted by the artist. The light of day, that of morning, noon, and evening, sunlight or moonlight, a clear or clouded sky, the light of tempest, candle-light, a light that is veiled, or falls upon the object or diffuses itself gradually, every conceivable mode of lighting, in short, is possible, and the cause of every kind of effect. In treating a subject of public interest, full of incident, a situation that at once appeals to our common sense, the question of external lighting is of subordinate importance. The artist will avail himself here with most advantage of ordinary daylight, if, that is, the demands of dramatic vividness, and a desire to emphasize particular figures and groups, or to throw into the background others, do not render a less usual mode of lighting necessary, which may fall in more readily with such objects.

The great painters of the earlier school have consequently as a rule made little use of such contrasts or specific schemes of lighting. And they did rightly, inasmuch as their emphasis was rather on the spiritual aspect as

such than on the sensuous impression of their pictures. And on account of the pre-eminent ideality and spiritual significance of the content they were able to dispense with the aspect of their work which inclined more or less to the material side. In the case of landscapes, on the contrary, and subjects of less importance taken from ordinary life, the question of lighting makes a very different appeal. In these important artistic and, often, artificial and mysterious effects are indispensable. In the landscape the bold contrasts between large masses in illumination and other parts in the strongest shadow will receive their full effect, but tend also to develop the artistic mannerism. Conversely we find, more especially in the treatment of landscape, reflections of light, the flash and its counterfeit, that wonderful echo of light, which arises from the interplay of light and dark, and offers an ample and progressive subject of study both to the artist and the spectator. Such a scheme of lighting, which the artist has either by direct imitation or imaginatively conceived in his work, can, however, by itself only be a transient one, which is subject to rapid change. However sudden or uncommon the lighting thus permanently retained may be, the artist must see in the treatment of his composition, even though it be as full of movement as possible, that the whole, despite all its variety, is not injured by mere restlessness and wavering motive, but is throughout clear and marked with unity.

(*ββ*) In accordance with what has already been stated the art of painting, however, has not merely to express light and dark in its purely abstract intension, but to add to it the distinctions of colour. Light and shadow must be coloured light and shadow. We have therefore in the *second* place to discuss colour simply.

The *first* point we have to deal with here is the *brightness* and *obscurity* of particular colours respectively to one another, that is in so far as they are operative as light and dark in their varied relations, and either emphasize or

suppress and impair their individual effect. Red, for example, and still more yellow, is at an equal grade of intensity more brilliant than blue. This is dependent upon the nature of the colours themselves, which in recent times Goethe has for the first time fully explained[286]. In other words, we find that in blue *shadow* is of main significance, which, in its first operation through a brighter, but not as yet fully transparent medium, appears to our sight as blue. The sky, for example, is dark, and on the highest mountains it is yet darker. Seen through a transparent but thick medium, such as the atmosphere of its lower planes is, it appears as blue, and its brightness increases in proportion as the air is less transparent. In the case of yellow, on the contrary, essential brightness works through a density, which, however, suffers this brightness to shine through it. Smoke, for example, is such an obscuring medium; looked at in front of anything black which works its way through it, it appears of a bluish tint, and before anything bright it appears yellow and reddish. Genuine red is the actively royal and concrete colour, in which blue and yellow, themselves also extremes of opposition, press together in fusion, We may also regard green as such a union, not, however, in a unity that is concrete, but merely as a difference that is cancelled, as a medium of satiated and tranquillized neutrality[287]. These colours are the purest, simplest, and original *cardinal* colours. We may consequently find a symbolical significance in the way that the old masters made use of them. Especially is this so in their use of blue and red. Blue corresponds with the milder, sensuous, more tranquil aspect, a contemplation which is rich in feeling, in so far as it has obscurity for its principle, and offers no resistance, whereas the brightness therein rather suggests that which resists, produces, is alive and blithesome. Red corresponds with what is masculine, dominant, and royal, green with that which is indifferent and neutral. According to such symbolism for example, the Virgin Mary is frequently clothed in red where she is enthroned, and set

before us as queen of heaven; where she is depicted as mother, she wears a blue mantle[288]. All the other colours in their endless variety must be regarded as mere modifications of the above, in which we must recognize a certain degree of shadow fused with the cardinal colours. In this sense no painter would call violet a colour[289]. Furthermore all these colours, in their mutual relation to each other, are respectively of greater brightness or obscurity, a fact that the artist must bear in mind if he is not to fail in getting the just tone which any particular section of his modelling or distance effects ought to have. In other words we have here a source of exceptional difficulty. In the countenance, for example, the lip is red, the eyebrow dark, black, brown, or, if blonde, at least darker as such than the lip; in the same way the cheeks with their reddish tint are more brilliant in colour than the nose, with its main impression of yellow, brownish, or greenish tint. Such portions of the face can readily receive a greater brightness and intensity owing to this local colour than is consonant with their modelling as parts of the whole. In sculpture, indeed in mere drawing too, such parts of a composition receive their light and shadow wholly in reference to their particular form and its manner of lighting. A painter on the contrary must accept their local colouring, and this disturbs such a relation. Such a difficulty is even more obvious between objects more removed from one another. For the ordinary vision of sight it is our mind which determines the distance and form of such objects, not merely by means of their colour appearance, but also on a variety of other grounds. In painting, however, all that we have before us is colour, which as such is able to interfere with that which is demanded by mere brightness and darkness as such. The art of the painter, therefore, consists in his ability to resolve this contradiction, and so to arrange his colours that neither in their local tints, nor in their mutual relation in any other way, they impair the modelling as a whole. Only if success is secured in both respects are we likely to see the actual shape and

colour of the objects realized in perfection. With what consummate art, for example, have the Dutch painted the sheen of satin dresses with all their variety of reflections and gradations of shadow in their folds, or the flash of silver, gold, copper, vessels of glass and velvet; and in the same way we may mention the lighting a Van Eyck gives to his jewels, gold borders, and metals. The colours by means of which the flash of gold is presented have nothing of metallic about them: looked at closely we merely see yellow, which by itself is of no great brightness. The entire effect is due on the one hand to the prominence of the form, and on the other to the contiguity of the mutual gradations of distinct colour tones.

A further aspect in the *second* place is the *harmony* of the colouring.

I have already observed that the very nature of the facts necessitates that colour should have itself an articulated system. And this complete result should appear. No fundamental colour should be wholly omitted, otherwise our sense of this integrated whole is lost. To an exceptional degree the old Italian masters and the Dutch satisfy us in this respect. We find in their pictures blue, yellow, red, and green[290]. It is this completeness which supplies the basis of our colour harmony. The colours, moreover, must be so arranged that not merely their artistic contrast, but also their mediation and resolution, and a repose and reconciliation as the result of such, is made visible to the sight. Such effective contrast and repose in conciliated extremes is brought about partly by the way the colours are associated, and partly by the degree of intensity which characterizes each colour. In early painting it was principally the Dutch school[291], which employed the cardinal colours in their purity and their unimpaired brilliance, by which means the harmony is rendered more difficult by reason of the emphasis laid on contrast, but when secured should be pleasing to the eye. Where, however, the decisive character and force of colour is insisted on the nature of the subject-matter itself should be more definite and simple. And by attending

to this a higher degree of harmony between colouring and content is also obtained. The important personages, for instance, must receive the colour that is most emphatic, and in their characterization, their entire deportment and expression should appear more imposing than the subordinate figures, who will receive merely the composite colours. In landscape painting the contrast of pure cardinal colours is less pronounced. In scenes, on the contrary, in which human figures are of most importance, and more particularly where drapery occupies large spaces of canvas, the more simple colours will be in their right place. In such we have a scene taken from the world of spiritual life, in which that which is inorganic, the natural environment, is more abstract, in other words must not appear in its natural completeness and isolated manner of effect, and the varied tints of landscape in all the profusion of their gradations are less suitable. As a rule the landscape is not so entirely fitted to the environment of human scenes as a room, or generally that which is architectural, inasmuch as situations which take place in the open air are in general not accepted from a class in which the life of soul without considerable reserve is manifested. If a man is placed before us with the open landscape around him it should appear simply as environment. And in cases of this type it is right to make use of colours that are exceptionally prominent. But the use of such involves also boldness and power of execution. Sickly sweet, overpowered[292], doting faces are not the kind for such treatment. Such soft expressions, such over-diluted countenances, which, ever since Mengs gave them as people are wont to think typical of ideality, would be entirely pulverized by such decision of colour. In recent times and among us Germans, weak faces which have essentially nothing to say[293], carefully posed in ways that imagine themselves to possess grace, simplicity, and imposing character, are all the fashion. This lack of distinction, on the side of spiritual characterization, has its counterpart in and indeed produces a similar lack of

definition in colour and tone, so that all colours are run together in one confusion, and forceless condition of mutilation and evaporization, and no real emphasis is laid on any. You cannot say that one suppresses another exactly, but then none adds contrast to another. It is no doubt a colour harmony of a kind, and frequently it impresses with its excessive sweetness and flattering endearment, but the note of distinction is absent. In this connection Goethe thus expresses himself in his observations added to the translation of Diderot's essay on painting: "Critics do not by any means admit that it is easier to make weak colour harmonious than a strong scheme: but it stands to reason when colour is strong, when colours are placed before us vividly, in that case the eye will experience their harmony or discord with greater vividness. If, however, we weaken our colours, employ some with brilliance, others in fusion, others in obscure squalour, then it is obvious no one will be able to say whether the picture he looks at is harmonious or not. One thing in any case we can say of it, it lacks distinction."

With harmony of colour, however, we have not by any means attained the goal of the art of colouring. To reach this consummate effect, in the *third* place, several other aspects must not be neglected. In this respect I will restrict my observations to three points, first, the so-called *atmospheric perspective*, secondly, *flesh-colour*, and in conclusion, the magic of *colour brilliancy.*[294]

Linear perspective is connected in the first instance merely with the different degrees of size, which the lines of objects possess in their greater or less remoteness from the human eye. This alteration and reduction of form is, however, not the only thing painting has to reproduce. In Nature everything is affected by the presence of atmosphere, not merely between different objects, but even different parts of them, a difference which asserts itself in colour. This tone of colour which thus as it were evaporates with

the distance is what constitutes *atmospheric perspective*, in so far as thereby objects are modified partly in deliberate outline, and partly in respect to their light and shadow and general colouring. As a rule people think that what is nearest to the eye in the foreground is brightest, and what lies in the background is more obscure; in truth the matter is otherwise[295]. But lights and shadows in the foreground are strongest, in other words the contrast between light and shade has a more powerful effect, and outlines are more defined near to the spectator. In proportion, however, to the degree of their remoteness, they lose in definition of colour and form, because the contrast of their light and shadow is gradually reduced, until finally everything disappears in transpicuous gray. Different schemes of lighting, however, necessitate in this respect various modes of treatment. In landscape painting more especially, but also in other compositions, which present large spaces, atmospheric perspective is of first importance, and the great masters of colour have carried out by this means the most bewitching effects.

The most difficult achievement in colouring, the ideal and consummation of its art, is the colour effect of the human flesh[296], which unites in its perfection all other colour tones, without permitting any particular one to be singly prominent. The healthy red in the cheeks of youth is, no doubt, pure carmine without any admixture of blue, violet, or yellow, but this red is itself only a flush, or rather a sheen, which appears to rise on the surface, and imperceptibly passes into the prevailing flesh-tints. And this is an ideal[297] commixture of all the fundamental colours. Through the transparent yellow of the skin the red of the arteries and the blue of the veins is visible, and along with the light and shade and all the variety of sheen and reflection we have further tones of gray, brown, even green, which at first sight appear as contrary to Nature, but for all that may contribute to the justness and truth of the effect. Moreover, this composite

treatment of many apparent tints is wholly without sheen as such, that is, it reflects nothing alien to it on its surface; its vital quality is entirely a result of itself and the living thing it is. It is this rendering of that which is the life shining through the organic integument which constitutes the main difficulty. We may compare it to a lake in the evening glow, in which we behold the objects that it reflects[298] no less than the clear depth and native character of water. The flash of metal combines on the contrary, no doubt, both light of its own and transparency, jewels both flash and are translucent, and something similar is seen in the case of velvet and silk-stuffs, but none of these approaches the life-conferred interfusion of colours apparent on the surface of the living flesh. The skin of animals, whether hair or hide, wool, and so forth, are in like manner of the most varied colouring, but it is a colour capable of more direct and independent definition in its parts, so that the variety is rather the result of different surfaces and planes, it is not a single transfusion and suffusion of many colours such as human flesh is. The nearest approach to it perhaps is the interplay of colour visible in the bunch of grapes, or the exquisitely tender gradations of translucent colour in the rose. And yet even this last example is unable to give us the counterfeit of ideal animation[299] which flesh-colour should possess. It is this volatile emanation of the soul exhibited on a non-transparent surface which is one of the most difficult problems of painting. For this ideality, this reflex of the inward life of soul must not appear on a surface as imported there, must not be pasted there as so many streaks, hatchings, and so forth of material colour, but seem to us itself to belong to the living whole[300], a transparent depth, as the blue of heaven, which offers our vision no repellent surface, but one in which we are infallibly invited to unfold. Already Diderot, in the essay on painting translated by Goethe, expressed himself as follows on this head: “He who once has truly felt and secured the apparition of flesh-colour

is far on his way to perfect victory. Thousands of painters have died without such a feeling, and many thousands more will die without doing so."

In so far as the material is concerned, by means of which this untransparent vitality of flesh is reproduced, the first medium to declare its suitability for such an effect was the oil-pigment. Work in mosaics is of all the least fitting to present us such a composite effect. Its permanency is no doubt a recommendation, but inasmuch as it can only express colour gradations through variously coloured glass cubes or stones placed in juxtaposition, it is wholly unable to reproduce the intermingling flow of one unified presentment of many colours. Fresco and tempera painting carry us considerably further in this direction. Yet in the case of fresco-painting the colours are put on the wet plaster with too great rapidity, so that, on the one hand, the greatest facility and sureness of brushwork is an essential, and, on the other, the work has to be carried out with broad adjacent strokes, which on account of their drying so rapidly do not admit of a fine degree of finish[301]. The same kind of difficulty meets us in the case of tempera-painting, a process[302] which no doubt admits of great lucidity of expression[303] and beautiful contrasts of light and shadow, yet for all that, by reason of the fact that its medium dries so quickly, is less adapted to the fusion and elaboration of its effects, and necessitates an articulate surface made up of definite strokes of the brush. The oil pigment, on the contrary, not only permits of the most tender and subtle melting together and elaborate fusion of colour effect, so that transitions are so imperceptible we cannot say where one colour begins and where it leaves off, but it is, where its component elements are properly fused and the execution of it is as it should be, itself remarkable for a luminous quality like that of precious stones, and it can, by virtue of its distinctions between opaque or transparent colours[304], reproduce in a far higher degree than tempera painting the translucency of different layers of colour.

The *third* and last point for our consideration in this connection is the emanation[305] and *mystery* of colour in its entire effect. This witchery of colour appearance will mainly be found, where the substantive ideality of objects has become an effusion of spirit which enters into the scheme and treatment of its coloured presentment. In general, we may say that the magic consists in a handling of colour by means of which we obtain an interplay of scenic effect which is devoid of defined articulation as such, which is, in fact, simply the result of moulding of colour in the finest degree of fluency, a fusion of coloured material, an interplay of reflected points which pass into one another, and are so fine and evanescent in their gradations, so full of vital cohesion that the medium here seems already to have entered that of musical sound. From the point of view of modelling the mastery of chiaroscuro is part of this magic result, an aspect of the art in which among the Italians Leonardo da Vinci and, above all, Correggio were supreme. While introducing the very deepest shadow, the transparency of this is not only preserved, but is carried through imperceptible gradations to the most brilliant light. By this means roundness in the moulding of form is complete; there is no harshness of line or limit, but all is equable transition. Light and shadow are not here merely in their immediate effect as such, but gleam through one another much as a spiritual force is operative through an external shell. It is just an effect like this we find in the artistic treatment of colour, and the Dutch were no less than others consummate masters of this. By virtue of this ideality, this mutual relation between the parts, this interfusion of reflections and colour scintillations, this alternation and evanescence of transitional tones, a breath of soul and vitality is throughout communicated in the brilliancy, depth, the mild and juicy illumination of colour. It is this which gives us the magic effect of a masterpiece of colour; it is the unique gift of the genius of the artist who is himself the magician.

(*γγ*) And this brings us to the last point we have to discuss on this part of our subject.

We started with the *linear perspective*, we passed on then to *drawing* and concluded with *colour*; *first* considering light and shade in its relation to modelling, and, *secondly*, viewing it as colour simply, or more accurately, as the mutual relation between degrees of brightness and darkness in colours, regarding it, moreover, in its aspects of harmony, atmospheric perspective, flesh-colour and magical effect. We have now to consider more directly[306] the *creative impulse* of the artist in bringing about such colour effects.

The ordinary view is that the art of painting follows definite rules in attaining its results. This is, however, only true of the linear perspective, being as it is a wholly geometrical science, and even in this case rules must not obtrude themselves in their abstract stringency, if we are to preserve all that essentially contributes to our art. And, in the second place, we shall find that artistic drawing accommodates itself even less readily than perspective to universal rules, but least of all is this true of colouring. Sense of colour ought to be an artistic instinct or quality, should be as much a unique way of looking at and composing existing tones of colour, as it should be an essential aspect of creative power and invention. On account of this personal equation in the production of colour, the way, that is, the artist looks at and is active in the making of his world, the immense variety which we find in different modes of treating, it is no mere caprice and favourite mannerism of colouring, which is absent from the facts *in rerum natura*, but lies in the nature of the case. Goethe supplies us with an example of personal experience which, as confided in his "Dichtung und Wahrheit," illustrates what I mean: "As I returned to my cobbler's house (he had just visited the Dresden Gallery) once more to take lunch I could scarce trust the evidence of my eyes. I believed myself to see before me a picture

of Van Ostade[307], so complete it was, that you might have hung it there and then in the Gallery. Composition of subject-matter, light, shadow, brown tone of the whole, all that is admirable in this artist's pictures I saw actually before me. It was the first time that I was aware, to such a high degree of the power which I subsequently exercised with intention, the power of seeing, that is, with the eyes of the particular artist, to whose works I had just happened to devote exceptional attention. This facility afforded me great enjoyment, but also increased the desire from time to time to persevere in the exercise of a talent which Nature seemed ungracious enough to disallow me[308]." This variety in the manner of colouring is exceptionally conspicuous in the painting of human flesh, quite apart from all modifications rendered necessary by the mode of lighting, age, sex, situation, and the like considerations. And for the rest, whether the subject depicted be daily life, outside or within the interior of private houses, taverns, churches, or other buildings, or it be that of Nature's landscape, with its wealth of objects and colour, which finds more or less accurate reflection in the personal essay of any particular painter, the result cannot fail to illustrate this varied play of form and colour effect[309], which will infallibly appear, due as it is to the manner in which each comprehends, reproduces, and creates his own work according to his own outlook, experience and imaginative powers.

(*c*) We have hitherto, in discussing the several points of view which are given effect to in the art of painting, referred, *firstly*, to its content, and *secondly* to the sensuous medium in which such content can be built up. We have in conclusion to define the mode under which the artist is bound to conceive and execute his content as a painter and under the conditions of his particular medium. We will divide the very considerable matter which such an investigation implies in the following manner:

First, we have to deal with the more *general* distinctions in forms of *conception*, which it will be necessary to classify and follow in their progressive advance to richer manifestations of life.

Secondly, we shall have to direct attention to the more definite aspects, which, within these general types of conception, are more directly referable to genuine pictorial *composition*, that is, the artistic motives apparent in the particular situation and manner of grouping selected.

Lastly, we propose to review rapidly the mode of *characterization*, which results from distinctions of subject-matter no less than modes of conception.

(*α*) With respect to the most generally prevailing modes of artistic conception[310], we shall find these are in some measure due to the content which has to be depicted, and in part are referable to the course of the art's evolution, which does not from the first seek to elaborate all that is apparent in any subject, but rather through a variety of stages and transitions makes itself fully mistress of Life and its manifestations.

(*αα*) The first position which the art of painting is able to secure still betrays its origin from sculpture and architecture: in the *entire mode* of its conception it is still in close association with these arts. And this will pre-eminently be the case where the artist restricts himself to individual figures, which he does not place before us in the vital connections of an essentially concrete situation, but in the simple independence of its self-repose. Out of the many sources of content which I have indicated as adapted to painting, we shall find religious subjects, Christ, his apostles, and the like are exceptionally suited to such abstract treatment. Such figures as these must necessarily be assumed to possess sufficient significance in their isolation, to be complete in themselves, and to unfold an object sufficiently substantive of adoration and love. Belonging to this type, particularly in early art, we meet with examples of Christ or his saints isolated without

definite situation and environment. If we do find the latter it mainly consists in architectural embellishments, particularly Gothic; this is frequently the case in early Flemish or upper German art[311]. In this relation to architecture, among the columns and arches of which such figures as the twelve apostles and others are frequently composed, painting does not as yet attain to the life-like actuality of its later development, and we find that even the figures still retain in some measure a character which inclines to the statuesque, or to some extent do not move beyond such a general type as we find indicated in its fundamentals by Byzantine painting. For isolated figures of this character, devoid of any background or only retaining a purely architectonic outline, a more severe simplicity of colour, and a more emphatic brilliancy, is as it should be. The oldest school of painters have consequently employed a single-tinted ground of gold instead of a rich natural landscape, a ground which the colours of drapery have to confront, and to which they are compelled to adapt themselves; these are consequently more decisive and glaring than the colours employed in the periods of Art's finest bloom, just as we find as a rule that simple vivid colours such as red, blue, and the rest are most pleasing to uncultivated people.

To this earliest type of conception it is that for the most part the miracle-working pictures belong. To such as to something stupendous man is merely placed in a relation of stupidity, from which the aspect of their artistic merit vanishes, so that they are not brought nearer to his conscious life in friendly guise in accordance with their vital humanity and beauty, and the very pictures which are most revered in a religious sense are from an artistic standpoint the most execrable.
